The following is a brief summary of the results obtained in the orchards near Riverside as detailed above:

1. The preliminary examination of the land of the orchard before irrigation showed that the upper two feet held only about 3.5 per cent of free water as the general average, while below this to the depth of 13 feet the average was 6.16 per cent. The roots of the trees were mostly confined to the upper four feet and in this depth there was an average of 4.68 per cent, an amount sufficient to maintain a good appearance in the trees but not to produce new growth; the application of irrigation water caused increased growth.

2. The unobstructed movement of water in loam soils is downward, with great irregularity in rate of progress and in the amount of water retained at various depths. The water beneath the surface does not move from the furrows toward the trees for more than two feet, and at a depth below two feet the wet area is usually rapidly contracted to a cone shape. The soils in the tree rows, therefore, fail to receive any of the irrigation water, and the dry space increases in width and extent downward; the tree roots, which usually are confined to the upper three feet, are thus only partially supplied with needed moisture.

3. The relative proportion of dry soil to that wetted by irrigation across 16 furrows and four tree rows in the sandy loam soil, was as two to three in a depth of five feet. As seen in the profiles, the proportions are as follows, taking the dry soil as the unit: Surface foot, 1 to 3.4; second foot, 1 to 4.3; third foot, 1 to 2.3; fourth foot, 1 to 0.8; fifth foot ,1 to 0.4; and sixth foot, 1 to 0.1.

4. The depth reached by the percolation of irrigation water depends on the nature of the soils and length of time of flow; in the unobstructed loose soil it was 26 feet near the head ditch, four feet in the middle, and about the same at 30 feet from the end, and many feet where the excess was received. In the compact, semi-impervious soil it reached a depth of four feet, while in the impervious hardpan soil the depth was but little more than 12 inches even after three day's application.

5. The amount of water held by the soil when the downward movement ceased was always greatest in the upper two feet and diminished in percentage to the bottom. Thus in the general average of the long trench in orchard 58 we found under the nine furrows 9.95 per cent in the first foot, 11.19 in the second, 9.14 in the third, and 8.27 per cent in the fourth foot.

6. The presence of an impervious hardpan near the surface causes sidewise seepage of the water, a greater wetting of the surface and consequent increased loss by evaporation and by accumulation and run-off at the lower end of the furrows.

7. Shallow irrigation furrows do not give as good results as deep ones; they allow a large part of the water to rise by capillarity to the surface on either side and thence to escape into the air by evaporation, while deep furrows enable the soil to receive and retain nearly all of the water applied.

The furrows in orchard 58 had an average depth of three or four inches and from these the lateral seepage was so great as to wet about 85 per cent of the space between the tree rows. During the three days of irrigation in which these soils were being kept wet the rate of evaporation was very high. After this the soil gradually dried out and the loss diminished.

8. On loose sandy loams water percolates with such rapidity near the head ditch that a great part is lost by passing far below the roots and possibly into sand and gravel strata, through which it flows away. Thus on orchard 58 the depth of percolation was 26 feet at a distance of 30 feet from the ditch.

It is extremely doubtful that water at a depth of more than five feet below the root systems will be of any benefit to the trees in times when needed, for the capillary rise is extremely slow, and especially so if the temperature of the soil be low. Observations made at the time of this investigation in July, when the air temperature was 102 degrees F. in the shade and that of the surface soil 109 degrees F., showed a difference of 28 degrees at a depth of one foot and 42 degrees at 13 feet. The following is the record.

Temperatures of a Soil Column in July.

Depth Feet	Degrees F.	Depth Feet	Degrees F.
Surface	109.0	7	70.5
1	81.0	8	69.50
2	77.0	9	69.00
3	74.5	10	68.25
4	73.5	11	68.00
5	73.0	12	67.50
6	71.5	13	67.25

In another part of the same orchard in July when the temperature of the surface was 130 degrees F., that at 13 feet was 69 degrees F.

9. In orchards with shallow mulches it was observed that the amount of water in the soil six weeks after irrigation was about the same as just previous to the application of water.

The rapidity of movement of water into a soil from the irrigation furrow and the rate at which it is carried into the lower soil strata is a matter of special importance to the trees whose roots must be in contact with it and to the orchardist who wishes the soil to absorb all it possibly can and thus avoid waste by either run-off or evaporation into the air. Beyond this the orchardist, as a rule, seems to have no thought and takes for granted that the soil distributes the water properly to the roots. The fallacy of this reliance on the soil has been frequently proven by examination after irrigation, when it was shown that the

BENEFIT OF HUMUS.

In one of Dr. Loughridge's Institute lectures, he gave the following points:

"Humus," is the chemical name for the substance left in the ground after the decay of the fertilizer. To get the greatest benefit from your fertilizer, to get humus in the largest possible quantity the ground should be moist when the fertilizer is plowed under. When the ground is dry only a small amount of humus results from the turning under of fertilizer. When the fertilizer lies upon the surface in the sun for a period, much of the benefit is lost, as it forms but a small quantity of humus when plowed under. Always have your ground moist when plowing under fertilizer of any kind.

Benefit of Humus.

"Humus benefits the soil in many ways.

"It makes soil looser, lighter, thus aiding in ventilation and allowing poisonous gases to escape.

"It keeps soil from becoming overheated.

"It is valuable in clay because by lightening the ground it makes it easier to work.

"It is valuable in sandy soil, as it helps to bind it together and give it more substance.

"It changes minerals that are in the soil to plant food.

"It holds nitrogen in the soil and nitrogen is the most valuable ingredient in the soil and the costliest to buy as fertilizer.

"It is the home of beneficial bacteria.

"It helps the soil to retain moisture.

"Plow your ground deeply, as this enables the humus to get deeply into the soil where the long roots will get the greatest benefit from it."

Plow Deep.

"In eastern soils the humus is seldom found more than six or eight inches below the surface, but in California, it is often found at a depth of six or eight feet rendering our soil, as a rule, vastly richer than eastern soil. Tree roots should be encouraged to grow deeply by deep plowing. The deeper the root of the tree grows, the less fertilizer will be needed upon the surface, for the more food they will bring up from the depths. Always plow an orchard deeply also, to break any shell, hardpan or plowsole that may form a short distance below the surface and tend to keep water from sinking down.

"It is generally conceded that the humus found deep in the ground, as it frequently is, far below the level of the deepest plowing, is carried there by earth worms.

"It has been proven beyond a possible doubt that earth worms were an important factor in keeping soil rich and growing large crops. Experiments with rye showed that soil where these worms were present in large quantities produced a 90 per cent larger crop than a neighboring tract from which all worms had been taken. With peas the increase was 300 per cent under the same conditions.

Select Plants.

"In selecting green fertilizer, choose the plants that contain the chemicals your soil needs. Some plants contain more of one thing, some of another; you should sow the one that will meet the needs of the particular place where it is to be plowed under. Clover, alfalfa, vetch, are rich in nitrogen and are therefore good fertilizers for most places, as most land is deficient in nitrogen. You should choose a plant that returns more to the soil than it takes out, otherwise nothing is gained by plowing it. Green manures, or plants grown for fertilizing purposes should be plowed under in the spring; therefore, plant in the fall. They should always be turned under when it blooms, as it then contains the largest per cent. of nitrogen, and is easily assimilated by the soil. If left longer the plant becomes woody and does not decay readily.

AVOCADO.

The avocado known by many names in the various tropical countries of America is a salad fruit, occupying a place more nearly comparable with the olive than any other fruit. In the markets of the United States it is sometimes called "avocado pear" and "alligator pear," but the name "avocado" is now more generally used than either of the others There is no good reason for continuing such a barbarism of language as "alligator pear," since the term "avocado" is sufficiently distinctive, and the word "pear" is altogether a misnomer. Mr. G. N. Collins, in his paper on this fruit, shows that no less than 43 common names are applied to it, though it is almost unknown outside of the American tropics. This speaks volumes for its popularity.

Chemical analysis brings out the fact that the ripe fruit contains from 10 to 15 per cent of fat, clearly indicating its value as a food. As a breakfast food it is of superior excellence. Adding pepper and salt as condiments and a teaspoonful of lime juice makes it a dish to please an epicure. However much it may fail to please on first trial, one is almost certain to become extravagantly fond of it if he continues to live in the tropics. It is, indeed, the rare exception to find a person living in the section where good ripe fruit may be obtained in quantity who is not extremely fond of the avocado. Fruits picked green and ripened in a crate are as far from the real thing as are green tomatoes from ripe ones. Then, too, there are as great varietal variations as in other cultivated fruits. The tree is easily budded and readily transplanted, so there is no need of planting and growing seedling orchards. A variety lately imported from Mexico by the Bureau of Plant Industry has passed through a freeze of 15.5 degrees Fahrenheit with a loss of only the smaller limbs. This hardiness greatly increases the possibilities of extending the range of this fruit.

Uses of the Fruit.

The most primitive way of using the avocado is to cut it into halves, remove the seed, and dip out the meat with a teaspoon; it should cut readily, and yet should come out neither oily nor mushy. A rancid avocado is simply nauseating, and a green one not edible. The addition of salt and pepper in no wise detracts from its flavor, and the novice may prefer to add a teaspoonful of lime juice, lemon juice, or vinegar to give it piquancy. A very small quantity of sugar may

be used to reduce the sharpness of the acid. Mayonnaise, or even oil, is sometimes added, but this would seem entirely superfluous, since the fruit already contains so large a percentage of fatty matter. People accustomed to the use of sugar and cream with fruits sometimes add these. In hotels and restaurants the avocado is often cut into small cubes or thin slices and served in small dishes. This is done to economize the fruit as a single avocado will fill six such dishes, while if served in the "half shell" it would suffice for only two people. The dressing or condiments used when sliced are the same as when served in the half shell. The ripe fruit, cut into cubes a half or a third of an inch in size, is frequently mixed with minced salads. At times it is added to lobster and shellfish salad to which it imparts a pleasing nutty flavor. In Mexico and other Central American countries small cubes of avocado are added to soup as it is served. This imparts to the soup an agreeable nutty flavor that is pleasing to the novice.

A mixed sweet pickle made up largely of avocado cubes has been prepared. Thoroughly ripened fruit was chosen and prepared before it had softened, as otherwise it would have become mushy in cooking.—Year Book of Dept. of Agriculture.

FLORIDA ORANGE MEN ORGANIZE

The most important assemblage of citrus fruit growers that ever came together in Florida met last Friday in Tampa. The object of the meeting, which had been widely advertised, was to hold a free and open discussion of the unsatisfactory conditions that have prevailed in the orange growing industry in this state during the past few years, and to devise some effective remedy whereby the orange growers might realize a reasonable profit on the output of their groves. The meeting was very largely attended, many of the leading growers from all parts of the state being present. Josiah Varn, president of the Florida Orange Growers' Company, was instrumental in calling the meeting and arranging for an interesting program of speakers.

The most important feature of the meeting was the forming of a permanent organization, which will endeavor to bring to its support all the citrus fruit growers in the state and which will try to bring order out of the chaos that at the present time fitly characterizes the situation. Mr. Varn was elected secretary of the organization, which is as yet without a name, and which is but the forerunner of the perfected organization which will be brought about later in the summer. After some discussion it was decided to send a committee to California for the purpose of investigating the organizations there that their best features may be incorporated in the Florida organization.

The committee named is composed of Dr. F. W. Inman, Florence Villa, chairman; L. B. Skinner, J. W. Sample, L. W. Tilden, H. E. Heitman, J. J. Heard and W. B. Gray, all well known and prominent orange growers, who are personally interested in the success of the industry. These men all agreed to make the trip at their own expense, which they will do some time in April. They are expected to make a report at another called meeting about June 1, upon their return from the West.—Florida Produce News.

Time tells the tale!

Measure the cost of ready roofing by what it will do all the way through.

Genasco Ready Roofing

costs a little more in the beginning than ordinary roofing because it is made of genuine Trinidad Lake asphalt; but that gives it life to resist sun, air, heat, cold, rain, and fire. You are sure Genasco will last—you know what it's made of; and you know it is cheapest in the end.

"APPLE DRIVING OUT THE ORANGE."

The Spokesman Review, published at Spokane, Wash., in the center of the great apple producing country, has "discovered" that the apple is becoming a formidable competitor in the markets of the United States with the orange. We feel the Review has endeavored to reverse the situation as we look at it. The apple has been the standby of fruit lovers of this country for so many years that it need not be concerned over the present remarkable increase in consumption of oranges. At least not to the extent of using a scare-head stating that the apple will drive out the orange. There is abundant room for greater consumption of fruits of all kinds. Let the apple growers take the cue from orange growers and induce more liberal use of all fruit consumption. The raisin men have become wise. Instead of making comparisons and showing that the apple is still preferred over the orange we think nothing whatever is gained for the apple grower. Let our apple growing friends take up this campaign of advertising and see if the increased consumption will not be so eminently agreeable that there will be no occasion for referring to the success of any other fruit. Speaking of the advertising campaign, the Review says:

"There advertisements, which appear without name or authority, are set in bold display type, double column measure, and this is the text: "Oranges are cheaper than apples and more healthful. Order a peck from your dealer."

Probably it is true that oranges are cheaper in the eastern markets than the high-grade apples of the Pacific northwest, but it is nonsense for the orange growers to assert that the product is more healthful than the apple.

The orange is an insipid fruit, of which most people soon weary, and its use is limited, while the apple lends itself to an almost infinite variety of cuisine. It may be served raw as oranges are served; it may be cooked into sauce or baked, roasted or fried, or made into pies and tarts; it can be evaporated and transported to the most remote mining and lumber camps, and its by-products of jelly, cider and apple wine are commodities of widest use.

The orange is outclassed by the apple at every point, and commercial apple-growing in the Pacific northwest is in every way a safer investment than an orange grove in California."

We do not think a single orange grower in California will take exceptions to all the good things the Review says about the apple. They will go further and speak in greater praise of this wonderful fruit which has been a favorite with the human race for many generations. But we will not agree and do not think that the Review honestly believes that the orange is an insipid fruit of which most people soon weary. Practically every use which is made of the apple is also possible with the orange. It makes the finest of sauce; a finer pie can not be imagined; a cake more delicious than one in which the "filling" is flavored with orange can not be baked. Jellies, marmalades, ciders and wines may be made from it.

Long live the "Apple of Gold" and may it always be granted a place beside its brother of the cooler latitude.

SCHEDULE OF AGRICULTURAL TRAIN.

As announced last week, the Agricultural Train is about ready for its fifth trip. The date, however, has been set over, which was a most wise move. The train will now start on next Monday morning at 10:30 o'clock from Los Angeles. The first stop will be at Compton from 11 a. m. to 12:30 p. m. Following that their meetings are as follows: Downey, 1:30 to 2:30; Whittier, 3 to 5:30, with evening meeting.

Tuesday, April 20th. Norwalk, 8 to 10 a.m.; Buena Park, 10:30 to 12:30; Anaheim, 1 to 3 p.m.; Santa Ana, 3:30 to 5:30 p.m., also evening meeting.

Wednesday, April 21. Smeltzer, 8 to 10 a.m.; Los Alamitos, 10:30 to 12:30; San Fernando, 3:30 to 5:30 p.m., with evening meeting.

Thursday, April 22nd. Burbank, 8 to 9 a.m.; Lankershim, 9:30 to 11:30; Simi, 1 to 2 p.m.; Moorepark, 2:15 to 5:15 p.m.; Somis, 3:30 to 4:30; Camarillo, 4:45 to 5:45; Oxnard, evening meeting.

Friday, April 23d. Oxnard, 8:30 to 10 a.m.; Montalvo, 10:15 to 11:15; Saticoy, 1 to 3 p.m.; Santa Paula, 3:30 to 5:30 p.m.; also evening meeting.

Saturday, April 24th. Fillmore, 8 to 10 a.m.; Piru, 10:30 to 12:30 ; Ventura, 3:30 to 5:30, also evening meeting.

Monday ,April 26. Nordhoff, 8:30 to 10 a.m.; Carpinteria, 1 to 2 p.m.; Santa Barbara, 3 to 5:30 p.m., also evening meeting.

This train is operated at great expense by the Southern Pacific Company which carries the entire financial end . Of course speakers and demonstrators are drawn from the force of the State University and from the State Horticultural Commission. Each branch is well represented on the train and the three cars of exhibits make this well worth encouragement by a large attendance on the part of the farmers wherever the train may stop. It was disappointing on the former trip to see the meager attendance in some sections. At that time the notice given was very short. For this trip the dates have been deferred so as to give more extended notice. It is worthy of still greater publicity than even now will be possible, but we trust every farmer who may read this will make an effort to get the information which is freely given by this demonstration train force.

PRUNE GROWERS ORGANIZE.

Co-operation seems to be in the air. Even Florida is sending a delegation of her citrus growers to study methods of marketing oranges in California. The raisin men have been trying hard to get into line for organization but have much work yet before them before that is accomplished. Walnut men are making the effort. The latest, however, to make a determined stand for thorough co-operation are the Santa Clara valley prune growers. Sometime ago a committee of fifty was appointed to devise plans and report to the entire body of fruit growers. That body met in San Jose and a committee of fifty placed in the hands of each farmer as he entered the room a slip stating the object of organization as follows:

1. Correction of wrong methods of curing and packing.
2. Stability and uniformity of price.
3. Fixing of a reasonable price to be charged by the Eastern retailer to the consumer.
4. Judicious advertising of Santa Clara Valley prunes; printing and distributing books containing recipes for preparing prunes in an attractive manner and in other ways working to increase the consumption of prunes.

Also another slip showing the recommendations of the committee to obtain these objects, as follows:

1. Growers to organize legal district associations under the new State law which was especially prepared for this purpose by the orange and walnut growers' association.
2. Organization of Central Growers' Corporation.

(a) All District Associations to become members of the Central Corporation.

(b) Growers not members of District Association to be allowed to become members of Central Corporation and to have equitable representation on Managing Board.

Prunes to be held either in District Associations or growers' hands, as growers elect, until sold and paid for.

The prune growers must organize and control their own organization.

In addition to these two condensed reports the committee made a more extended report outlining the form of organization, advertising campaign, system of inspection, cooling of fruit, prevention of price cutting, and in general a co-operative pulling together which will put the prune industry on a better basis than it is at present.

The spirit of harmony which prevailed in the meeting was such that those interested in the fruit industry feel much more hopeful than for sometime. We believe the organization will be perfected and trust will lead to entire success.

EAT CALIFORNIA RAISINS.

The above, which is the slogan of the raisin publicity committee now working in Fresno, has been taken up with such energy by people all over California, and to a certain extent already beginning to receive attention in the East, that the raisin committee at Fresno finds it is floored under rush of business. We wrote some time ago asking this committee for information and for the primer containing the recipes and facts regarding raisins. The committee has been so deep under the mass of business that we have not yet had reply. We trust this will be here in time for next week's paper which will still give a week for our readers to lay in a supply of raisins and know how to properly eat them. Therefore we promise in next week's issue a fund of raisin information which will help, we hope, in making popular the raisin with all people who eat.

A reasonably small quantity of apples is held in this country at this time as compared with other years. It is thought this will not total to exceed 700,000 barrels or about one-third of that of last year at this date. New York has the largest holding; Illinois has the second largest while California comes in third.

Reports from the Eastern peach growing sections go to show that the peach crop will be short of normal this year. The Northwest, especially Washington and Oregon, report about 95 per cent of the normal crop.

Agricultural Notes of the Pacific Coast

Northern California

Yolo county apricot growers report shortage of the coming crop.

Woodland farmers are greatly increasing the acreage of alfalfa.

Yuba county reports prunes blooming full with cherries promising good crop.

Anderson, Shasta county, is getting ready for the rose festival to be held on May 1st.

The two creameries at Meridian are paying out to farmers about $500.00 per day.

It is thought that pear blight is largely under control in the Capay valley, Yolo county.

A Contra Costa county farmer has perfected a solution which he believes will exterminate thrips.

The Gridley creamery has recently established an ice-making plant which is the first in that section.

Several hydraulic miners will be arrested and given trial in Sutter county for violation of the anti-debris law.

The state veterinarian will appoint sixty deputies who will have general oversight of the stock interests of the state.

A Petaluma poultryman suggests that a California hen would be a more fitting addition to the State seal than the bear.

A plan is being developed for the draining of southern Butte county which it is thought will reclaim much valuable land.

Orchardists near Gridley, Butte county, are contemplating the purchase of a large tract of land for almond culture.

A Eureka creamery man has just returned from Japan and reports possibilities in extension of butter market with the Japanese.

A Los Angeles firm which packed asparagus in Sacramento under Los Angeles brand has withdrawn from that section for this season.

The sale of the last prunes in Healdsburg was consumated recently. The output of that section for the year was about forty car-loads.

A project is on foot to form a fig growers' association amongst the fig producers of Winters, Yolo county. The district produces about 250 tons.

A Ukiah hop grower has contracted his hops for three years at 9, 11 and 12 cents per pound. Some others in the same section have contracts on the basis of 10, 11 and 11.

Oroville is planning for the planting of greater numbers of eucalyptus trees on land which was supposed to be ruined by the dredger miner. Thirty acres of this land will be planted and used as a park.

The Petaluma Incubator Company is contemplating the erection of a large new factory, but owing to an effort on the part of the city council to secure the land for street purposes, it is possible that they will remove to some other town.

Representatives of the California Fruit Exchange recently returned from a trip through the fruit marketing sections of the East and report financial conditions greatly improved with probability of getting returns from fresh fruit shipments this year.

Central California

Watsonville will make an exhibit of apples at London during the coming summer.

The creamery at Turlock, Stanislaus county, has been obliged to double its capacity.

During last season one firm in New York handled over 200 cars of Pajaro valley apples.

Porterville is making an effort for levees which will protect that section against stormwaters.

The San Jose Grange was recently given an address by Weather Observer Connell on the subject of frosts.

Kings county people are entering with enthusiasm into the "Raisin Day" preparation and promise to keep up their end.

The Coast Canner's Association reports sales of California canned fruits much more satisfactory than for some months.

The orange section of eastern Tulare county anticipates the early building of the Santa Fe Railway through their section.

A Dinuba farmer has found peas planted between orange trees to be exceptionally profitable. The peas were planted in November.

Farmers generally over the San Joaquin are pleased with work accomplished by the farmers union in disposing of fruit up to this time.

The women's improvement club of Madera has taken a lead in tree planting about that section and has been the prime mover in improving several roadways.

"Raisin Day" meetings are being held all over the San Joaquin Valley. The central committee at Fresno has issued one million leaflets with raisin information.

The Porterville Enterprise makes an appeal for home grown-vegetables and thinks there should be greater development of the apple industry in the eastern side of Tulare county.

The investigations of G. Harold Powell and his corps of assistants in Tulare county developed much the same condition as prevailed formerly in the orange sections of Southern California.

The State Board of Health is fitting a car at Palo Alto, the purpose of which will be to tour the country districts of the state showing wherein more healthful conditions may be established on farms.

The final step of the old California Raisin Growers Association was taken recently when the Judge of the Superior Court ordered the distribution of 25 per cent of claims due several hundred raisin growers.

Reports from Bishop, Inyo county indicate great damage to pine trees on the eastern slope of the Sierra especially in the Inyo national forest have been greatly damaged by girdling of the trees by porcupines.

One of the largest meetings of producers ever held in Santa Clara county was the last meeting of the prune growers which showed a determination to form an organization or "Central Grower's Corporation," through which prunes may be marketed at more satisfactory prices than heretofore.

Southern California

Colton hopes to be the location of the raisin seeding plant.

The Tustin Packing Company is busy finishing the packing of navels.

Lompoc farmers will form a stock company for marketing products for members.

Santa Ana health board is enforcing the ordinance against unclean dairymen.

Nurserymen report this a very satisfactory year, especially in the sale of walnut trees.

County Bee Inspector Pleasants of Orange county, inspected thirteen apiaries last month.

The building of the Laguna dam has shut off the navigation of the Colorado river above that point.

It is now reported that artesian wells have been found in the northwestern section of the Imperial Valley.

Santa Ana has new tree-planting law by which roadside trees are entirely under the control of a tree warden.

Farmers at Perris, east of Riverside, are hoping for the early establishment of a million dollar sugar factory.

Citrus sections are disappointed in that the recent state legislature failed to make proper provision for more extended citrus experiment station work.

Some orange packers have found advantage in shipping oranges in half boxes and this year's shipments in the small box has been greater than heretofore.

The Imperial Valley claims the shipments of agricultural products from that section aggregate a carload per day for each mile of railway in the valley.

Ranger Graham in charge of the Los Parietos tree planting station in the Santa Barbara reserve has planted during the past season 65,000 vines and 75,000 eucalyptus trees.

The investigations of the pomologist of the Department of Agriculture under the direction of G. Harold Powell is proving most profitable to the lemon growers of San Diego county.

One of the largest orange packing houses in Redlands was seriously damaged recently by the backing of four loaded cars against the walls of the house and in the smash-up over 1000 boxes were destroyed.

The canteloupe output of Imperial Valley will be materially reduced this year and will be later than any prior year. Figures show that there are about 5,000 acres of which only about fifty per cent will prove to be a good crop.

Forest Supervisor Charlton reports that the fire trails in the reserve in San Bernardino mountains are now in excellent condition and that over 50,000 young trees have been planted between Lytle Creek and Banning canyon.

Bean growers in Ventura county charge that some buyers have been endeavoring to bear the price of beans claiming that they would yet go down to two cents a pound. Fortunately the growers are not concerned regarding this report.

The Coast

Tillaamook county, Oregon, produced three million pounds of cheese last year.

Farmington, Wash., has had extensive planting of orchards during this spring.

It is estimated that 6000 cars of fruit will be shipped out of the Grande Valley, Colorado, this year.

Alaska will exhibit a pile of virgin gold at the Alaska-Yukon Exposition which is claimed to be worth five million dollars.

Live and dressed poultry has been exceedingly scarce in Seattle, Wash., markets and appeal has been made for heavier shipments.

Horse shows held at Walla Walla, Wash., and Mt. Angel, Oregon, recently brought out a remarkably fine showing of high bred stock.

The Polk county Mohair Association located at Dallas, Oregon, recently held its annual sale, prices ranging from 21 to 23½ cents.

Celery growers from Kalamazoo, Mich., have recently made large purchases of land at St. Maries, Idaho, and will plant extensively to celery.

Enemies of the State Agricultural College of Oregon are threatening to hold up the appropriation for that institution which they declare is too liberal.

The American Shorthorn Breeders' Association are offering $750 in cash for breeding shorthorns at the Oregon State fair to be held at Salem this fall.

The lake to be formed by the construction of the Roosevelt dam will be used by the Department of Agriculture as breeding grounds for native birds.

The dedication of the Laguna dam a few miles above the city of Yuma was consumated in the presence of a large gathering of people from California and Arizona.

Denver and Rio Grande Railroad combined with the State Agricultural college of Colorado are giving the farmers a fund of information from a special potato train.

It is estimated that twenty-five thousand people visited the poultry and horticultural demonstration train on the Southern Pacific in Western Oregon within four days.

A corporation with $100,000 capital will make extensive irrigation improvements during the coming year which will bring several thousand acres under cultivation at La Grande, Oregon.

The largest shipment of beef cattle ever made from Tempe, Arizona, was made last week when thirty cars were sold by one range owner. Prices range from $4.25 to $4.75 per hundred.

Farmers near Ontario, Oregon, have been experimenting extensively in growing sugar beet seed. Some excellent results have been made and it is hoped will develop into a large industry.

Peach orchards in several sections in the state of Washington were severely injured by the exceedingly cold weather of January. Some orchardists are saving their trees by pruning back heavily but no crop is expected this year.

The Ornamental Garden

THE IRIS.

THIS flower was named from Iris, a radiant Goddess arrayed in garments of surpassing splendor, a personification of the rainbow which is a concentration of all tints, rays and coloring of beauty. It is one of the four great perennials: peony, iris, phlox, and columbine. There is a large family of these exquisite flowers. They range in time of blooming from early spring until the middle of July.

Here at our experiment station in York we keep 125 kinds and it is wonderful how a patch of somber earth, in a short time, can be glorified with such indescribable splendor. It is as if the rainbow were taken to pieces and remade into forms of loveliness, the parent bow never saw before. Their hardiness, rapidity of increase, marvelous tracery and interweavings of harmonious tints and colorings should make them favorites in every home.

They are of three sorts: The bulbous; those with rhizomes or spreading tubers; and the tufted rooted ones. The English and Spanish sorts have bulbs like tulips. They are rather tender and for the most part insignificant, so we have discarded them. The German sorts are very numerous, hardy and beautiful; they are called the garden orchids. They increase by rhizomes, which spread out like potatoes. We sometimes get 30 from one in two years. The tufted ones are the Siberian and Japanese sorts.

Among the leading sorts, without going into the high-priced ones, the following are worthy of mention: Florentina Alba; they have large, white, early and fragrant flowers. They produce the oris root of commerce, so much prized in the manufacture of delicate toilet articles. Another is Sans Souci. The flowers of this variety are vivid yellow, with drooping petals delicately veined with chocolate. Queen of May has a soft, rosy, lilac color of delicate beauty.

Parensis is a robust plant with large deep velvety blue flowers. Innocenze is a fine tissue-paper white, with large, very early flowers. Madame Chereau is of the most exquisite loveliness. Its petals are nearly white, fringed with lavender, exceedingly delicate and almost ethereal in loveliness.

In the Siberian family the varieties are all very hardy and multiply rapidly. Siberian Blue has one of the most intense, clear, and vivid blue flowers in existence; it is much prized by florists, easy to ship and its color blends harmoniously with those of other flowers. White Siberian is a lovely flower; it is much prized for cut flowers. Snow Queen, while still rare, is a flower that is in great demand, there not being enough to go around.

The Japanese irises are very large, often eight to ten inches across, with almost every conceivable blending and inter-weaving of color. In the West they must have wet feet at blooming time, and also shelter from the hot south wind.

All these flowers are cheap. Most dealers can send you an assortment by mail, prepaid, for $2 per dozen, and from these, in five years, you will have hundreds of charming flowers in great masses of loveliness. After getting acquainted with them, you will want some of the higher priced ones. Plant German and Siberian on good, rich, well drained ground. Put the bud about two inches below the surface. The Japanese variety will do best on moister ground, but must not stand in water in winter.—Farmer's Tribune.

PLANTING THE LAWN.

The planting of the lawn is of as much importance as any of the other garden planting. In fact, the lawn is really the most important gardening around the farm house, especially from the point of view of beauty. It makes the grounds look clean, neat and restful. It improves the appearance of the dwelling, making it harmonize with its natural surroundings and makes those surroundings sanitary and expansive in appearance.

There are two ways of planting the lawn. One is by seeding and the other is by sodding. Seeding is the easier method and slower in results, while sodding requires more labor, but gives quicker and more substantial results.

Lawn seeding, as well as almost all other seeding, is best done early in the spring when the soil is moist and young plants will grow without suffering for water. However, grass seed may be successfully sown at any season under proper soil and moisture conditions. Before seeding, the surface of the soil for the lawn should be cultivated, fertilized and smoothed. The lawn once planted is to remain permanently, and the more thoroughly the soil is prepared and fertilized the better will be the results in a permanent stand of grass. The finished lawn is to be smooth and even, and if this work is done at the first seeding very little lawn mending will need to be done afterwards.—Journal of Agriculture.

ASTERS.

Asters are becoming more popular every year and it will not be long before they equal pansies or sweet peas as the favorite flower. There has been a great advancement made in asters during the last five years in size, color and perfection of flowers.

People unacquainted with these advances can scarcely have any conception of their double flowers, especially when grown according to the latest methods of culture. For early blooming, start the seed about the middle of March. When the second leaves appear, transplant so as to stand two inches apart each way. When the soil has become quite warm they may be set out into the garden about 15 inches apart each way. For late flowering sow the seed in a finely prepared seed bed about the end of April. When well started set out where they are to bloom. Transplanting asters is highly recommended as it causes them to form stockier plants and produce larger and finer blossoms. If very large flowers are desired, allow each plant to bear not over eight stems or flower shoots; the others should be pinched off every few days. Asters require very rich soil in order to attain their greatest perfection.—Farmer's Tribune.

This season's planting of eucalyptus trees near Tulare will aggregate over 3000 acres.

Small Fruits and Vegetables

STERILIZING THE SEED BED FOR TOMATOES.

LAST fall in the neighborhood of the Colorado Agricultural College, writes Prof. Leslie F. Paull, there was a considerable scarcity of tomatoes. Growers complained that there was something the matter with their seed, or with their plants which failed to bear. Generally they attributed it to the season. However, while this complaint was being made, one grower was picking from one to two bushels daily from a small garden patch. This man knew the secret.

This is the time of year to provide for a crop of tomatoes. Upon heavy soils, and sometimes upon light ones, the Fusarium blight prevents the development of the fruit, or the fruit is of small size, poor in quality, and sometimes even shrivelled.

What is the Fusarium blight? It is caused by a fungus, a mold something like that which comes upon bread, old cheese, etc. It is found in the soil and apparently acts a little like the smut-fungus of onions. It is known that if onions be planted in soil known to be free from this fungus, and are then transplanted to a soil where the disease has previously ravaged the crop, the young plants do not take it; whereas seed planted there results in smutty onions. Investigation has shown that the fungus enters the tip of the seedling, as it emerges from the seed; so, if the seed-bed has no smut in it, the onion escapes. How the Fusarium blight enters the tomato plant is not known. But it is known that it enters it during its early stages. Then the fungus lives on for a long time, showing no evidences of its existence in the tomato plant. However, during this time it is sending a web of threads through the tissues of the plant, and by the time the fruit begins to form, there is such a mass of fungus threads in the vessels that the fruit can only form with difficulty, if at all.

No amount of treatment at that time can do any good. The fungus is established within the plant. However, if the soil in which the seeds are planted is sterilized, the disease does not get a footing, and the plants will develop their fruit naturally and freely. The best method of sterilizing the soil for the seed bed is to fill a barrel with the prepared soil and take it to the exhaust pipe of some steam boiler. The pipe, or an attachment from it, should be passed to the very bottom of the barrel, and the steam allowed to penetrate for two or more hours, gunny sacks being packed about the top to hold in the steam.

While it is believed that the disease is contracted at germination, it is desirable to take certain other precautions. No other soil should be allowed to get into the sterilized bed or boxes. If the seedlings are pricked off young, they should be placed again in sterilized soil. Water that has been boiled and cooled should be used for watering during these early stages. No further precautions are necessary when it comes time to set these in the field.

For the home garden the soil may be sterilized by being spread out in shallow pans and baked in the oven. This is not so desirable as steam, since it does not leave the soil in such good condition.

Egg plants are also subject to Fusarium blight, and possibly also peppers. Cabbage, cauliflowers, broccoli, brussels sprouts, etc., which so easily "damp off" in the seedling stage, succeed better by being planted in sterile soil.

HORSE MANURE.

Good horse manure, delivered at the consumers' depot for $1.25 per ton, would furnish the essential fertilizing constituents at a very low cost. In many market-garden districts, farmers regard horse manure as a good purchase at $2 a ton. Naturally, the value of the manure is not based entirely on its content of fertilizing constituents—the vegetable matter of the manure being in many cases of quite as much additional service in the improvement of the physical character of the soil. It must be remembered, too, that manure varies widely in its composition, due both to the amount of litter present and method of caring for it. If the litter has been used economically, and the manure has not been subjected to heavy rains, it is much more valuable than if these precautions are not observed.

The Apricot Output

CONTINUING the reports made last week the following letters have been received:

Geo. Robertson, Fresno.

I report that I am unable to give you a definite reply so early in the season regarding the probable output of apricots in Fresno county. I have made enquiries however and find that the general opinion is that the crop will most likely be below the average. All now depends on the weather.

Thos. W. Spier, Ventura.

Regarding apricots; will say that it is too early by at least two weeks to give you any reliable information regarding the crop. I was in an orchard today and found very few cots and since receiving your letter I have called several growers up over the phone and they all say we cannot yet tell.

As soon as I can yet posted on crop conditions I will answer fully.

A. B. Gardner, California Fruit Canners Association, Fresno.

I figure we will have about 500 tons dried apricots in Fresno county this season. Of course this subject to having no frost to destroy any, this is about 50 per cent of a crop. As regards the output from Fresno that depends on the demand. We ship in here from outside points as required.

L. E. McCann of Golden State Canning Co., Ontario.

Replying to your favor of the 2nd, there will be fully 90 per cent of a full crop of apricots in the Ontario district, probably from 1,500 to 2,000 tons.

O. S. Hofmann, San Jacinto.

The output of apricots for San Jacinto valley is exceedingly promising and should say would be a full crop. Some new orchards coming into bearing. Have not been over the entire valley lately but everything promises well. Honey too.

The Gem of the Meadow

Prize Alfalfa Seed

Alfalfa is the king of all forage crops. No crops can be grown and harvested with less expense or greater profit.

With good moist soil and our Prize Alfalfa Seed six crops can be secured in one season, and that's hard to beat.

We have only a few cars left of this Prize Seed. It comes from the best, most prolific hay meadows, from the cleanest fields in the choicest farming section of Utah.

The market is steadily advancing—write at once for price and free samples of this fine seed. Special prices in large quantities.

Handsomely illustrated seed catalog just issued. Sent free on request.

Irrigation and Forestry

AMOUNT OF WATER REQUIRED.

The amount of water required in the production of various farm crops has been the subject of an investigation on the Twin Falls tract, in southeastern Idaho. Alec McPherson, director of the private experiment station in that section, says that his object was to find out how much water is really needed to produce good crops on a 40-acre farm, consisting of about the varieties of crops that should be raised on the Twin Falls tract.

On cultivated or grain crops less water was applied than on the alfalfa or pasture. Mr. McPherson adds:

A better appreciation of the important part that water has in crop production may be had from the following figures, which show its relation to the production of given quantities of hay, grain, vegetables, sugar beets or other crops:

The amount of water in pounds, tons or acre feet used in producing a ton or 100 pounds of the different crops:

Alfalfa.

Four hundred and thirty two and seventy-eight hundredths tons of water required by the soil per ton of alfalfa hay, or equal to 3.82 inches in depth per acre.

Potatoes.

Four thousand six hundred and twenty-eight pounds of water received by the soil per 100 pounds of potatoes or equal to .205 inches in depth per acre.

Carrots.

Seventy-seven and seventeen-hundredths tons of water received by the soil per ton of carrots, or equal to .68 inches in depth per acre.

Beets.

Ninety and seven-tenths tons of water received by the soil per ton of beets, or equal to .80 inches in depth per acre.

Beans.

Fifteen thousand two hundred and ninety pounds of water received by the soil per ton of beans, or equal to .72 inches in depth per acre.

White Dent Corn.

Seventeen thousand six hundred and eighty pounds of water received by the soil per 100 pounds White Dent corn, or equal to .8 inches in depth per acre.

Flint Corn

Nine thousand two hundred and ninety pounds of water received by the soil per 100 pounds of Flint corn, or equal to .41 inches in depth per acre.

In computing these amounts the water that run off as waste was not figured in, only the amount received by the soil by irrigation and rainfall was taken into consideration.—Inland Empire.

DISTRIBUTION OF WATER IN SOIL.

(Continued from Page 435.)

water had penetrated to a depth of only a foot or less after a three days' flow in the furrows. Every orchardist should know his land thoroughly, with regard to its richness in elements of fertility, and especially with reference to its physical characteristics to depths of six or more feet, its relation to percolation, and its retention of irrigation water.

Percolation.

The percolation of water into the soil is influenced or controlled by a number of conditions:

By the air of the soil, which must give way before the advancing water—for otherwise it acts as a cushion and effectually prevents percolation of the water downward. This might happen in irrigation by flooding or by heavy rainfall, but in the furrow system the air escapes by lateral movement until the surface of the soil is saturated with seepage water from the furrows.

By coarse soil texture in which the water would meet with but little resistance on the part of the soil and gravity would cause it to sink rapidly downward.

By impervious or compact stratum, which would quickly arrest the downward movement of the water and cause its accumulation and probable loss by run-off.

By the root system of trees, which seems to facilitate percolation, but only along the lines of their extension and not through the soil.

By the kind of furrow made, whether wide or narrow, deep or shallow.

By cracks or crevices, holes or sand pockets, which of course afford a quick passage of the water deeply into the soil, which may mean a loss if the holes reach a bed of coarse sand or gravel.

Percolation is influenced by the time that water is allowed to remain in the furrow. The water should be made to reach the end of the furrow as soon as possible, and then the flow so regulated that the whole line may receive practically the same amount and to depths of eight or ten feet. If the movement is slow and the soil conditions favorable to percolation, then in the soil near the head ditch there is danger of loss by the percolation of the water far beyond the reach of the root systems.

FAILURE THAT MADE FOR GREATNESS.

A striking illustration of his sympathy for the people of the Confederate states was his attempt, earnest and ineffectual, in the last days of hostilities, two months before his death, to convert his own cabinet to his generous and long-cherished scheme of compensated emancipation. That he failed pathetically to carry through this plan, upon which his heart was set, illustrates also the fact that uninterrupted success is not necessary to the fame of the great figures of history.

Lincoln's failure to win support for this humane policy deeply grieved him, but the misadventure is not held against him in the estimate of his greatness. On the contrary, the fact that he made the attempt counts in his favor, and to-day especially endears him to multitudes of his countrymen, and is one of the very bonds that hold the country together.—From "Lincoln the Leader" in the February Century.

The Walnut Grower's Association is getting affairs in shape for next fall's crop, but as yet some associations have not manifested a disposition to come in.

Capitalists at Boise, Idaho, have purchased a large tract of land and will plant extensive apple orchards.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. Minna E. Sherman

QUESTIONS.

WHEN the Chinamen on the ranch are given new work they at once ask, "What for." In the plowing, sowing and cultivating if we say to each operation, "What for?" The chances are that in a few years the farming we do will be radically different from that we are practising today. The idea prevails in the new district of Imperial county that constant irrigation every month of the year is needed. This may be so, yet if it is, the land and vines must differ from those in other parts of the state. The dust mulch has been found to be much better than the constant watering. This constant watering was discussed during the recent demonstration train trip, and every time one or two men had already found it unnecessary. Man after man said they had no use for sulphur for they never saw mildew on the grape vines, yet several times young vine shoots covered with mildew were brought into the car. I well remember the first mildew that was sufficiently bad to be recognized as a menace in Fresno county. No doubt we had it in a small way long before the season of peculiar weather that gave it a chance to develop rapidly.

Questions.

Every day there should arise in our minds as we go about the fields and herds, questions if we are awake. The way to succeed is to ask questions whenever we reach a point that we do not understand. In farming the fact comes before the theory; then by comparing notes with others, we find our observation of facts have been coroborated by other observers. One remark that I think every demonstrator on the last trip heard daily was this, "O! I wanted to ask that question, but was ashamed to show my ignorance." Could anything be more foolish! As if there is anything to do with ignorance except to get rid of it as quickly as possible. Ask the first person that should know about the matter at the first chance. This is a good way to secure wisdom for verily there is little to be found in books but wearyness of the flesh. People are full of the stored wisdom of experience and in a few words often the result of a life time is told.

Cows That Pay.

The pleasures of being an editor of a Live Stock Department are many, chief however, are the many delightful letters that come to me from other women. I have one now full of practical questions that we will try to answer in this article. This is from a woman on a dairy farm, and is full of pertinent thought. The cost of keeping a cow on alfalfa land should be considered at the price the land is worth if other stock were pastured on it; this is $2.00 a head per month. The hay used should be counted at the prices it would sell for at the time of the second cutting.

During the eight months of this year each cow received feed at the barn. Two hundred and forty days, one ton and a half of alfalfa hay at $8.00 a ton is $12.00. Four and a half tons of sliage costing $2.50 a ton, making $11.25. One ton of mixed grain, barley, bran, Caprico meal and oil cake costing $28.00. Four months pasture at $2.00 a month makes $8.00. This makes a cost this season of $59.25 for feed.

This year is the highest of any in cost I have on the record. The usual cost being about $48.00 to $50.00 dollars a year. Had there been enough corn silage to have lasted the season the ton of grain feed would have been saved and the cows given as good returns as with the grain. The milkman even at the high prices prevailing is not getting rich this year. The point of this is that we must have better cows. This can be cheaply done by using a full blooded sire at the top of the string. The registered stock pays by the prices received for the calves alone. Two calves sold pay for the dam, and then after that each one is so much gain.

Testing.

The herd of common cows are readily made profitable by taking out the poor ones. The Babcock test is simple enough for a child to run and understand the working. These machines come from the small ones selling as low as $3.75 having two bottles, up to the large steam machines. Now when a cow gives four per cent milk that means that when the milk is tested by the machine that it shows that in a hundred pounds of this milk there would be four pounds of butter fat. Say the cow gives four per cent milk and 28 pounds of it a day. We multiply the pounds, 28, by the fat, four per cent. Twenty-eight multiplied by .04 gives us 1.12 pounds of butter fat as a daily yield. Now butter fat is a pure product while commercial butter contains a little casien, salt, water and some ash. There is 86 per cent butter fat, to as low as 80 per cent in commercial butter. In other words about one-sixth of commercial butter is water, salt, casein and other ingredients. Therefore dividing the 1.12 by six we have .188. Add this to the 1.12, we find the cow to be yielding 1.31 pounds of butter daily.

As one day's test may not indicate a cows quality very well, we take samples from each milking for three days, weighing the milk at each milking. These composite samples are kept sweet by using corrosive sublimate tablets in the jar. Then by multiplying the amount of butter shown by the test by ten the amount of thirty days is shown. Tests made the sixth week after calving, the fifth and seventh months and used as a basis of calculating will make a fair test of a cow's performance as a butter animal.

Heifers.

Before the heifers come in, feed them liberally and push them into flush condition. It is a mistake to have them come in weak and poor in flesh. If they come anywhere near paying their expenses give them a second year's trial. If these heifers are from common cows with a common sire they may not be worth a second trial and then should be turned off to the butcher. The sire should

Keen Sportsmen Never Waste Ammunition on "DEAD DUCKS"

The DeLaval Separator Company in their advertisements beg to be excused for devoting so much space to the United States Separator, which they consider a **"dead duck competitively."** This is a sweeping admission on their part that the United States Separator is not dead but is the most vigorous duck in the whole flock.

Keen sportsmen never waste ammunition on "dead ducks."

The facts showing who was the original Inventor of the first practical continuous flow Centrifugal Cream Separator, as disclosed by the records in the Patent Office at Washington, make it plain that Dr. DeLaval was not the original inventor.

These records show that DeLavel, beaten in his claim of priority by other applicants, bought up the Houston & Thomson application (which ante-dated his own), in which he filed a substitute application and added the identical claims that he was beaten on, in the interference with the other applicants.

The Patent Office then allowed these claims to Houston & Thomson and the Patent went to issue.

The United States Circuit Court of Appeals afterwards decided in effect that Houston & Thomson were not entitled to the broad claims, and Dr. DeLaval "was not in it."

De Laval bought the Houston & Thomson application to deprive the rightful inventors of their invention and then DeLaval got beaten at his own game in the Courts.

The DeLaval in their advertisements accuse the United States of utilizing in their Separator an invention which they purchased.

This is not true, as an examination of the DeLaval patent referred to and the United States Separator patents will readily disclose the falsity of the DeLaval claim. This is another "word claim" of theirs.

The 1909 Model United States Separator is covered by patents (720,154; 726,438; 732,750; 806,346; and 859,185) owned by the U. S. and which cover its scientific features which make the United States Separator so much superior to the DeLaval and every other Separator on the market. These are but a few of the nearly 40 patents owned by the United States.

Another thing, they accuse the United States of being responsible for the nullification by the Courts of a patent purchased by the DeLaval in their efforts to "squelch" the United States Separator, which patent they admit they never used but which they bought and paid $20,000.00 for, according to the Court records, in the hope that it would "squelch" the United States Separator that was beating them so vigorously in the market.

It is true the Court decided that they had spent their $20,000.00 in vain. The United States Separator accomplished better results with a bowl of half the diameter and with less than one third as many parts as the DeLaval had.

The DeLaval whine because the United States holds the World's record in a test with the DeLaval of 50 consecutive runs on 10 different breeds of cows.

If this record is so ancient and so non-progressive, what is the reason they have not been able to beat it in all these eight years they have been attempting to do so. Let them show a more progressive record in this Country or any other, if they can do so.

The U. S. is still eight years ahead of the DeLaval.

The DeLaval Company claim that the LaGrange Creamery is a little Creamery and admit that it is near Poughkeepsie.

If it is so small and of so little consequence, why did they spend so much money at the Dutchess County Fair, Poughkeepsie, N. Y., in the Fall of 1899 and get the President of that Fair to offer a money premium for a test at the Fair between the DeLaval and the United States Separators. **Why if it was so inconsequential did they stop their Factory and turn out all their men without loss of pay to "whoop it up" on the day of this great test?**

It was apparent to the public that the DeLavel Co. felt satisfied they had things fixed to win the contest, but the test of the cream showed that the United States had secured more butter fat from the quantity of milk than had the DeLaval.

Again if it is so inconsequential why did they have eight of their best canvassers immediately thereafter in that one locality to solicit orders and to prevent, if possible, the farmers from buying the United States Separator, yet when the canvass was closed there were three times as many farmers who had taken the United States, as there were who had taken the DeLaval.

The DeLaval accuse us of changing from year to year the date of President Hoyt's letter. This is a falsehood. We do not find it necessary to falsify records and thus deceive the people. **The facts remain true as Mr. Hoyt states them, that there are three United States Separators to every one of the DeLaval.**

The DeLaval Company advertise that they make more trade allowances for old United States Separators than for any other make of Separator.

We guess that is true, for there are more United States Separators in use and we have been repeatedly informed by users of United States Separators that the DeLaval agents have bored them to death to exchange and before giving up their persistence, have offered to give a new DeLaval in even exchange for an old United States.

Quite a number of former traveling salesmen of the DeLaval Company have informed us that they have been instructed from Headquarters to give a new DeLaval Separator for an old United States Separator, if they could not make any better trade and that their instructions have been from the DeLaval Headquarters, that the repairs on the DeLaval in a short time would make a good handsome profit on this kind of an exchange.

The DeLaval Company refer to their farm sizes of Separators as the "Baby" type.

The United States Spanked the "Baby" so hard in days gone by that they seemed for a while to try to tell the truth and not make such extravagant claims, but they have got into their old tricks again, making extravagant, false statements and "word claims."

The above we think is sufficient for this time; to be continued later on, but in the meantime send for Catalogue No. 20.

not run with the stock if it is being culled for the butcher as it is hardly fair to sell him stock that has been bred. Where a pure bred sire is in use the heifers will come out much better. Then if they fail to make good sell them off quickly for it is too expensive to keep them in the dairy string.

Alfalfa hay if it is made before it has come into full bloom will bring in handsome return as a feed. The old saying is true, "Hay as fine as silk, is quick to make milk." I know of nine half Holstein cows that gave during the month of January on hay alone, four ten gallon cans of milk daily. Considering these were many of them heifers—none more than four years old, it was a good showing for alfalfa hay.—M. E. Sherman.

USE STARTERS.

THE success of the butter maker depends upon many things, but in view of the results of the recent "contest" a reference to starters is timely. There were twenty-four entries, though the butter in only half of them was made from cream ripened with a starter. Of course, "one swallow does not make a summer," neither do the facts obtained from one contest prove or disprove the value of starters. However, it is a significent fact that in the recent contest practically all the butter grading as extras was made with a starter. This whole field has been gone over so carefully in other states that it seems like ancient history to resurrect the subject. It is untimely to argue that starters are valuable aids to butter making; that fact has long been demonstrated. I refer to it now, because we were forcibly struck by the failure of so many to take advantage of the starter in controlling flavor in the entries submitted to the recent contest.

Several used such a small quantity that under the best of circumstances it could have little or no beneficial effect. With ordinary sour cream two to four per cent of starter is not enough. It is one thing to use starter, but quite another to use it properly. When used in sufficient amounts, the good effects were unmistakable. The highest scoring entry was made by using 15 per cent starter. Then again, it depends not only upon the quantity, but also upon the quality of the starter. A poor starter is worse than none. A good starter is indespensible to the making of good butter from gathered cream. California buttermakers are evidently not using starters generally. If not, it is a great mistake and needs immediate attention.

How To Make A Starter.

A starter can is inexpensive and ought to find its way into every creamery. In case it doesn't, a good starter may be made in a milk can or shot-gun cans to be found in all creameries. Clean, fresh whole milk or skim milk can be used, but as the top has to be thrown away the latter is preferable. Place in clean vessel and hold at 70 to 80 degrees Far., 18 to 24 hours until sour. Remove about an inch of the top and it is ready to add to the cream. The skim milk used, should be selected with care, preferably from a herd that is carefully handled. Often the milk of a single cow is allowed to sour and used to inoculate a larger quantity of pastuerized skim milk (180 degrees) thus constituting a starter. These are natural or home made starters and when cultivated from clean milk they give excellent results.

By inoculating a sufficient quantity of pasteurized skim milk with an artificial culture, the so-called commercial starter is produced. These, too, require care in preparation and protection from contamination. If the coagulated mass has a clean milk acid taste and aroma, it indicates a good starter. Nothing short of a clean flavor should be used as its purpose is to improve the condition of the cream to which it is added. Stir it well when added to the cream.

Amount to Use.

One of the buttermaker's difficulties is to secure enough skim milk for starter making purposes. Every effort should be made to secure enough so that from 10 to 25 per cent of starter may be used. With rich cream more can be used than with thin cream, as the dilution of the thin cream affects the ease of churning. With 30 to 35 per cent cream, 20 per cent of starter can be used to advantage. Prepare it carefully and add as liberally as the cream will permit for thorough pasteurization and starters only, can California butter be immediately improved. Begin now to use starters if you never have used them before.—Herbert A. Hopper, University Farm.

A HOT SUMMER ON THE WAY.

As the balmy spring days swing by, one by one, and the coming of summer is heralded by an occasional hot day, it all serves as a reminder of the heat of previous summers and of the fact that no matter how hot the coming summer may be, there will be the usual work to do in the kitchen.

In homes where the work is done on a hot coal or wood stove, the situation is a particularly trying one—as it means added heat and discomfort—to say nothing of the trouble of carrying coal, wood and ashes; of having to wait for the fire to get started; and of having to keep it going when not actually needed.

But there is now a way by which all this unnecessary discomfort and trouble can be easily avoided—a way by which the cooking, baking, washing and ironing may be done without having an extra degree of heat in the kitchen. This happy result may be accomplished with the New Perfection Wick Blue Flame Oil Cook-Stove, a wonderful cook stove so constructed that all the heat is concentrated in the cooking, baking, in the heating of the irons and wash boiler, without being thrown off into the room to make an unbearably hot temperature.

Besides this great feature of comfort, the convenience must also be considered; and it is here, too, that the "New Perfection" excels the coal and wood stove. It is ready for business the moment the match is applied; it can be turned "low," "medium" or "high" at will; or, if required, three different sized flames can be had at the same time.

There is no stove work that the "New Perfection" will not do. From morning till night—from Monday to Sunday—from wash-day to baking day its usefulness is without end. And it does its work so quickly. No waiting for fire to get started—no late meals—no uncertain results.

The "New Perfection" burns ordinary kerosene and soon saves its own cost in fuel-economy. It is the only oil stove with a cabinet top—a feature which gives it the appearance of a modern steel range. Meals can be kept hot after they are removed from the blaze. It is also fitted with drop shelves that may be used for keeping hot the tea or coffee pot. Shelves can be folded back when not in use. Also has racks for holding towels.

Another home comfort is the Rayo Lamp, a lamp that produces a clear, steady light of unusual brilliancy, and yet so mellow as not to hurt the eyes. Made of brass, beautifully nickeled, and having a handsome shade, it is an ornament to any room, and can be used with equal satisfaction in the library, dining-room, living room, parlor or bedroom.

The New Perfection Wick Blue Flame Oil Cook-Stove and the Rayo Lamp are two articles of real home comfort, and are effecting a great saving of time, trouble and health in thousands of home everywhere.

KALE AS A WINTER FOOD FOR SWINE.

Hog raising in Oregon has, as a general rule, not been considered a very profitable branch of the live-stock industry. Especially is this true of the methods employed on the farm. And up to within the past few years the growing of more pork than used on the farm was an exception. But since creameries, cheese factories, and the growing of the thousand-headed kale have come into vogue in this state, especially in the Willamette valley, the pig industry has made a healthy growth.

The creameries and cheese factories create a large by-product of skim milk and whey, both of which when properly used make cheap and valuable pig foods.

Since the acreage of corn in this state is small, grain of all kinds is too high priced for Oregon farmers to feed their pigs through the winter months and compete successfully in pork production with the pork-producing farmers of Nebraska and Iowa.

Grain too Expensive.

The pork producing problem in Oregon necessarily resolves itself into pigs with a minimum amount of grain and a maximum amount of skim milk, whey and kale, or other cheap foods. Some dairymen have solved the problem by giving skim milk and whey as the cheap maximum ration and adding just enough grain, usually bran or shorts, to give the best results. This combination of food stuffs is generally fed in the proportion of one pound of grain to three pounds of skim milk or six pounds of whey.

The skim milk or whey and the grain feeding problem as indicated above, has been pretty well solved and is demonstrated by the fact that some succulent food is highly necessary if the pigs are to be made to do their best through the winter months in growing and remaining healthy.

The thousand-headed kale has been introduced as a substitute for this long-needed cheap food. It is a very succulent nutritious forage plant much grown in England and France, but of late it has been found admirably adapted to the most mild climate of the northern Pacific Coast region and is likely to be of much wider adaptation, especially where the winters are not too severe. It is closely related to rape, but the plants are much taller and the leaves are much larger, longer and broader. It does not head up like cabbage. The name thousand-headed kale refers to the numerous branches the plant has when given plenty of room to grow in.

Its Value.

For the purpose of ascertaining the value of kale as a winter food for hogs, an experiment was conducted from the 1st of December, 1907, to the 1st of March, 1908. Nine pigs were selected and placed in two lots. Lot 1 consisted of three mature hogs and lot 2 consisted of six young shoats weighing about ninety-three pounds each.

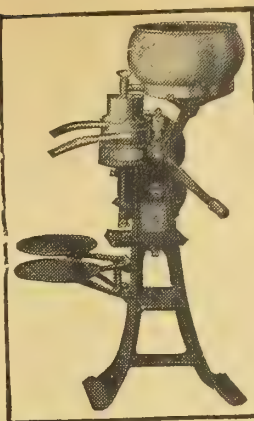
One sow in lot 1 farrowed pigs about the middle of the second period and hence was taken out, thus accounting for the loss. The remaining two finished the period in good condition.

Lot 1 was taken out of the experiment at the end of the second period and lot 3 added, which consisted of three young pigs of Berkshire crosses and weighing about sixty-one and one-half pounds each. They were fed all the kale they would eat up clean and given skim milk and whey to drink instead of feeding chopped wheat as in lot 2.

In lot 1 the pigs did not seem satisfied during the experiment and it was difficult to get them to eat the kale up clean. At first they would not eat it at all, but later they became accustomed to it and ate it fairly well. Lots 2 and 3 took to eating it very readily and cleaned up all that was given them. They seemed to be more satisfied, were in better condition, and made better gain than lot 1. Lot 3 fed very evenly on the amounts of kale from day to day and seemed to do fairly well. The combination of kale and skim milk made a rather watery feed and the pen was continually wet and sloppy. The combination was lacking in crude fibre but for the short period the pigs did well without it. In conclusion, we say that kale is almost a winter maintenance ration for swine, but when fed in addition to a little grain or skim milk good growth may be made. Especially is this true of young pigs, as has been denoted by the tables. Taking all in all the feeding of kale to swine will be a cheap method of carrying pigs through the winter months.—Oregon Countryman.

Stock in the Mountain Meadows.

The secret of keeping the boys on the farm is in keeping them interested. One of the main reasons why they leave is because they can do better elsewhere so far as money is concerned. Away from home they command a money wage at once. Of course it is seldom that their condition as a whole is improved. Fathers must remember, however, that a real dollar looks as big to the boy when it's "his very own" as the hind wheel of a wagon.



TEN YEARS AHEAD OF ALL OTHER
CREAM SEPARATORS

In skimming efficiency, simplicity, durability and convenience, the new 1908-1909 improved De Laval Cream Separators are fully ten years ahead of any other machine on the market today. Thirty years of experience, protecting patents, and the many valuable improvements devised and perfected by the De Laval engineers in all parts of the world during the past three years, are responsible for this fact. Every feature of the De Laval has been improved, from the supply can to the base. The new centre-balanced bowl with its separate spindle is alone a triumph in separator construction and must be seen to be fully appreciated. Then, there is the new one-piece "anti-splash" sanitary supply can, adjustable shelves for skim-milk and cream receptacles, new frame designs, and many other but less important improvements,—all combining to make the De Laval as nearly ideal as a separator for farm and dairy use can be made. There is the proper size machine for every size dairy from the smallest to the largest and no cow owner can afford to be without one of these improved machines. It will cost you nothing to see and examine the new De Laval and right at your own home too, if you will but say the word. Our new illustrated catalog describing the De Laval improvements in detail is sent for the asking. Write us at once and you will receive this interesting book by first mail will full information as to how you may have a free demonstration of the improved De Laval in your own home. It will pay you to do so and your only regret will be that you didn't investigate sooner.

The Frictionless Empire

Have you seen the ballbearing, in the Frictionless Empire Separator? If not, you should do so and examine it. It prevents all wear on the bowl spindle; it reduces oiling to the very minimum; it consists of a bushing, through which the bowl spindle passes, and this bushing revolves with the bowl on the balls encircling it, thus making it practically Frictionless, and protecting the spindle from wear, which helps to make the Empire the easiest running machine on the market.
This is only one of the many leading features of the Empire.

Deciduous Fruit Culture

By J. W. Mills

CONSUMPTION OF RAISINS.

THE present time, when much interest is being shown in the promotion of the consumption of California raisins, seems a favorable opportunity to endeavor to enlighten the general public as to its great value, and the comparative neglect with which it has hitherto been treated, writes George Robertson in Fresno Republican.

An effort is now being made to increase the consumption of this old and well-tried product in the United States, and there is no reason why it should not prove a great success, as there is ample room for a great development in the marketing of raisins.

To give a practical illustration of this fact it should only be necessary to quote a few figures, which will speak for themselves.

In the United Kingdom.

It may be said, without exaggeration, that for generations the United Kingdom has always been the greatest market for raisins and currants. It has been an almost daily article of diet in some shape or form for both old and young, especially the latter. The boys of Christ's hospital, London, the well known "Blue Coat School," a large and ancient institution, receive a packet of raisins annually, the funds for which were left by one Peter Symonds, in his will dated 1586.

The United Kingdom, as already stated, is not only the largest consumer of raisins and currants, but also the leading distributing center, large quantities of both fruits being exported out of bond, especially from London.

In order however to make the quantities consumed in the United Kingdom exact, the figures for home consumption only are here given, the balance being exported to other countries. In the case of the United States, or more accurately, California, this unfortunately is not possible. It is true that the imports and exports are exact, but the total amount of the crop, and of the holdover when there is one amounting to anything, is a question of estimates.

The population of the United Kingdom according to the last census, amounts to 41,459,000, and that of the United States, 75,694,000.

The home consumption of raisins in the United Kingdom was 73,161,312 pounds, currants, 142,789,696 pounds. Total, 215,951,008.

Equal to per head of population, almost exactly five pounds.

	Pounds
California raisin crop 1908,	100,000,000
Holdover, say, ...	60,000,000
	40,000,000
Add imported raisins 1908..	4,875,691
	44,875,691
Less exported Cal. raisins..	7,084,178
	37,791,513
Currants imported	29,436,151
Total	67,227,664

Equal to .89 pound per head of population, but allowing for under estimates, we may safely call it one pound per head of population, compared with five pounds per head in the United Kingdom.

This clearly proves the large margin there is between the amount now consumed in this country and the extent to which the consumption might be developed; in other words, if the people appreciated raisins as they have done for centuries in Europe, the acreage in raisin grapes might be more than doubled, and the growers still obtain a fair price for their products.

Raisins as Food.

In Europe the "grape cure" is of long standing and thousands flock annually to the vineyards of the Rhine, Danube, and the Moselle, for the grapes, which are regarded as a universal remedy for impaired digestion, and diseases of the bowels and kidneys.

Each one begins with half a pound daily, increasing gradually to four or five pounds a day.

The food value of the grape or raisin is greater than that of any other fruit in popular consumption. This superior nutrient quality is due to the large amount of sugar, also of gluten, mineral salts, and fruit acids, together with a lesser quantity of water than usual in fruits. Grape sugar is the chief nutritive constituent. The particular advantage which grape-sugar possesses over all other types of sugar is the ease of its assimilation. Grape-sugar, unlike other sugars, is naturally in the state to which all other carbohydrates must be reduced by preliminary digestion before they are ready to be absorbed by the system.

Another authority states that it is the sugar especially that gives food value, while the mild acids help in other ways in the maintenance of good health. The diet of the young, especially, can be advantageously modified by the liberal use of such an article of food as raisins. Much more might be written on this subject.

Currant Advertising.

A few years ago the Greek currant growers found themselves in much the same predicament as the California raisin growers today, owing to over production and low prices. The Greek government came to their rescue, and organized a corporation under the title of the "Societe Privilegee Pour Favoviser la Production et la Commerce du Raisin de Corinth," which now controls the crop.

In the two years ending 1906-7, they spent $175,000 in advertising to bring the value of currants as a food before the British public. It serves as an illustration of the remunerative advantages of advertising, that, in spite of this heavy expenditure, they secured an increased net profit of nearly three times what they earned in the previous year.

PROTECTING VINEYARDS IN FRANCE.

The vineyardists of some sections of France sustain great losses some years by frosts after growth has started in the spring and from hail storms when the crop is maturing. The growers often resort to smudging as we do and here is their process: Small wooden boxes open at the top are filled with an inflammable composition consisting of a mixture of equal parts of resinous with earthy matters—clay, terra alba and the like—reduced to a fine powder and pressed into a compact mass. In the center a wick extends through the compound and serves to kindle it. The wick, however, may be dispensed with and the composition ignited by pouring a few drops of alcohol, petroleum or other inflammable oil over the mass and applying a match. These boxes, about eight inches long by six wide, made of pine wood ordinarily, are placed in line about thirty feet apart around certain areas, say of fifty acres. There is but little danger of frost when a dark or cloudy morning follows a cold night. The trouble comes when the first rays of the morning sun strike the almost

frozen and unprotected plants. By the smudging process a dense cloud of smoke is produced, hanging over the vineyard long enough to protect the plants from the sun's rays and give them a chance to recuperate from the dangerous effects of the frost. The composition in the boxes to windward only is ignited, the thick, black, heavy smoke hanging over the field forming a shield against the sun's rays. If it is desired to extinguish the fires it is only necessary to have an open box a trifle larger than the other by means of which the flames are quickly smothered.—Field and Farm.

APRICOT OUTPUT.

Continuation of Apricot estimates may be seen on page 441.

George C. Roeding

WE recently heard a keen and observing man say that the one man who had the best grasp on the horticultural situation in California, especially from a commercial standpoint, was Mr. Geo. C. Roeding of Fresno. Mr. Roeding has spent his life in horticultural work in this state and has built up what is doubtless the largest nursery business on the Coast. These nurseries in four different tracts cover a total of nearly 1700 acres and the products from them have been planted in very nearly every nation in the world, and we doubt if Mr. Roeding's advertising campaign carried on in many countries has not been a great factor in making known the extensiveness of the fruit industry of this state. These

nurseries have the widest range of products, though deciduous fruits and grape vines are the strongest factor.

Their magnitude cannot be appreciated excepting by one who drives over them and sees the intensive culture necessary to produce such plants as are raised. But something of an idea of the extent may be had from the book "California Horticulture," written by Mr. Roeding and in which is a list of the plants grown. This book in its way is one of the most complete that refers to fruit culture which this state has yet produced.

But Mr. Roeding's principal credit is not so much from writing books as in doing things. If there is a hard worker in the world it's Roeding. His day's work is two for the ordinary man—in other words sixteen to eighteen hours and under most complete system at that. Each day's mail brings to his desk a stack of letters approximately a yard high.

This strenuous life is made necessary by his own large interests, and in addition by his work for the public welfare, which of course, always falls to the busiest of men.

Only this week we had a chat with Mr. Roeding while in the South on a mission for this state in preparing for the Alaska-Yukon-Pacific Exposition. He is in charge of the Department of Horticulture for California. His duty is the arranging of horticultural and ornamental plant exhibits in the California building and grounds. It may be said that such work is in the interests of publicity or of advertising of the advantages of California's wonderful climate and soil. This is desirable even necessary in order to bring to our rich valleys the capital and labor necessary for their development.

Mr. Roeding's greatest work, we believe, is in making a commercial success of fig culture in this state. To him more than any other one belongs the credit of the introduction of Blastophaga or the little insect which first made fig culture possible. We are of course well aware that in this matter others would take the greater credit but we know that the suggestions as given to the Department of Agriculture that the introduction of this little insect might be accomplished through the department was made by Mr. Roeding. Prof. Swingle at that time in Asia Minor was deputized to bring a number of the insects to America. This was done and later Mr. Roeding, to secure a more perfect knowledge of the methods of work there and also to secure a further importation of the insects made a trip to Asia Minor. This enterprising citizen of our own state not only initiated the movement for the introduction of the insect but has followed up with his own personal efforts to secure results and consequent great profit to the fruit industry.

We are glad to present a photograph of Mr. Roeding to our readers.

LARGEST VEHICLE MAKERS IN THE WORLD
Studebaker
THE STUDEBAKER PLANT COVERS 101 ACRES

Means Lowest Yearly Cost

The greatest economy in buying a farm wagon lies in its years of service,—a *Studebaker* will last so much longer than an "ordinary" wagon that no matter how cheap the ordinary wagon may be the *Studebaker* costs less in the end. *Studebaker* quality has its basis in fact: Every piece of lumber in the *Studebaker* wagon is air seasoned two to three years. If it isn't right then it isn't used. Trained men select New England black birch hubs; choice white oak for spokes and felloes; the best butt cut, second growth hickory for axles; that's the quality of material. Then every *Studebaker* wagon is ironed and reinforced in every way that will add strength, with refined iron; then painted in a thorough and durable manner. These are the reasons why the *Studebaker* wagon has kept the lead for nearly 60 years.

DIRECTIONS FOR DESTROYING POCKET GOPHERS.

From a bulletin written by David E. Lantz, assistant in the Bureau of Biological Survey, we note the following regarding gophers:

Pocket gophers infest all the States and Territories west of the Mississippi, and parts of Illinois, Wisconsin, Florida, Georgia, and Alabama. They occur also in southwestern Canada and over the greater part of Mexico.

Throughout their range pocket gophers are very destructive to crops. They eat the roots of fruit trees and in this way sometimes ruin whole orchards. They eat both roots and tops of clover, alfalfa, grasses, grains, and vegetables, and are especially harmful to potatoes and other tuberous crops. Besides this, they throw up innumerable mounds of earth in meadows, pastures, and grain fields, which cover and destroy far more of the crop than is eaten by the animals or killed by having the roots cut off. These mounds also prevent close mowing, so that much of the hay crop is lost, and the pebbles they contain often break or injure farm machinery.

Pocket gophers may be destroyed by poison, by traps, and by the use of carbon bisulphid.

Poisoning Pocket Gophers.

Poisoning with strychnine is the most effective means known for killing pocket gophers, and, as it involves the least expenditure of money and labor, the Biological Survey recommends it for general use. As a rodent poison to be used by farmers, strychnine has several advantages. Its action is sure, its deadly character is known to most persons, and its bitter taste is an additional safeguard against mistaking it for a harmless drug. Strychnia sulphate is the most convenient form of the poison, since it is freely soluble in hot water and in the natural juices of vegetables used as bait. To disguise its bitterness so that rodents may not be deterred from eating the baits, sugar is often employed, or the strychnine may be mixed with its own bulk of commercial saccharine. A sugar syrup poisoned with strychnine may be used with excellent results. It is prepared as follows:

Dissolve an ounce of strychnia sulphate in a pint of boiling water. Add a pint of thick sugar syrup, and stir thoroughly. The syrup is usually scented by adding a few drops of oil of anise, but this is not essential. If preserved in a closed vessel, the syrup will keep indefinitely.

The above quantity is sufficient to poison a half bushel of shelled corn or other grain (corn recommended). The grain is steeped in hot water and allowed to soak over night. It is then drained and soaked for several hours in the poisoned syrup. Before using, corn meal may be added to take up the excess of moisture.

Dry crystals of strychnine also may be used. They are introduced, by means of a knife, into small pieces of potato, carrot, or sweet potato, or into entire raisins or dried prunes. A single large crystal (or several small ones) is enough for each bait. Raisins are especially recommended because they are easily handled and contain enough sugar to disguise the bitterness of the poison.

Select the freshest hill or mound and with a narrow garden trowel follow the soft earth of the tunnel until the main runway is reached. By noting the direction from which the earth was pushed out and locating the closed entrance, the burrow may be readily followed and the main runway quickly found. The poisoned raisin, corn, or small potato should be placed well back in the main runway and the openings closed.

Trapping Pocket Gophers.

Trapping is a successful method when followed intelligently and persistently. It is especially adapted to small fields, orchards, gardens, and irrigation embankments, where only a few gophers are present; but in the case of large areas that are badly infested, the method involves too much labor.

In using the ordinary steel trap, the first step is to make an opening into the main gopher tunnel. The trap should then be sunk so that the jaws are level with the bottom of the runway and lightly covered with green clover, alfalfa grass, or even loose soil, care being taken that these do not clog under the pan, or trigger. No bait is required. The hole should be just large enough to receive the trap and should be covered so as almost to exclude the light. Scalding the trap frequently to remove the animal odor is important.

Some of the special gopher traps possess the advantages of ease and simplicity of operation, and kill the animals instantly. These special traps should be set in the laterals leading into the main tunnel of the gopher, or at the entrance of open burrows where fresh earth is being thrown out. The trapper should choose the freshest of a series of mounds and dig along the lateral until it is found clear of soil.

Carbon Bisulphid.

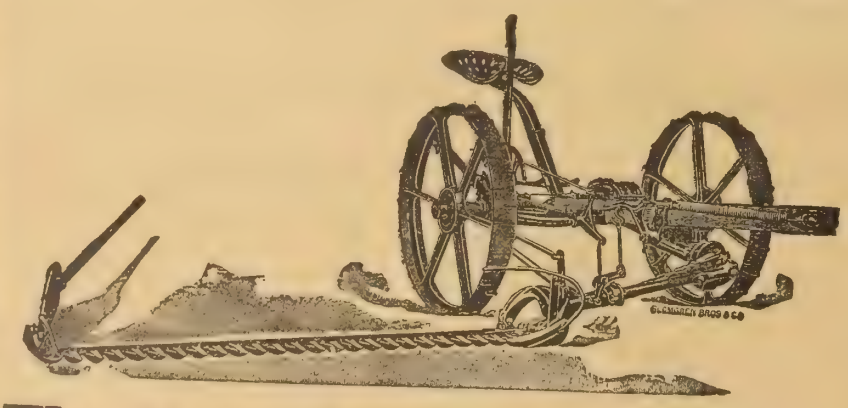
Carbon bisulphid has been employed for killing pocket gophers, and under favorable conditions its use is recommended. If the burrows are extensive or the soil dry, the gases are dissipated so rapidly that a large quantity of the liquid is required to kill the animals and the method becomes too expensive. If, however, the burrows are simple and the soil moist, bisulphid may be used successfully. For pocket gophers an ounce of the liquid for each burrow is sufficient. The carbon bisulphid is poured over a bunch of cotton, rags, or other waste material and this quickly pushed into the burrow, which should be closed at once.

Co-Operation.

Any farmer may readily rid his premises of gophers by the use of poison or traps. Unless, however, the entire community unites in active and intelligent co-operation in the de-

The Cost of the best Mower is lower than the cost of the cheapest Mower at the end of one season's use.

The best Mower gives the best service all the time.



The New Standard Mower

TIME AND LABOR-SAVING DEVICES and DEVICES FOR PREVENTING FRICTION found only on the NEW STANDARD MOWER.

The floating cutter-bar provides a frictionless channel for the knife and prevents wear on the guards. The guards are protected by chilled reversible rails, found only on the NEW STANDARD. Sixty cents will replace an entire set of rails on a five foot bar. To replace only two guards on other mowers will cost as much.

All shafts run in detachable sleeves and there is no wear on the main frame. The benefits of this construction more than warrants the cost.

A force-feed cup grease oiler is part of the pitman box. The screw cap is held in place by a spring and cannot work loose. One turn of the cap supplies ample lubricant and overcomes hot boxes and delays incident to the use of fluid oil. Hours are saved during harvest (when hours mean money) by this device, found only on the NEW STANDARD.

These are only a few of the prominent labor and time-saving devices which decrease the operating cost and add to the life of the NEW STANDARD MOWER.

Our illustrated Hay Tool Folder describes these features in detail and also tells why the New Standard Mower is the Easiest Running, Most Powerful Cutting and Longest-lived Mower made. Write for the folder today.

Newell Mathews Co.
200 North Los Angeles Street
Los Angeles, California

struction of the animals, the cleared area will be sooner or later invaded from neighboring premises, and the work of destruction must be repeated. Co-operation only will effect a radical cure. When co-operative efforts for the extermination of gophers over a considerable area are attempted, careful attention must be given to waste lands along fences, streams, public highways, and railroads.

THE FARMER A FACTOR.

As to the farmer's own estimate of his position in commercial life the Bakersfield Echo remarks:

"As a matter of fact it takes the smartest of men to make thoroughly good farmers. Any man with strong legs can follow a harrow, but that is not the whole of farming. To be a complete success on a farm a man must know a lot about most of the trades and nearly all the professions and in addition to that he must have as much business ability and good judgment as suffices the average business man. Added to his mental equipment he must have a sound body, and finally he must have as much capital as would start him comfortably in any of a dozen lines of business, or he must have the grit, courage, daring, resource and self-sacrifice to get along without money when by all self-evident rules money is absolutely necessary.

Figure 80 acres of good land in alfalfa at $100 per acre; add $1500 for a modest house; $500 for a barn, cow sheds, separator house, chicken houses, etc.; $300 for corrals and yards; $150 for other small buildings and improvements around the house, four horses at $125; two wagons for $250; mowing machines, rake, scraper, plows, cultivator and other implements at $250; small tools at $50; twenty cows at $50; separator, cans, etc., $100; and you have over $12,500 invested in what would be by no means a pretentious or extravagantly equipped farm.

Twelve thousand dollars will finance any one of several highly respected commercial enterprises and entitle the proprietor to rank among the business men in the community. Three or four men with $12,500 each can start a bank and pose as financiers, and sometimes a man with $12,500 can loan it out at 12 per cent and make his neighbors think he is an eccentric capitalist.

But when the farmer who has an 80-acre ranch of this sort, who has bought it and paid for it and built it up by economy, good management and hard work he is quite as likely as not to rank himself commercially with the proprietor of the peanut stand on the corner and if he happens to meet a drygoods clerk in the door of the post office he instinctively stands back and lets the clerk pass first.

A lot of people talk about the great need of intelligent farmers, and there is no question that no degree of intelligence is likely to be wasted on a farm, but as a matter of fact, the farmer who makes any success in his business is generally quite the equal intellectually of the successful merchant or professional man. The farmer spreads his knowledge and study over more subjects than most men, that is all.

The farmer is entitled to magnify his calling, to consider himself the salt of the earth, the backbone of the republic, the substantial, important element of the community. He is entitled to buy himself a green hat and stick out his elbows when he walks down the sidewalk, and if he does not do so it is merely an indication of his modesty and consideration and should win him increased honor and respect.

MANY NATIONS TO EXHIBIT DRY FARM CROPS.

The next sessions of the Dry Farming Congress will be held at Billings, Montana, some time during the fall of this year. The date was not determined at the recent convention at Cheyenne, but will be selected during the autumn months in order to enable the farmers to take to the Congress exhibits of their crops that will show to better advantage what has been done by dry farmers than is possible when the Congress meets many months after the harvest. Secretary-Treasurer John T. Burns has taken up the matter of an international exposition of dry farm products with the governments of a number of foreign countries and has received assurances from Brazil, Mexico, Australia and other lands that they will send exhibits to Billings. The people of Billings are taking an active interest in the movement and promise that the coming Congress and its exposition shall be one of the greatest in the history of dry farming.

TEN COMMANDMENTS.

1. Don't think about buying a farm if your wife won't live in the country.
2. Don't believe agents when they tell you gold-brick stories.
3. Don't chase after big farms.
4. Don't buy a farm unless you have money enough left to buy a cow.
5. Don't settle far away from the markets.
6. Don't run too much in debt when you buy your farm.
7. Don't pay a deposit on your farm until you have consulted a lawyer.
8. Don't forget to insure your farm buildings in a reliable company.
9. Don't buy a farm unless you are able to meet the mortgages.
10. Don't buy a farm unless you have consulted those who know.—Ex.

Fruit growers of Eagle Valley, near Richland, Oregon, are making a concerted fight on San Jose scale which is becoming a serious pest.

AMERICAN FENCE

To get the most out of a farm, every square foot must be either tilled or else made to produce feed for live stock. A fence all around the farm, then cross fences, making more and smaller fields—permitting rotation of crops and change of pasture—are first essentialsin making possible maximum earnings.

Here are two great fences—the best square mesh and the best diamond mesh. We selected these two styles years ago, after careful study and advice from many of the most experienced and successful farmers, the correctness of which has been verified by actual results in the field. These fences are the simplest in construction; are made of any size or weight of wire desired and perfectly adapted to all uses and conditions.

If you want square mesh, buy American; if you like diamond, buy Ellwood. You can safely take the verdict of the millions of farmers who have tested and tried out these two great fences. Dealers everywhere, carrying styles adapted to every purpose. See them. Catalogue for the asking.

California Farm Names

FARM NAMES.

NOW and then the Cultivator has given some space to farm names but owing to being crowded recently has allowed them to accumulate without their appearing in the paper. We give, however, this week, another installment and think that the law recently enacted which grants copyright privileges will stimulate this move until we will be compelled to give space to it each week. Within the next week or two we hope to give the necessary steps to take in order to secure under this new law these privileges. Papers generally over the state have commented favorably upon it and we have seen no adverse criticism. In fact there can be none for benefit can only come from this move besides the copyright or trade mark privilege will give the incentive to build up a brand for fruits or products of the ranch which will mean a greater pride in the place and it is encouraging a custom which is bound to increase as its merits are more fully understood.

In our list of names this week we note the following:

"Woodside Ranch" owner, H. D. Williamson, Santee, San Diego, Co., California. Mr. Williamson has a well printed letterhead on bond paper with the ranch name. Underneath is "Alfalfa, Live Stock and Dairy." In the upper right hand corner "Over 250 miner's inches of water developed and used in irrigation." In the left hand corner of the letterhead is "San Diego County. Climate most perfect in the world, either in the mountains or by the sea. All grains, fruits and vegetables of the United States raised successfully." "The 'only' place to live. A Paradise for the saints, an Eden for the others."

"Soy-Wild"—owners Mr. and Mrs. N. B. Olds and Miss Ella Dillon, Ceres, Stanlisaus County, California. Mr. Olds writes: "I will be pleased to have the name of our little farm appear amongst the other farm names. We have lately purchased this farm of twenty acres. It is located three miles east of Ceres, Stanlisaus County and one and a half miles south of Hughson. It is under the Turlock irrigation district. I have twelve acres of alfalfa, Grenach grapes, four years old; 250 fig trees four years old, together with family orchard of all kinds of fruit. Grounds about house supplied with shade and ornamental trees together with a comfortable six-room house, with large barn and other buildings, and windmill tank, so that we think very much of our new home.

"Alpha-Dune Ranch"—owner, J. J. Smith, Brooks, Yolo County. Mr. Smith writes us on a neatly printed letterhead. In the corners are small panels with "A specialty of horses and cattle" and "Hay, unirrigated alfalfa seed and cream." Mr. Smith says "I am sending you the name of our farm home which is situated about midway in the Capay Valley in Western Yolo County. This valley is by nature one of the prettiest and best in the nation. The name is suggested first, by the broad unirrigated fields of alfalfa. Second, by the dwelling house and one of the barns being situated on a gentle hillock overlooking the valley. The name "Alfa-Dune" is inlaid in a concrete arch which forms the front walk 'gate' by the roadside. Also the front drive gate posts are made of concrete, the whole arch and posts being built in place and reinforced by two inch gas-pipe. The walks are of cement, the borders and main posts being made of colored cement in imitation of brown sandstone. The dwelling is frame, finished by a blending of old colonial and modern bungalow types, with cement steps and cobblestone front and basework. A large oak like those of "Bashon" shades the backyard. Also one shades the barnyard. The barns are of the old New England type, the other buildings embracing the far Eastern and Southern California styles. Three spring brooks cross the ranch, as does also the Vacaville, Capay and Clear Lake railroad."

"Belle View Ranch"—owner, M. C. Kelley, San Dimas, Los Angeles County, California. Mr. Kelley says: "I note in the last issue of the Cultivator in which you have farm names that another subscriber has taken the same name which I had selected for my ranch, namely, 'Mountain View' ranch. Hence I have changed and have selected the name given above. Has any other chosen this name? Is there any law against using the same name or is there likely to be? I do not wish to change after once using this name. I like this idea of naming the ranch or farm very much."

There has been enacted a law which grants copyright privileges to farm names. The fact that one has chosen a certain name does not however give its exclusive use. The first to apply to the proper authorities will secure this copyright privilege for the particular name in question. As noted above, we will give the steps necessary as soon as it is possible to secure them from Sacramento.

"Forest Oaks Ranch"—owner, A. E. Bennett, Tustin, Orange County; manager, J. V. Clifford on the ranch at Tulare, Tulare county. The manager, Mr. Clifford, writes on beautiful, specially designed letter-head, showing "Forest Oaks" in rustic letters while underneath on a background of oak leaves and acorns appears "Alfalfa and Stock Ranch."

Other names already in hand will be given in an early issue.

A large committee of bean growers at Oxnard is working persistently for a co-operative bean marketing organization.

HOW TO BUILD RURAL TELEPHONE LINES.

A booklet has just been received from the Western Electric Company and its subject is "How to Build Telephone Lines." Every farmer knows the value of a telephone, but most of them think it requires an expert to put up a system; and only a few know how easy it is to organize a company and build a line which will give good service at a moderate cost.

This booklet tells you how to construct a telephone line, how to install the instruments and connect them to the line, the material needed and the cost. This book is handsomely illustrated and the Western Electric Company, who are the largest manufacturers of telephones and telephone apparatus in the world, furnishing all the equipment used in the entire "Bell" system, advise us that they will mail the book free to any readers of this paper who care to write for it. The address of the Western Electric Company can be found from their advertisement, which appears in this issue.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

CALIFORNIA CARDINALS.

IT HAS been said, "Of making breeds there is no end" and it will be true to the end of time, that new combinations of blood will produce new types some improvements upon established breeds, and some not.

While living back East, I became interested in producing a combless fowl, so bred one family of Buckeyes without combs for an experiment, by selecting the smallest combed birds from year to year until feathers actually grew in place of combs in a few rare specimens.

These fowls I called National Reds, after breeding them smaller in size and with more dark undercolor than the Buckeyes, and in shape I selected birds as nearly like the photo as possible. This photo was taken from a rose comb R. I. Red I once raised, and Franklane Sewall acknowledged the foremost poultry artist and "chalk-talk" lecturer in the country, pronounced it the most ideal shaped R. I. Red he had seen to date. "Just what I have illustrated in my chalk-talks as the laying type," to quote from his letter.

A R. I. Red.

Now, combless fowls appeal to very few people, I find, and since coming to California, I have been looking about me for what this country needs in a chicken and believe by using these pretty, dark red National Reds of mine for a foundation, I can produce a breed exactly suited to conditions here.

Not but Buckeyes are all right here, but they are larger than many people care for, besides being very scarce and high-priced. Leghorns are too small and nervous, and right between these two there is room for a medium sized breed, and this want I aim to fill and clothe it in the richest of dark red plumage. Combs there shall be, too, all kinds of combs, Rose single and Pea-combs, so all may be pleased, and the American Poultry Association need not worry a mite about these birds, for this State is big enough to have a breed all its own and own its own Standard, too, so I shall not ask admission to the Standard of Perfection for this breed, but keep the Standard for the use of those who buy eggs and breed them.

Weights for this breed shall run from five pounds for hen, to seven pounds for cock, making a nice sized fowl for the table, and not too large for sitters and mothers. Eggs are the main dependence of most chicken raisers, so the egg type will be carefully selected, and if California Cardinals do not succeed, it will not be my fault.

The making of this breed and the naming of them for the state of my adoption is a labor of love for the benefits derived from this glorious climate. It has restored to me and mine the health we thought forever lost, and given a zest and enjoyment to life we never expected to find again.

Back there in the cold and snow, I had even begun to lose interest in my Buckeyes, here, I feel not only renewed interest in them, but able to tackle this new combination, and work out a new breed; the Leghorns of the Reds.—Mrs. Frank Metcalf.

POULTRY QUERIES.

Liver Enlarged.

We killed a hen; her comb was bright red, appeared healthy, was laying and as fat as she could be. When her legs were cut off we discovered the connective tissue to be completely covered with little white lumps about the size of a pinhead. When these were broken, they were found to be full of brown pus. The oil sack was very much enlarged and filled with brownish pus. Her liver was very soft and seemed to drop to pieces when touched; very light yellow—A. L. C.,Kingsburg.

The hen had become too fat from too much fat-producing food, probably not enough exercise, and had liver enlargement. Was on the way to apoplexy, or some other fatal sickness arising from liver trouble. A change of food, and more exercise, with a dose of castor oil or some Epsom salts in the drinking water might

When the chicks are hatched don't feed them anything for 24 hours, then feed them the best dry Chick Feed you can get. We say that is

West Coast Chick Feed

SAMUEL R. KELLAM, former president of the L. A. Co. Poultry Association, says: "West Coast Chick Feed is the best feed for young chicks I have ever used. I have given this feed a thorough test, and have always found that it produced fine, large, healthy chicks."

MRS. A. BASLEY, the celebrated poultry authority, says. "I want some more of your West Coast Chick Feed, for it is excellent. It is purer, cleaner and appears better balanced than other feed I had been using, and to tell the truth, I have been experimenting, feeding both together, and they always eat yours in preference."

Ask your neighbors, for there is more of "West Coast" sold in Southern California than all other kinds put together. If not sold by your dealer send us $3.50 and we will send a 100 lb. sack, freight prepaid within 300 miles.

have helped her. This is usually called fatty degeneration of the liver, and this sort of liver is the foundation for the "pate de foi gras," so much liked by the French.—Mrs. F. M.

Make 'Em Lay.

My Minorca hens do not lay. They are in fine condition and have good care. Have plenty of range on loamy, gravelly soil, and a variety of food. Will Mrs. Metcalf suggest something that I may get some eggs? —Mrs. L. S., Pomona.

Mrs. Metcalf might suggest a change of breed, but as the Minorcas will lay finely when the spirit moves them to do so, and such beautiful big white eggs when they do lay, Mrs. Metcalf will do no such thing. Feed them a mash well seasoned with black pepper once a day until they begin, and give them corn for supper three times a week. Whole corn or cracked, a handful to each crop. People say corn is not good for hens here in California, but my own and others' experience declare in favor of this old standby, and some even go so far as to say, "No corn, no eggs." —Mrs. M.

Pendulous Crop.

I have a hen which I thought was crop-bound and after cutting the craw open, found nothing in it. The swelling is so bad at times that the breast drags the ground. I feed wheat twice a day, they have plenty of green grass and exercise on adobe soil. No other fowl is troubled in that manner.—W. F. G.

Your hen has a pendulous crop, caused by over-feeding at some time. It is more unsightly than dangerous, although if it drags on the ground, it may become sore and inflamed. In Reliable Poultry remedies, it is advised to make an incision as for impacted crop, only longer. Cut out, with a pair of blunt-pointed scissors, both skin and crop, so the opening will look like a pair of brackets, removing quite a little membrane. Sew as described for impacted crop, being sure to sew the skin and crop separately. Feed lightly for a week, removing threads in sight at the end of four days.—Mrs. M.

Can any one tell me how to hatch turkey eggs in an incubator? If a person has good luck, is it tedious work? I have three gray geese. Can anyone tell me how to tell the goose from the gander?—S.

Personally, I never should attempt to hatch turkeys with an incubator. If you do make the attempt, be sure to keep the temperature as near 102 all through the hatch, as possible, as a variation which would not affect hen eggs will be fatal to the larger turkey eggs. It is difficult for an amateur to distinguish the sex of geese, but the gander is usually the smallest and most pugnaceous.—Mrs. M.

Practical Information.

Will you kindly tell me in the columns of our journal, as to what are the best books on poultry raising for one who has some knowledge of poultry keeping on a small scale, and who wishes to become more expert with a view of engaging in that business more extensively. Also please give practical method of detecting bad eggs in incubator or under sitting hens.—E. Y., La Mesa.

There are many excellent works on poultry raising on the markets, and a glance at the advertisements in our journal from time to time will inform you much about them. Locally, Mrs. A. Basley's Poultry Book gives much practical advice about the man-

agement of chickens, feed and care, as does Mrs. Burbridge's book and many others. Probably Wright's Poultry Book is the most complete yet published, but like all other books, the best one has never been written.

The dealers in poultry supplies who advertise in our columns carry a complete line of excellent poultry books, and can advise you which are best suited to the line of poultry keeping you propose to take up. There are so many excellent works on poultry raising that you will have no trouble in finding what you need, but it is well to subscribe to several good poultry papers, to keep in touch with all the new things which are continually coming up, and watch our columns in the Cultivator.

Subscribe for a dozen of the best journals, and keep posted on what is doing in the poultry world, thus keeping up with the times, for something new is always coming up and being threshed out in the pages of our journals. The bad eggs under hens and in incubators are those which contain dead germs, or I presume you mean those, for it is comparatively easy to distinguish the infertile eggs, by the way the light shines through them.

Dead germs are a little difficult to distinguish until about the 12th day, when the live chicks will about have filled the egg, and it shows dark almost all over, while the dead germ floats as the egg is turned, and light shines through in portions of the egg. Experts claim to be able to tell the dead eggs by contact, as the live egg is several degrees warmer.

In testing eggs, it is said to be wise to hold them sideways instead of vertically, as holding the egg vertically is said to disturb the equilbrium of the germ, and perhaps if held in that position too long to a bright light, might kill it.—Mrs. F. M.

RAISING GUINEAS.

There are two varieties of this fowl: The pearl and the white. The pearl or speckled guinea is wild and shy and the flesh when fully matured, is dark and gamey in flavor. The young guineas are of a delicate flavor and should be marketed when six months old; the flavor then resembles partridge or quail and is much esteemed.

The white guinea is handsome in appearance, and is a good table fowl, delicate in flavor, yellow skin, etc. They are more domestic in their nature and when hatched by chicken hens will readily mingle with other poultry, not being of a quarrelsome disposition as the pearl variety is—which fault has kept this breed in the background.

As foragers the guinea rivals the turkey, and it is usual with owners to let them "paddle their own canoe" after being fledged. They begin laying as soon as warm weather comes and lay almost uninterruptedly until cold weather. The white guinea will lay in the nest of the common hen, while the pearl colored will deposit her eggs in the most out-of-the-way and inaccessible places.

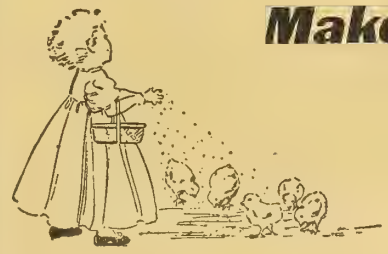
Guineas are quick to detect the presence of an enemy, whether hawk or weasel. They are first class detectives and should be kept on the farm for this purpose. Their shrill and discordant cry puts the enemy to flight before the owner can appear on the scene.—Farmers' Guide.

Spokane, Wash., is making great preparations for the coming National Irrigation Congress.

Coulson's POULTRY FOODS

Special Dry Chick Food

Makes Them Grow



COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequalled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength, and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE SAVER.

Colfax, Wash., has broken all previous records in wheat prices and in quantity of exports this year.

SOME CAUSES OF INFERTILITY.

There is always a cause, sometimes more than one. Any cause that may promote health or vigor will have a decided effect on fertility. Good housing, sanitary conditions, good food, exercise and vigor all are essentials to fertility. Proper mating is also essential to fertility. An old, worn-out cockbird mated to old hens would be an undesirable mating where great fertility is desired. A young, undeveloped cockerel mated to immature pullets would also be undesirable.

Where one is breeding exhibition stock only, great fertility is not of so great moment as where one is catering to the market with broilers and roasters. In the latter case, every infertile egg means a direct loss. How to get the highest percentage of fertility thus becomes a problem of the greatest importance. Long experience has shown the best results attained by fall matings.

Before cool weather sets in the birds are mated, yarded and housed in quarters where they are expected to remain until after the following breeding season. We prefer a wind-tight house with an open south front, adjoining a scratching shed. A quart of whole wheat to each 12 birds in the morning, scattered in litter in the scratching pen. A warm mash of cracked oats and bran—about equal parts—with green stuff—scalded alfalfa leaves or meal added, or occasionally boiled potatoes chopped fine, or anything green attainable, for the noon feed. A quart of cracked corn in the litter at about 4 p. m. completes the daily menu, varied from day to day as much as possible. Sometimes a morning feed in the trough, or cracked oats only. Again a morning feed of whole barley.

Occasionally a morning feed of bran only—dry, of course—which is greatly relished. Sometimes a noon feed of cracked corn boiled soft and dried off with bran and fed warm, especially in cool or cold weather, is greatly relished. We like the effect of a handful of ground charcoal added to the mash two or three times a week. Fresh water, shell and grit, of course, are before the birds all the time. The item of grit we believe to be one of the utmost importance. We prefer screened pebbles of size anywhere between a grain of wheat and a grain of corn—the kind that may be found in any gravel deposit. A box of these pebbles is constantly within reach of the flock, and once or twice a week we like to mix a handful of pebbles with their trough feed in the morning. Try this and note the result.

We have read frequently that many breeders prefer to keep their birds from laying in the fall and winter in order that they may get fertile eggs during the hatching season. If this were essential, well and good; but is it? We believe not. During the fall months we feed our birds heavily daily with cut green bone to induce laying. When fairly well started to laying, we omit the green bone, for we know from experience it is not so conducive to high fertility as well-cooked lean meat, nor is rare meat so good as the cooked meat. Each breeder gets daily a slice of well-cooked lean meat good enough to tempt a hungry man—a slice as large as two fingers. Sometimes it is fried heart or liver, but generally what the butchers term "soup meat." It is boiled until thoroughly cooked and tender; the soup is drained off and mixed with the noon mash and the meat is fed directly after the mash.

We have had cockerels mated to hens, pullets mated to cock-birds and pullets mated to cockerels, and with this method of feeding we have been unable to detect any difference in the fertility of the eggs from the various pens. Several times we have had reports of high fertility. One man tested out only seven infertilities from 1140 Leghorn eggs; another got 92 chicks from 100 eggs. The Orpingtons, of course, showed less fertility, as might naturally be expected from so large a breed, but from our incubator we averaged nearly 90 per cent.

We have followed the above method of feeding and caring for the birds for many years and have never found any other method so sure of good results. It costs but little to try the method, and we know the results will be satisfactory. If your eggs in the past have not been satisfactorily fertile, try it.—Portland Oregonian.

PROFIT IN WATER FOWLS.

Water fowls are the greatest money-makers of any fowls grown on the farm, save turkeys, and we are absolutely sure they will give the turkeys a hot race for supremacy from a remunerative viewpoint for the reason you can raise so many more young ones than you can turkeys, and they are so much less liable to disease, says a breeder of ducks and geese. Turkeys are much more convenient to raise and are cleaner, making them more in favor with the majority of farmers, but when it comes to counting dollars in profit with the two great feathered American fowls we believe the goose will out-count the turkeys, although we have no data which we can refer to which would strengthen our claims, but close observation is a mighty good account book, however great the turkey proceeds are. There should be more water fowls grown on the average farm and poultry ranches throughout the country.

SOME DO'S AND DON'TS.

If possible keep beef scrap and dry wheat bran before the hens at all times, with plenty of oyster shells, grit, granulated bone and granulated charcoal. Feed either cabbage or mangel beets every day. Split the mangels in halves and drive a spike through them into a piece of plank and let the hens pick at them. Throw the cabbage on the floor; don't follow the old notion of hanging cabbage up from the floor two or three feet, so the hens will have to jump up to give them exercise. That kind of exercise is a positive injury to laying hens. Don't overfeed, but give the hens all they will eat up clean. Don't be afraid of getting them too fat; poor hens don't lay eggs in winter. Hens fed and managed right will be contented and happy and lay plenty of eggs during the winter months.

PREPARING GEESE FOR MARKET.

Geese should be grown to large size and then finished for the market in the shortest possible time. It is a good plan to shut them up in a limited enclosure and then feed them to the limit for about two weeks, selling them as soon as possible after this. In many markets the heavier a goose weighs the more it brings per pound, so it is an object to make them as heavy as possible.

"Not how much, but how good," is a good motto for the poultry raiser.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Iris.

As to the Iris recently inquired about Mr. Lobingier writes:

There are several distinct kinds of Iris and many species, varieties and hybrids. The German is an early spring blooming flag and seems to succeed everywhere either in open sunlight or shade. The most popular is the Japan—Iris Kaemferii. It is found in great variety of color and double and single; hardy everywhere and delights in good mellow soil in open sunlight. They are increased by division, and can readily be grown from seed. They do not flower until near midsummer, when the flowering of the common Iris is past, which makes them all the more desirable. —Q. A. L.

Curing Lemons.

Please give a method of curing lemons on a small scale; have about sixty trees for the local market.—Old Subscriber, Long Beach.

The principal factor in curing lemons is to keep at an even temperature as much as possible and prevent too great evaporation; also the formation of moisture on the surface of fruit. Lemons should be packed while yet green, though at this time of year, or later, it has been difficult to get them up to the full size before turning. The usual size is 2 5-16 or 2¼ inches in diameter. The tinner can twist ordinary heavy wire into a ring of this size cheaply which may be given to the picker so that he may keep in mind the proper size. After the fruit is stored in the warehouse, be sure that the ventilation is sufficient to keep free from excess moisture. Covering with tent cloth has been found most satisfactory, but even then they must be watched almost daily to note condition and prevent excess or dryness or moisture.

Durum Wheat.

Please advise me regarding the Durum wheat. And do you think it will be a fitting crop in this part of the country? It is a good wheat country. It is very warm and dry in the summer. I think the average rain is not far from 10 to 12 inches. Where may I secure the seed and at what price? Is the Durum Wheat a good milling wheat.—L. C. L., San Miguel, San Luis Obispo county.

This query was referred to Professor G. W. Shaw of the State Agricultural College, and he answers as follows:

"The Durum wheat, I think will be very well adapted to San Miguel. This wheat can be obtained of any seedsman in Kansas and the Dakotas. Probably the local miller would be able to secure seed for anyone, having it shipped with their importations from Kansas."

Measuring Water.

Will you give direction for measuring water in a stream?—Mrs. N., Nordhoff.

The answer to this question would require more space than is at command in this department. So we refer our subscribers to page 441 of issue of April 16, 1908. Cuts and tables are there given with full instruction for measuring either by box or wier in running stream. The tables there given give result in either miner's inches or cubic feet. This table is so valuable and called for so often it is possible that we will repeat it with the cuts and tables in a later issue.

Alfalfa.

Do you know if alfalfa will pay in the upper Ojai Valley if irrigated? I have 40 acres of deep, rich, alluvial soil. It lies almost level, with streams flowing at least 10 months in the year. How much water is required for alfalfa? When should it be sown and what method of cultivation?—Mrs. G. N., Nordhoff.

There is no reason why alfalfa should not do exceedingly well under the conditions which you have described. The only question would be as to whether you would be short of water during the later summer months, but if only a two months shortage prevails you probably would not lose all the field of alfalfa, though it is possible you might not secure as many crops as you would if you could irrigate up to the next season. It is also possible that you might develop additional water supply either by wells or further development in the mountains about the place. As to amount of water see article on irrigation page this issue.

Beans and Boxes.

Please tell me how to raise string beans in boxes. Then transplant when danger of frost is over.—Subscriber, Selma.

We presume there would be no occasion this late to plant the beans in boxes, as all danger of frost should be passed before Subscriber could use the process which some gardeners do of securing their very early beans.

The method, however, is very simple and consists of a cheap, paper box, some use old berry boxes lined with paper so constructed that once the seed is well started in the glass house, it is carried in flats to the field when the little boxes are taken out and then stripped off, which leaves the potted plant with its small quantity of dirt just ready to set into the ground. Use care in not breaking this ball of dirt, which is solid around the roots of the small plant. If properly handled these plants will keep on growing as if the seed had been planted in the field and much earlier results secured.

Guernsey Cattle.

Kindly advise who breeds Guernsey cattle?—C. E. B., Hollywood.

The largest breed herder of Guernsey in Southern California is the J. M. C. Marble Company with offices in the H. W. Hellman Building, Los Angeles.

Citrus Culture in Arizona.

Is the Yuma section suitable for commercial citrus culture? What is the range of temperature there? What degree of frost kills an orange or freezes it to the ground?—J. W. D., Aptos.

There is less commercial citrus culture at Yuma than in the Salt River Valley. However it is possible to grow oranges in that section. That is in sections as free from frost as possible. The trees do not seem to bear as heavily as in the nearer coast sections. However the earliness of the fruit gives increased price for the crop, which would probably even the shortage in production. The range in temperature at the government station at Yuma, that is the extremes, are 22 degrees and 118 degrees. As to the degree of frost which kills an orange tree, it depends much upon conditions, such as age of tree and amount of moisture in the atmosphere. For instance we have seen young trees killed at temperature little below 24 degrees. This was however after several days of hard, dry winds with almost no moisture in soil or atmosphere. Again we have seen a temperature of 22 following heavy rains with cloudy morning after the extreme cold where neither fruit nor trees were injured to any great extent.

Grape Fruit Stock for Oranges.

I have been thinking of planting grape fruit seed for stock on which to bud valencias. I have been told that they are very susceptible to gum disease. Is this true and would you consider orange seed better for stock? —R. C., Anaheim.

The grape fruit or pomelo is possibly more susceptible to gum disease than the sweet seedling. If your land is of the nature which would be troubled with gum disease, we would advise the securing of sour stock seed. The pomelo makes a strong growing tree and is preferred by some. If proper care is given to soil, it is possible that the disease could be controlled even with that stock.

Ruptured Blood Vessel.

I have a cow in good flesh giving fine flow of rich milk that some weeks ago developed a lump in one teat and since that time has given bloody milk out of it. Can you tell me the trouble and give directions for treatment Is milk from other teats suitable for use?—Mrs. J. E. N., Nordhoff.

The inflammation in these cases is local and the milk from the other teats not affected is normal and healthy. Rub the udder well with hot lard at least five minutes twice a day. I should use a milk tube to draw off the milk and avoid any strain on the part until the ruptured vessel has a chance to heal.—M. E. A.

The New California

A Small Empire Hitherto Neglected but Now Beginning to Attract the Attention It Deserves. Some of the "Whys and Wherefores."

Millions have visited California in the past, have stayed a week, a month or a year, and have returned to the East delighted with our climate, scenery, fruits, and show places, such as the missions, etc. They have exhausted several languages telling friends of the delights of spending a winter and money in California, holding up our state as the rich man's paradise. But when asked about the chances for the man either with moderate means or with means yet to get, the answer has invariably been the same: "It's no place to make money, and the worst possible place for a poor man. Make your money in the East, but spend it in California."

In expressing these sentiments they speak of the California of yesterday, not of the California of tomorrow. They did not know that the

NEW CALIFORNIA

in addition to having all the advantages of the old, has also the further advantage of being a "bread and butter" state. In this respect they are no more wrong than are hundreds of thousands of native Californians who today are not aware of the fact that there exists within their state an empire that in the next few years will become the talk of the nation, and one that up to one short year ago was practically unheard of outside the boundary of the state. But it is here nevertheless, and today thousands in the East are being consumed with a desire to visit this region and to make it their future home. There are thousands in the East who are making mental or actual preparation to come to the San Joaquin Valley, and the Land of Kerman in particular, to verify the glowing reports they are hearing of the opportunities here. Already hundreds have come and have secured the spot upon which they expect to spend remaining years, and where they expect to combine the certain making of money with pleasure of real living. Already the landscape is dotted with the temporary domicile of the new settler, where in the near future will arise the modern bungalow surrounded by semi-tropical fruits and rich alfalfa fields—comfort and wealth combined. The movement is on, and the "New California" is in the borning.

A SINGULAR CONDITION

That the richest agricultural portion of a well known state like California should remain in obscurity seems almost incredible, and many refuse to believe that all is not known about California that ever will or can be known. But there is a reason for this condition. California has been advertised as a winter resort purely, and as such has no equal in the nation. The railroads have worked along the lines of least resistance and have catered to tourist business entirely, offering extra inducements to easterners wishing to spend the winter here. Visitors have been congested in certain well known communities, and by the peculiar routing employed by transportation companies, tourists have either been whirled through the San Joaquin valley in the night or have been sent along the sea coast. But in either case they have come away without knowing aught about this wonderfully fertile valley and the possibilities which here abound, and which are now becoming known. The tourist business as it has been conducted in the past has congested people in certain communities, and in these localities productive lands have risen in value till the price has become almost prohibitive, at least to the man of moderate means, and there is no longer chance for remunerative investments. If further rise in land values in the so-called "older" communities is to come, it will come slowly and only then after a balance has been restored by populating the San Joaquin valley and after lands here have doubled several times in value. As it is, things are out of balance—lands sky high and scarce in one part of the state, and ridiculously low in another, and the latter the equal of the first, and generally conceded to be the superior by those who are competent to judge.

But portions of the San Joaquin Valley have been heard of, but the information has usually been thoroughly filtered before being passed to those who are looking for a location where it is possible to make money, and where the making of a living need give anyone no concern. For instance, Fresno county, in which the Kerman tract is located, has forced from the outside recognition as being the home of the raisin, the Smyrna fig, the olive and other semi-tropical fruits. Its wines have long since become famous. But while the county has been accorded these recognitions, somehow the public has been led to believe that it had some disadvantages not shared by other portions of the state. Just how these misrepresentations have gained currency is not material. The fact is that they are misrepresentations, and that the public is fast finding it out. People both east and west are learning that there is no more pleasant place to live in in the state, and that today there is no section that offers the advantages that the valley offers.

The Famous Kearney Boulevard, Extending 11 Miles East from the Kerman Tract

"THE LAST SHALL BE FIRST."

And so it comes that the "last shall be first," and that the section of the state destined to become the California of tomorrow, the real California, has been lying unnoticed by the hordes which in the past have swarmed over the state looking for a spot with the maximum of advantages and minimum of disadvantages. So it comes that today there is a greater chance for money making in farm lands than any community has offered in the past. So it comes that there yet remains a spot delightfully new where fortune, comfort, and contentment await the one who investigates it before it too has become congested with people, and values have gone into the thousands per acre. It is as yet a ground floor proposition, and all the profits incident to the rise that must come are yet to be taken, and will go to those who have the enterprise to secure their lands before the rush from the East forces values upwards.

But Fresno county is not all new, for within its borders are contained some of the richest colonies in the state, areas that have made themselves wealthy. A county that during 1907 raised products to the amount of over thirty-one million dollars is not a wilderness, neither is it an experiment. So while the Kerman colony is delightfully "new" it is a part of a county old enough to have astounded the outside with its wonderful agricultural richness.

This is not a land yet to be tried out. The experimenting has all been done and a reputation has been made for its products in the marts of the world. What Kerman lands, combined with Kings river water and Fresno county sunshine will do when mixed by man, is no problem, but a well established fact. Unlike many irrigated projects, some existing principally on paper—the future of the Kerman tract is a certainty. The pioneering days are long since over, and those who locate at Kerman can absolutely know what will result from their labors, for hundreds who have settled here in late years are already well on the way to opulence.

WHAT IT OFFERS

It offers the best water right in California, the same being abundant, appurtenant, perpetual and cheap, the maintenance tax being but 62½ cents per acre per year.

It offers a soil peculiarly fitted for the abundant production of all semi-tropical fruits, and pretty nearly offers a monopoly on the production of those specialties that require much sunshine and immunity from atmospheric moisture, such as raisins, sundried peaches and apricots, Smyrna figs, etc. The soil is deep, mellow and wonderfully rich, being easily worked . For the dairyman and alfalfa grower there is no country the equal of this.

It offers the advantages of a modern town, electric lighted, with sewerage, waterworks, public park, modern school house, splendid hotel accommodations, bank, etc. Kerman has telephones, and the best of railway and motor service, being located on the main line of the Southern Pacific between San Francisco and Los Angeles. There are no pioneering experiences to endure and no "new country" obstacles to overcome.

The prices of lands are as yet at bed rock, being from $110 to $150 per acre, including the water right. Terms are easy and so arranged that the settler can easily pay for his lands out of his crops after making the first payment. For further particulars either write to

CARNINE & STORGAARD, Kerman, Cal.

Cream too Ripe.

I shall be glad if you can tell me what is the matter with my butter. I have one cow and although I churn alternate days, the butter looks, smells and tastes as though two weeks old. All utensils are kept scrupuously clean, being scalded and rinsed before and after use.—F. D., San Gabriel.

Evidently the cream is too ripe when churned and should be retarded by holding it at a lower temperature. This may be secured in the absence of ice by making a jacket for the cream can closely with three or four thicknesses of cheese cloth. Place the can out of doors in a shady place and put a can of water on a stand so that a small amount will drip on the sacking and keep it wet. If this is a fresh cow, after she has been in milk a little longer the cream will not ripen as fast as it does at present.—M. E. S.

Japanese Iris.

Upon reuest of a Santa Cruz subscriber for information as to culture of Japanese Iris, we wrote to Mr. Henry A. Dreer, seed and bulb grower of Philadelphia, and he gives the following points: "If you refer to the cultivation of Japanese Iris, would state that our best success has been in giving these ordinary field culture in well-drained ground where, during severe dry weather, we are in position to irrigate. There are large quantities of these Japanese Iris sold in connection with other hardy perennial plants. As a cut bloom, although they are very handsome and deserve popularity, they are handled but very little. For cut flower purposes, flowers should be cut when the buds are just in condition to expand, when they will last in water for four or five days.

How to Sow Kafir Corn.

Please tell us about Kafir corn, how much to sow to the acre for cutting with the mower and feeding green to milk cows. How does it grow on alkali land? We have heard that in Kansas where they irrigate it was often cut same as alfalfa. Please state at what stage it is cut. —H. D. W., Santee.

Kafir corn sown in this way requires about 25 pounds of seed to the acre. We find, however, that it is more profitable to drill it in continuous rows three feet apart as it can then be cultivated after it is irrigated and a quicker second and third cutting secured. We, however, for this use prefer the saccharine sorghum as the early Amber rather than the more woody non-saccharine varieties. It should be cut before it heads and not below the first point. It will then sprout at once. If there is more than can be fed, cure it for winter hay. The first sowing can be made at once and a second sowing follow in two weeks. In this way one will come ahead of the other and give time to get the land ready. Both are fairly tolerant of alkali and will stand more than alfalfa. The cultivation after irrigation also will carry them along on land that they would not stand if merely soaked with water and the alkali to gather on the surface.—M. E. S.

Government Land.

We have a letter from a widow at Napa who wishes to file a widow's claim on government land, and she requests that any information which Cultivator Subscribers may have may be forwarded to her. If any reader may know of such land which may prove valuable, the information will be forwarded from this office.

Pilularis.

Where can I secure the seed of a Pilularis?—J. V., Fresno.

Any seedman advertising in the Cultivator we think can supply you.

Silver Skins.

Can you give me any information about the Silver Skin onions. Is it necessary to break them down, and how to do so, so they will not come up again? We have broke ours flat twice, but they come right up again and some have started to go to seed. —C. A. H., Burbank.

The breaking down of the onion tops will not prevent them from going to seed—or rather, it will not cause them to make good bulbs. The error is more deeply rooted in the minds of the average gardener that breaking down the tops will cause onions to bottom well. Either the seed has been from poor stock or the excessive wet winter is responsible for any failure to make good bulbs. I know of no remedy. Sometimes a crop that promises so poorly turns out pretty well and it is just possible, with continued fine weather, subscriber may find his loss inconsiderable.—Q. A. L.

Ditch Nuisance.

A water company has an open ditch situated on the side of the public road and about five or six feet from property line. The only entrance or approach to the several properties is over culverts about 16 or 18 feet long in front of each place. The ditch being an open one, and very much larger than necessary to convey the water ever run therein—there is a luxuriant growth of grass, weeds, etc., which, with the washing of sand from the main ditch, and sides of the lateral ditch itself, makes frequent cleanings necessary, which amounts to a considerable quantity each time, this is shoveled out of the ditch, and left there by the company and if not removed by some one, other than the company, will in time make a bank several feet high and wide. Quite like a field work, or rifle trench in time of war.

The company is willing to abate the nuisance if the property owners adjoining will pay 40 per cent of the cost to pipe the ditch.

This piling of weeds on sides of ditch prevents the adjoining owners from keeping their street in sightly condition, without removing the deposits, which is very annoying, expensive, or if left, unsightly. The ditch has been in use a good many years. Repeated efforts have been made to get the public authorities to take action. Nothing doing.

Has the company a legal right to shut out the property owners from their land, except the 16 or 18 feet culverts Has the company a right to maintain such a ditch to the constant annoyance and menace to the property owners, as well as that of the public?—Water Ditch.

The property owner has an action for damages against the company because of being shut out from the full use and enjoyment of his land by the ditch, unless he has acquiesced in the existing condition for such length of time as to be stopped from objecting.

If the company has not, by grant, or use for the required length of time, procured title to the easement, the owner has the right to remove the ditch.

The company's encroachments can be justified only to the extent of its easement; as to all beyond that its acts constitute a private nuisance, for which an action may be maintained. It is bound to keep the ditch in such a state that it will cause no encumbrance to the adjoining property owners beyond that warranted by the easement. The adjoining owner has in this, as in other cases of nuisance, the privilege of taking the remedy into his own hands.

If there is no grant to the company, its rights are measured by the manner in which it has used and maintained the ditch without objection for years past.—E. L. Payne.

When writing advertisers, mention Cultivator.

The L. M. Davenport Company have moved their offices back on North Los Angeles Street at No's 110-112. The many demands of their old customers were so great that they decided to move back on "Implement Row" where they carry a full line of samples. Their shipping is all done from their factory and warehouse. They have greatly increased their line and are in better condition to take care of their many customers than ever before. They also carry a full line of the Holt Combined Harvester extras.

The Limoneira Company at Santa Paula will make exhibit at the coming A-Y-P Exposition at Seattle.

ALL THAT IS CLAIMED.

Long Beach, Cal., March 5, 1909.
Mr. John Schilling, Jr.,
Agent Auto-Fedan Hay Press Co.,
Los Angeles, Cal.

Dear Sir:—I have used your press in all kinds of hay, and must say it beats any press I ever used. Have had experience with a good many different makes. I used your press in Kansas prairie hay, also in long barley grown in California. Have done fine work in both kinds. Am well satisfied with it as a safe, durable and speedy machine.

Yours truly,
FRED SEDGWICK,
Long Beach, Cal.

TWO LOVERS AN' LIZETTE

Who, me? in love, an' wid Lizette?
  You better b'lieve I ain't;
No sassy gal like dat could give
  Dis nigger heart-complaint.

If Gord don't love her more den I,
  Den all I got to say
Is, dat her soul's in danger sho',
  An' she had better pray!

It's her dat is in love wid me;
  An' I jes laughs an' tell her,
"De fruit dat draps d'out bein' shook
  Is sho' to be too meller!"

But all de same, you talks too much
  To suit me, 'bout Lizette;
Some gent'man's nigger gwine get hurt
  About dat same gal yet!
—Howard Weeden.

EARLY VICTORIAN.

"THAT is your last word?"

"Emphatically." His eyes avoided the pretty flushed face of his wife and swept the wide drawing-room with an apprising glance. "What more do you want?"

He threw his hands out with a ponderous gesture that somehow fitted his stolid British presence as finely as the light shrug of the shoulder fits the Frenchman, and his face hardened into obstinate lines.

But she said nothing in return.

Stung by her pregnant silence, he went on: "I'm a plain city man, with no pretensions! What was good enough in my father's time is good enough for me. I don't hold with the present ridiculous fashion in houses. It's simply an excuse for squandering money. My parents lived here and chose the furniture, and it's all good of its kind—Early Victorian, if you like, but solid and handsome—far better—." He checked himself with an effort under the sudden temptation to allude to the poverty from which he had rescued his bride but two years since, and went on hurriedly, with a heightened color: "It's no good, Iris, you'll have to make it do!"

But she guessed the trend of the sentence so clumsily suppressed, and her eyes narrowed with annoyance, as, following his gaze, they rested on a portrait on the farther wall, that of a portly lady in a lavender silk dress, with smoothly parted hair drawn over her eyes and bearing the insignia of her office, a massive silver chatelaine, which the artist had minutely reproduced in detail, perhaps in utter hopelessness over the hard middleclass face.

Yet, for all that, a certain look of pride crept into her son's eyes as he gazed up at the—so-called!—"work of art."

"If you follow her" he said with a nod, "you won't go far wrong! And now I must be off."

With a third of the money she now could claim what a life could have been hers in the little flat by the busy gate—what treasures of art, what feasts of intellect! For now she had the means, she lacked the environment.

She thought with a shudder of the formal "dinners" their present style of entertainment invariably took, and, although she loved her husband, she rebelled in the depths of her Bohemian heart at the life she had voluntarily and even thankfully stepped into.

But in those days it had meant comfort not only for herself, but for the practically dying mother, and the peaceful assurance to the latter of the safety of her child after she herself had passed through the dark valley.

It had been all for the best.

She pulled herself together with an effort of courage as her mind ran back to her mother's death.

After the first shock of her grief she had given herself up to improving the gloomy Bloomsbury mansion; picking up quaint, inexpensive old chairs, discarding the heavier ones, adding bright, artistic chintzes, and consigning the "impossible" curtains to the depths of the lumber room.

All so quietly and unobstrusively that her husband from his pinnacle on the rock of conservatism had hardly realized the change until this eventful day.

Then, through the stupidity of a shopman, a fine old dresser had arrived at the precise moment when Cecil Armstrong was leaving for a week's fishing in the north. Explanations had been precipitated, and the veto had gone forth.

Anyhow, she had a treasure of a cook—that weapon in the hands of a wife!—and she wondered with a little smile of amusement, what the prim figure with the chatelaine would say to the modern cuisine.

"Extravagant kickshaws, I expect," she said to herself, and, as if in answer to her thought, an idea flashed into her mind, a comedy of revenge against that debatable "family taste," so complete and alluring that her laugh rang out in the somber room.

It was a pouring wet evening when Cecil Armstrong returned to town. The weather for the last few days had been unsettled, the fishing bad, and the first novelty of "roughing it" had given way to steadily growing disgust at the discomfort of perpetually wet clothes and smoky fires.

He leaned back in the hansom and gave a sigh of relief as, crossing Oxford street, they turned up into Bloomsbury, and he pictured to himself the discret welcome of Robert, the comfort of the brightly lit house, and the well-cooked dinner with his pretty young wife.

She was standing just outside the drawing-room door—not in the pretty evening dress he had somehow anticipated, but very straight and slim in a plain gray silk, devoid of ornament, and from her waist there hung his mother's chatelaine.

Unobservant by nature, he yet felt there was something instinctively wrong about her hair, and, although she greeted him affectionately, a little chill crept into the subtle sense of homecoming.

All the hundred-and-one little improvements—the scattered embroideries and masses of plants and carelessly arranged flowers—were missing. The old heavily framed prints were back on the dull gray walls, and, albeit the night was chilly, no fire burned in the gate, where a painted screen was balanced, with an impossible waterfall that threatened to deluge the steel fender and pour out over the enormous bear-skin rug.

He enjoyed his Scotch broth thoroughly, but when it was followed by a massive joint of cold sirloin, placed, not on the carving table, but, in all its majesty, under his very nose, hiding his disappointment with a heroic

Bohn-Syphon Refrigerators

THE BOHN dry air syphon "Porcelain" lined refrigerators are the only refrigerators we have ever seen that we regarded safe and good enough for our endorsement and broad guarantee.

The BOHN-SYPHON is the refrigerator that is advertised so extensively in the leading high-grade national periodicals.

The BOHN system of cold storage is used by

90 Per Cent of the Freight and Express Refrigerator Cars

in the United States and exclusively on all Pullman dining and buffet cars.

The BOHN-SYPHON refrigerator, designed for use in the home, is a cold storage plant in miniature, not merely a place to put ice. The BOHN-SYPHON is the only refrigerator, so far as we know, of which the manufacturers specify the temperature at which the food chamber is kept.

The manufacturers claim for this refrigerator more economy in the consumption of ice, a better circulation of air, a more perfect drainage, the absence of all odors, a more sanitary and hence a safer receptacle for food.

Of course, the BOHN-SYPHON refrigerator costs more than the ordinary ice box—that is, the first investment is more, but ultimately the BOHN-SYPHON should pay for itself in the saving of ice, in the preserving of foods and the guarding of the health of the family. You really can not discard one of the old style, unsatisfactory ice boxes too soon.

Whether you want to buy now or not, it would pay you to investigate carefully the merits of the BOHN-SYPHON. It is sold, like all our goods, under a positive guarantee of satisfaction or your money back.

Call or write for catalogue, it will give you much interesting and valuable information on economical refrigeration and the proper preservation of food and health.

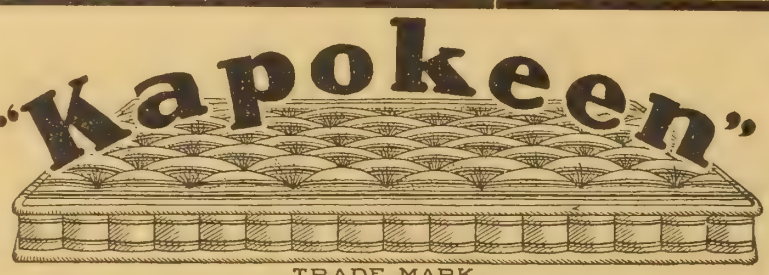
"Kapokeen"



TRADE MARK

The Mattress of Quality

In introducing our Kapokeen Mattress to the readers of The Cultivator, we are taking the first steps toward establishing a National reputation and market for an article, which, on account of its many advantages, has gained a pre-eminent position in its own vicinity.

"Kapokeen" is made from the Kapok or silk floss obtained from the bean of the Eriodendren tree, grown on the island of Java. It is prepared by our own patented process, which removes every particle of seed and preserves in full the resiliency of the natural fibre.

The mattress is made in our own factory where every precaution has been taken to insure absolutely hygienic conditions, by skilled workmen using only the best quality of materials throughout.

NOTE THESE POINTS.

Kapokeen can be "made over" in exactly the same manner as hair.

Kapokeen is sun dried, sun cured, and free from chemicals or other foreign substances.

Kapokeen, no matter how long it has been in use, by being placed for two hours in the sun, will expand and become as resilient as a new mattress.

Price No. 1 Kapokeen Mattress, 4-4 size, 5 1-2 inch box, Imperial edge satin ticking **$15.00**

Three-Quarter Size, $12.50 Single,$10.50

Kapokeen Mattreses are made only by

John Breuner Co

A postal will bring you a little booklet describing this mattress

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to theeyes.

Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. ABSOLUTELY SAFE under all conditions. Lighted and extinguished like gas. Burned HIGH or LOW like GAS without a trace of odor. And a BRILLIANT, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 32 hours on 3 quarts of oil.

P. F. Ross & Co.

268 Market St. San Francisco, Cal.

When writing advertisers, mention Cultivator.

attempt, he suggested an explanation himself.

"Something gone wrong in the kitchen, I suppose, my dear?"

"Wrong " said his wife, innocently. "I hope not! It looked an excellent joint. I saw it cut myself." There was pride in her steady voice, but she dropped her eyes before his astonished look, fearful of the mischievous spark she feared might be there.

He looked across at her with sudden anxiety.

"It's all right," he said, hastily. "I'm not a bit hungry, that's all. We've had such rotten weather lately. 'Im glad to be back again—"he cleared his throat—"very glad."

His wife got up with a sudden twinge of compunction and poured him out a glass of port. "That will do you good," she said, gently; "it's the old bin."

He put his arm about her and she bent down to him.

"You've done your hair differently?" he suggested, with a puzzled glance.

She put up her hand and stroked back a rebellious strand, that would curl against her will.

"It's neater, isn't it?" she said. I knew you'd be pleased."

She picked a little bit of fluff off his coat collar and went on, softly: "I'm going to try, Cecil—after what you said—you remember?—to take life more seriously, and try to model myself and the house, and, in fact, everything, on the old regime you so approve of."

A shade of anxiety stole across his strong, open face, as he listened to her.

"No more foreign ways—no more French food—" a vertical line came between his eyes, but she went on with increasing fervor—"no more money squandered on dress," she smoothed out the stiff folds of her silk gown primly, "and no foolish alterations in the house."

What could he do but murmur incoherently his approval of her conduct as he kissed her pretty face so near his own?

"I believe it's a joke," he said, doubtfully, as he poured himself out another glass of port, but when he joined her upstairs, in the melancholy looking drawing-room, his heart sank again.

"Almost cold enough for a fire, isn't it?"

"In May!" Her voice showed marked disapproval, as he moved about restlessly on the stiff sofa, innocent of cushions.

Just as he was turning to go, with a heavy gesture of annoyance, she stopped him with upraised hand, as though fired by a fresh idea.

"If you would care, Cecil," she hesitated, purposely, "there's my den—as I call it; and a fire—you know how chilly I am!—and we could sit there together."

Before he could reply she ran lightly past him up the stairs.

As he joined her, openly grumbling, on the landing above, she threw wide the door of a room hitherto unused, and switched on the light.

He gave an involuntary exclamation as his eyes fell on the bright log fire, flanked by two deep chintz-covered chairs, adding its sweet scent of pine wood to that of the massed flowers scattered in profusion in the cozy room.

She drew forward one of the comfortable chairs with the pride of ownership.

"Sit down, darling, and light up—here are matches," and proceeded to make coffee.

Once she turned and tucked a soft cushion under his head as he lay back comfortably in silence, drinking in the old familiar artistic atmosphere—that instinctive touch of clever fingers now banished from the rooms below.

And as he watched her, the only incongruous note; in her formal Victorian dress, her beautiful hair deformed by its very neatness, her individuality tampered with, slowly the lesson played its intended part.

So that, when she handed him his coffee and his eyes met hers:

"I give in," he said, under his breath, "and for heaven's sake go and get into a comfy tea-gown, old girl—and be yourself again, and, look here—" his voice rose almost gayly as he saw the happiness shining in her face—"I didn't mean it—I'll give you carte blanche in future; do what you like, only—no more cheese and cold beef—eh?"

And a kiss wiped out the last sting of the Early Victorian comedy.—Exchange.

About the House

TO WASH A PRINT DRESS.

THE price paid for the pretty cotton and gingham fabric in no guarantee as regards durability of color for often those colors which look most promising are the ones which vanish quickest.

Colored print goods will be freshened if the color is set before washing the first time and this may be done by soaking the garment in a strong solution of salt and water for an hour before washing, though some colors require a little different treatment. A light shade of pink or blue may be set with salt water in which a little alum is dissolved and there is nothing better than oxgall for setting the different shades of purple, lilac and light reds. Pretty gingham and other cotton waists and dresses can be washed so that they will lose none of their beauty if it is done in the right way and nice colored garments should be washed by themselves and not hurried through with the weekly washing.

There is nothing better for keeping the color in nice cotton fabrics than warm soft water in which enough pearline has been stirred to make a good lather then the garment must be washed quickly through this suds and rinsed through two waters; turned wrong side out and hung in a shady place to dry.

When perfectly dry roll up for an hour after sprinkling evenly with warm water, then iron on the wrong side with hot irons. The starch should be strained to make it as smooth as possible and to avoid starch spots showing on the goods, and no colored goods should be subjected to sunshine while wet, nor be left in the wind after drying.

Fruit stains can be removed from colored fabrics by soaking the stained portion in turpentine and some other remedies are cream of tartar and water for grass stains equal parts of ammonia and turpentine for paint, lard for tar or wheel grease; and spirits of salt may be used on colored as well as white cloth for removing iron rust.—M. A. Y.

He.—I've money to burn.
She.—Then I'm your match.

DISPOSAL OF WASTES.

The proper disposal of waste products presents a difficult problem. Do not throw old bottles, tin cans, broken vases, or dishes near the house, as they become filled with water and after a rain form a good breeding place for mosquitoes. There should be a metal pail in or near the kitchen and all the garbage should be put into this. Empty it every morning and evening and wash it out, using boiling water and soap. Use an old broom for washing the pail. If garbage or refuse pails are kept clean, there is no odor. Remember that a wooden barrel is not a good thing to use for garbage because the liquid runs through. The removal of the garbage is quite a difficult problem. In small towns it is a good idea to burn everything as far as possible. In a small family all the garbage may be burned in the kitchen range, or in the furnace, if you have one. Use all the coal ashes to fill holes in the road or to make walks.

The quick removal of all waste products is the first law of sanitation. Sanitarians know that typhoid fever need not exist. It is the result of a little germ that enters the body in food and drink, grows very quickly in the small intestines, and is then thrown off again in the excreta. Be very careful not to throw these discharges on the ground, as they soak through the earth and contaminate the well water. Select a different place every day to throw the slop water or the dish water. Many a case of sickness comes from unwashed floors, unclean pails, deplorable outbuildings. There are so many little things that go to make good sanitary conditions. Fire is the best disinfectant we have, so burn the wastes as quickly as possible.—Mary F. Rausch.

BUTTERMILK.

Buttermilk as a remedial agent cannot be praised too highly. The lactic acid, the sour of the buttermilk, attacks and dissolves every sort of earthy deposit in the blood-vessels. Thus it keeps the veins and arteries so supple and free running there can be no clogging up; hence no deposit of irritating calcareous matter around the joints, nor of poisonous waste in the muscles. It is the stiffening and harrowing of the blood-vessels which bring on senile decay. Buttermilk is likely to postpone it ten or twenty years, if freely drunk. A quart a day should be the minimum, the maximum according to taste and opportunity. Inasmuch as gouty difficulties arise from sluggish excretion, buttermilk is a blessing to all gouty subjects. It gently stimulates all the excretories—liver, skin and kidneys. It also tones the stomach and furnishes it the material from which to make rich, red, healthy blood. If troubled with gout, avoid meat, sweets, pastry, wines, spices, hot rolls, bread of all sorts and everything belonging to the tribe of ferments. Eggs, game, fresh fruit, vegetables, especally salads, may be eaten with impunity. If anyone has a creaky joint or a swollen and aching one, he should drink all the buttermilk he can relish whenever and wherever he can, but it should be fresh-churned and wholesome.

Little Barbara, on seeing a dish of quivering lemon jelly placed upon the table, exclaimed, "O mamma, see how nervous that jelly is!"—Youth's Companion.

THE TROUBLE.

Och, why should I think av that shlip av a gurl,
Av that soft little whisp av a thing?
Och, why should she throuble a bullock like me,
Who's thraveled and taken me fling?

Aroo, and a pea is a mite av a thing,
Tho' shut in your shoe and 'twill shmart!
But a mite av a gurl will throuble ye more
When she's tight on the tip av your heart!

—Arthur Stringer.

THE ONLY AD HE EVER HAD.

There was a man in our town
Who was so wondrous wise;
He thought a business he could run
And never advertise.

Take heed and learn the moral
Of this sad and mournful tale,
For the only ad he ever had
Was: "Closed for Sheriff's sale."

—The Wilclarco.

LOST HOPE.

Alas for the man who never sees
The stars shine through his cypress trees!
Who, hopeless, lays his dead away,
Nor looks to see the breaking day
Across the mournful marbles play!

Who hath not learned, in hours of faith,
The truth to flesh and sense unknown,
That life is ever lord of death,
And love can never lose its own.

—John Greenleaf Whittier.

HAD PREDICTED GREATNESS.

"How do you like running a street car?"

"It ain't so bad," replied the boy graduate. "However——"

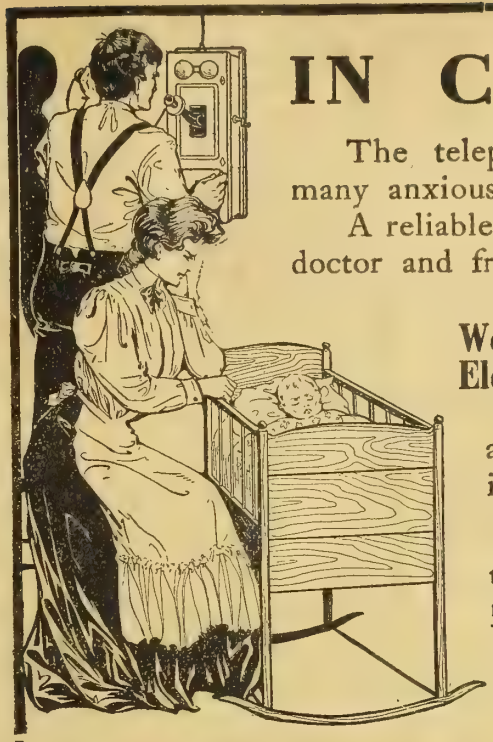
"Yes?"

"I don't think much of our class prophet."—Louisville Courier-Journal.

Employer—The increase in the cost of meat makes a lot of difference in my living expenses! Don't you find it so?

Clerk—No, sir; my salary is so small that I've bought no meat for several years!

Employer—You're fortunate! You won't mind it then if on account of the high price of meat I reduce your salary a little.—Simplicissimus.



IN CASE OF ILLNESS

The telephone is a friend in need. It will save you many anxious moments and possibly **the life of a loved one.**

A reliable telephone places you in instant touch with your doctor and friends without taking you from the "sick room."

Western Electric Rural Telephones

are of proven reliability. They will not fail you in emergency. **Think over the small cost.**

All of the material needed to build the very best rural telephone line will cost you and your neighbors only about as much as two or three sheep. With our Free Bulletins before him a boy can install and operate the system.

Cut out this advertisement, write your name and address on the margin and mail to-day to our nearest office, so that our **Free Bulletin No. 71** which describes the entire plan in detail, may be sent you immediately.

WESTERN ELECTRIC COMPANY

The world's oldest and largest telephone manufacturer. There are over **4,000,000 Western Electric Telephones** in use in the United States to-day.

Mayer Leading Lady

THE CORRECT SHOE FOR STYLE, EASE AND GOOD WEAR

You could never hope to buy a more stylish or serviceable shoe than the "Leading Lady." It is right up-to-date in appearance and fits the foot perfectly from the very first. Besides being stylish and comfortable, the

Leading Lady

wears much longer than most shoes. It is so well made that it lasts twice as long as the average shoe, and will retain its shape to the end.

Why buy inferior shoes when, with the same money, you can get the "Leading Lady?" **Your dealer will supply you; if not, write to us.**

Look for the Mayer Trade Mark on the sole.

***FREE*—If you will send us the name of a dealer who *does not* handle Leading Lady Shoes, we will send you free, postpaid, a beautiful picture of Martha Washington, size 15x20.**

We also make Honorbilt Shoes, Martha Washington Comfort Shoes, Yerma Cushion Shoes and Special Merit School Shoes.

MILWAUKEE Mayer CUSTOM MADE

Hay.

Arrivals for the past six days have been 2560 tons, being an increase over the last week's arrivals. Although quite a bit more has come in, our market continues strong, and the demand has practically equalled the supply day by day. As stated in our last report, quite a feature of our market now is the appearance of medium and poorer grades, which are being baled up out of the stacks and out of barns, as the farmers realize that they will not need it by reason of the approaching crop. This grade of hay, however, is not doing well upon our market. Quite a bit of it has bunched in here lately, and sells at very much under the current quoted rates for sound No. 1 hay of better grade coming out of the warehouses. All No. 1 grades sell readily at high prices, but the medium qualities, and especially those that are touched a little with damage, drag very slowly.

Reports from all over the state are to the effect that the season will probably be late, although the excellent weather of the past week has stimulated things wonderfully. Roads are drying, and conditions are such that we should have quite heavy arrivals for the next few weeks. The interior demand is reduced, however, as all available stock is turned out where pasture is accessible, and in many cases the green hay is being cut to save the enormous expense incidental to the present high range of prices.

Alfalfa is becoming weak, as the season is shortening, and should sell at quite a bit lower prices in the immediate future. Straw is in light supply, and sells at previous quotations.

Citrus Market

LOS ANGELES, April 14, 1909.

The heavy shipments of oranges of the last two or three weeks have been somewhat in excess of the keenest demand and have resultd in a slight easing of the market. It can not be said that the prices have been cut materially but some slight concessions have been necessary in order to unload the large stocks in some markets. Slight slowing up of shipments have been called for and in fact will be forced from this time on because of Orange county and some other sections having practically cleaned up on navels. This will call for a material shrinkage to meet the slighter demand which will be occasioned by the small fruits which will enter the Eastern markets soon.

Lemons show no material change other than, if anything, the market is stronger than a week ago. The demand is good and gives promise of continuation, or if anything growing better as the season advances.

Shipments.

Shipments of oranges to date since November 1, aggregate 15,378; lemons

Disks Merely An Excuse

TRADE Sharples MARK 29 Yrs

Properly built dairy cream separators need neither disks nor other contraptions inside the bowl. **This is absolutely proven by the fact that the world famous Sharples Dairy Tubular Cream Separators are built without such bowl contraptions and yet skim two to ten times cleaner, skim faster, run smoother, turn easier and wear longer than any disk or other style of separator made by any of our competitors.**

Why the Other Fellows Use Disks

Tubulars are entirely different from all other separators. **Tubular construction is the only mechanically and scientifically correct method of separator building.** All other separators are still built in the old time, incorrect "bucket bowl" way. They have short, squatty "bucket bowls," set above their bearings and fed through the top. "Bucket bowls" are practically useless without disks or inside contraptions. Other makers can't build Tubulars, because our patents prevent them. So they stick to the old time way—use disks or other bowl contraptions because their machines are no good at all without them—and offer them to you as an excuse for buying their antiquated, complicated, inferior machines.

Sharples Dairy Tubular

We Don't Think You Want Them

We don't believe you want a work making, uncleanable, butter tainting, expense creating "bucket bowl," filled with disks or other contraptions. If you don't, then get a Tubular. But if you do—remember that "bucket bowls" are all about alike—all in the same class—as is confessed by the maker of the "original" disk filled separator. This maker admits that a catalogue house has been building a disk separator, like his, for a number of years and he now advertises a patent infringement suit against this catalogue house machine and asks the Court to make the catalogue house stop. The real trouble with our disky friend is that the farmers have learned what he now admits—that anybody can build disk separators, and build them cheap, and that the catalogue house separator is the same as the old disk separator. Farmers are wise enough to know that any man or woman who will put up with the inconvenience and expense of a disk separator had better buy it as cheap as possible, then when they throw it away they haven't lost so much. Several new disk separators are more modern and satisfactory than the much advertised "old original" and sell for half.

If you want your money's worth—want your separator to last a life time—don't get any disk machine—get a Sharples Tubular. Most farmers are getting Tubulars. Write for catalogue No. 260.

WILLIAMS' GOOSE-NECK CULTIVATOR

Patent applied for
ARNOTT & CO., General Distributers,
112 So. Los Angeles St., Los Angeles, Cal.

Especially adapted for citrus orchards. Sizes 7 to 14 ft. Lightest draft. Write today

The following is a sample of the unsolicited testimonials received regarding the Williams Goose-Neck Cultivator:

Merle, San Diego County, Cal., March 25, 1909.

Arnott & Company,
Los Angeles, California.

Dear Sirs:—You may recall that I recently purchased one of your Williams Goose-Neck Cultivators. I wish to say that I am exceedingly well pleased with it. In fact, as I told Mr. Jones, your representative in Oceanside, I would not take $500.00 for it if I could not get another. This is not an exaggerated statement, I mean it literally. In this section we do not have irrigation and everything depends on proper cultivation, so that good tools are very important. There are three points in which the Williams Goose-Neck Cultivator surpasses all other cultivators which I have seen, viz:

First. The draft is very light. My two horses weigh 900 lbs. each and they have no difficulty in drawing the 7 ft. cultivator.

Second. The Williams Goose-Neck Cultivator stirs the soil well without exposing the subsurface, thus preventing the escape of moisture.

Third. The cultivator being of low construction, one can cultivate under the trees as easily as harrow.

I was showing my cultivator to a neighbor the other day and had him take it home to try it. The use of it for half an hour so thoroughly convinced him of the merits of the tool that he has, through Mr. Jones of Oceanside, given you an order for one-half dozen cultivators.

Messrs. Williams & Son of Orange certainly deserve great credit for inventing the Goose-Neck Cultivator.

Sincerely yours

LOUIS C. LUHR.

Eat Raisins on Raisin Day---April 30

If You Don't Know How to Eat Them See Rocipes on Household Page This Issne. Also Some Interesting Facts Below on the Raisin Industry

EAT RAISINS is the slogan, all over the United States for next Friday, April 30; eat them not because they are a luxury, because they taste good, nor even because the Raisin Committee, which represents the grower, asks you to, but because they are nourishing food. In the leaflet sent out by the committee is the following quotation from a Department of Agriculture bulletin:

One pound of California raisins represents a food value equal to each of the following:

Six pounds of apples.

Five pounds of bananas.

Four and one-fourth pounds of potatoes.

One pound of bread.

Four pounds of milk.

Four and three-fourths pounds of fish (edible portion.) Two pounds of eggs.

One and one-third pounds of beef.

An important medicinal value of raisins is in their laxative effect.

In the same leaflet is the following statement:

"The truth is not commonly known that raisins are a food of the highest quality—50 per cent more nourishing than meat and far more healthful. Raisins are indeed the greatest health food ever produced, but while used merely as a sweetmeat, a luxury, their real value has remained unknown.

"The sugar of the grape, matured and perfected in the raisin is, by scientific analysis and experience, superior to all other. It is required by the human system in moderate quantities, especially by children. For them, as for the adult, raisins are far more healthful than any form of confectionery.

"The well-grown and well-cured California raisin is the most delicious and healthful food that a bountiful Providence has bestowed upon mankind. It should be found upon every table daily in liberal quantities."

This advertising campaign should lead to vastly greater consumption and reduce the 20,000-ton holdover crop yet in California growers' hands, possibly clear the field so as to give the next crop a fair chance when it is marketed next fall.

In this connection a few figures as to the raisin production of the world may be of value. The following is from facts gathered by Mr. George Robertson of Fresno:

Raisin Crop of the World in 1908.

Country.	Pounds.
Spain, raisins	52,896,000
Sultanas, (Smyrna, Asia Minor)	116,480,000
Sultanas, Greek	6,720,000
Commonwealth of Australia—	
Victoria, raisins	10,990,224
Victoria, Sultanas	3,167,360
South Australia, raisins	1,805,776
New South Wales, raisins	100,512
South Africa, (Cape Colony)	2,000,000
Total foreign raisins	194,060,272
California raisins	100,000,000
Total	294,060,272

In addition to this, two hundred and ninety million pounds of raisins and Sultanas, there must be added:

Currants.

Country.	Pounds.
Greece	369,600,000
South Australia	2,607,472
Victoria	1,313,760
Total currants	373,521,232

The acreage in vines of all kinds is increasing in all parts of Australia, and in a few more years Australian growers will probably be able to supply more than enough for their home consumption, both of raisins and wine. If any growers

(Continued on Page 472.)

Can More Money Be Secured for Prunes?

A Look at the Prune Situation, with Extracts from the Report of the Committee of Fifty

THE Prune growers of Santa Clara Valley are swinging into line with the co-operative fruit growers of the state. At the meeting held in San Jose some time since the determination to co-operate was almost unanimous, and the good work continues.

At that meeting Mr. J. O. Hayes presented the report of the Committee of Fifty. Mr. Hayes spoke of the former five cent price which even in face of two consecutive years of short crops has gone down till the grower is compelled to accept two cents or less.

The report then continues:

"Something must be wrong with the prune business or present conditions would not be. To find these wrong conditions and their remedy the Committee of Fifty was called together. It has thoughtfully considered existing conditions and means for correcting them, and at its last meeting unanimously agreed upon a plan that will, it is believed, bring the prune business to a stable and prosperous condition. This plan we are about to present to you.

Cause of Trouble.

"Before a remedy can be successfully applied the cause of the trouble to be corrected must be found. The Committee of Fifty therefore first sought to find the cause of the existing prune troubles. We finally concluded that lack of consumption was the primary cause. There are many wrong conditions that have contributed to produce this cause and these have been fully considered. Among these may be mentioned the late financial panic, now happily past, though many of its effects are still with us; defective and improperly packed fruit, which has turned many customers away from prunes; bad methods of marketing the fruit which have resulted in a constantly declining price that has brought loss to nearly everyone who has handled prunes and disgusted dealers almost to the extent of causing them to refuse to handle prunes.

"All these conditions and others have been considered and we have concluded that as growers we must deal with these conditions as business men. It is useless for us to rail at the packers, brokers, wholesalers and retailers. All these men are human and they will act as their interests seem to them to require, without reference to what we say about them. The prunes are ours. If we have not interest enough in our product to see that it is properly handled and marketed we need not expect others to do it for us and we have only ourselves to blame if we find our market destroyed and our product of little value.

Must Do Two Things.

"Two things we must do if we are to make prune raising a permanently profitable business. We must have the prunes properly cured and packed for shipment and then we must see that they are eaten. It is a comparatively easy matter to correct any wrong curing or packing conditions that may exist. The all-important thing with us, as growers, is to have our prunes eaten If the consumer were buying and eating our prunes all the troubles that have followed the prune from the box to the retailers' hands would disappear. The trouble with the prune market is to be found primarily in the fact that the prune has not been eaten. If the consumer were eating prunes he would be buying them from the grocer. If the grocer were selling to the consumer he would be ordering from his wholesaler. If the wholesaler were receiving orders for prunes he would buy prunes to fill his orders and if the wholesaler were buying from the packer, the packer would be chasing the grower to buy prunes to ship to the wholesaler, and the grower and those who handle prunes would soon forget their troubles and all would make money and everyone who handled prunes would praise them instead of ridiculing them.

How to Get Prunes Eaten?

"The important question to us growers is, therefore, how can we get our prunes eaten? Assuming that our prunes are properly prepared for shipment to the trade (and we must see that this is done) we must address ourselves to two things. We must see that our prunes are sold to the consumer at a reasonable price and that the consumer is made to know the desirable quality of the prune and how to prepare it to be eaten and that he is induced to buy it. If this can be accomplished you will all agree that our troubles as prunegrowers will be over. Can we induce the consumer to buy prunes and eat them? We can. How?

"First—Dry them and pack them properly so that they will be in attractive condition and not rotten when offered to the consumer.

"Second—Print recipe books telling the cook

With the Citrus Growers

REFRIGERATION CAR.

MUCH speculation has been aroused by the appearance of a car of new design which has occupied a sidetrack north of the plant of the National Ice Company for the past few days. This is the first experimental refrigeration plant of the Department of Agriculture and promises to be a most important factor in solving one of the greatest problems in the shipment of citrus fruits—precooling of fruit before shipment.

Since its arrival here the refrigeration car has been gotten in condition for making precooling tests. Water has been piped to the car from the National Ice Company's factory and the car has been placed where it can conveniently be connected with cars that have been loaded for shipment.

Blasts of cold air, driven into the loaded car through a 24-inch pipe from the refrigeration plant will, it is believed, cool the fruit so thoroughly that the car can cross the continent with its initial icing. The car was built to furnish refrigeration for the government's experimental work in any part of the United States, where investigations may be in progress. It can be attached to any building or loaded car along the sidetrack. Data will be thus obtained at the end of the season, showing what effect the precooling has on fruit which has been cooled down to the different degrees of temperature, and the time required to complete the precooling process with the different volumes of air passing through it.

Exact engineering data will be obtained on questions of refrigeration of fruit before shipping. The work has been hampered heretofore by lack of refrigeration facilities, and it was decided to start the experiments in California, because of the hearty co-operation obtained from all interests benefitted here.

Experimental work will be conducted at the close of the orange season in Southern California in deciduous fruits in Northern California. Later the car will be taken east and experiments will be conducted in the precooling of peaches and vegetables.

The refrigerator car was designed, all the details worked out and its building and equipment supervised by S. J. Dennis, expert in refrigeration in the fruit transportation and storage investigations of the Bureau of Plant Industry, Department of Agriculture. Its chief purpose is to secure refrigeration for the government experiments at such points in the country where adequate refrigeration cannot now be secured. A temperature of 16 degrees has been obtained in the coilroom in experimental runs.

This movable plant is something entirely new in the refrigerating business. One-half of the car contains the machinery while the other half is an insulated coil-room containing about 5200 feet of 1¼-inch extra heavy continuous welded ammonia coils arranged in eight coils, each coil complete with separate ammonia expansion valves, and separate ammonia stop valves. In the other half of the car the machinery is located. There is a 35-H.P. kerosene oil engine for the source of power; this engine by various belts and countershafts drives a 12-ton ice machine, a 2 K. W. generator for lighting and power, a 45-inch blower for blowing the air to be cooled over the coils, a centrifugal brine pump and a motor-driven triple pump.

This room also contains a 42-inch double pipe ammonia condenser, two large liquid ammonia receivers, an oil intercepter for the ammonia, water storage tanks, speed changing countershaft, and the complete piping and fittings for kerosene, water, ammonia and oil lines.

An Orange Grove in Sanger.

This plant is installed in a space practically 20 feet long by 7 feet wide and 6 feet 6 inches high, so it can be readily understood the difficulties to be encountered in undertaking to place such a large amount of apparatus in such a small space.

As a means of obtaining data on the refrigerator supply of the car plant a large calibrated ammonia reservoir has been fitted up in the car for measuring the ammonia circulated in the car. Provision also is made for weighing-tanks to weigh the ammonia in case tests of that sort are considered necessary.

Refrigerating men will realize that it requires a rather compact arrangement in order to put a complete 12-ton plant, including a small electrical plant, in one-half an ordinary box-car, cooling coils being arranged in the other half of the car. The cooling room is heavily insulated so as to stand a high temperature without undue loss of refrigeration.

The car is built very strongly to stand the tests and to carry the heavy machinery and weighs 60,000 pounds. A stiff platform and extra trusses provide for the machinery.—Riverside Press.

ATTACKING CO-OPERATION.

The effort of the Florida fruit growers to organize and co-operate in the marketing of oranges has called forth all kinds of attacks on the co-operative plan. Note the following from a recent Florida Produce News, an argument which was probably picked from some of the attacks made on the California Fruit Growers Exchange a few years ago when its plan had not been so fully demonstrated as it is now.

"Let us sell every car for cash California, at a home auction. But auction or otherwise, let it be for spot cash. This would close one-half of our too numerous packing houses, would reduce charges to a legitimate figure, would dispense with every unnecessary man Jack now living off the grower, would materially add to our net returns, would bring the buyer and grower in direct contact, would compel enforcement of Mr. Powell's excellent suggestions, as the packer who failed to do good work would be spotted at once, as a car packed today would sell tomorrow."

Fortunately the California Exchange member doesn't need to "spot" the packer. That was what he used to do and he gradually learned that his time was spent in "spotting" and he got mighty little comfort—or money—out of the "spotted" packer.

The present plan is very acceptable to the average California grower, at least to nearly 60 per cent of them. If Florida can devise a better, bully for Florida, but California is pretty well satisfied with her Exchange, which is the largest co-operative marketing association in the world.

PRE-COOLING IN FLORIDA.

Florida shippers of oranges are making their first experiments in pre-cooling. Many shipments have been packed close in the car and sent out to care for themselves. Now, a paper says: "It is necessary to strip cars thoroughly so as to have good circulation of cold air through the fruit; also, that too many boxes can be put into a car. A car of 340 boxes just fills a refrigerator car full, two boxes high from one end of car to the other and consumes about two-thirds or three-fifths of the car's space.

"All of these cars were handled with despatch by the transportation companies.

"With a central packing house and a pre-cooling or refrigerating convenience attached the citrus business can be guaranteed a safe, sure and remunerative one."

POTASH MAY PREVENT IT.

We are somewhat inclined to the opinion that much of the decay of Florida oranges at the ripening season and while in transit to market—of which much complaint is now being heard, though doubtless exaggerated—is due to a deficiency in the application of potash to the trees during the bearing season. It has been noticed and trees standing near fowl yards and frequented by chickens present the same difficulty every season, which is attributed to an excess of ammonia. If this were counteracted by the liberal use of potash at the right time the trouble would be largely diminished if not entirely avoided. —Tampa Times.

A correspondent writes as follows to the Florida Fruit and Produce News: "Referring to the suggestion made in a recent issue of your excellent paper, that Florida orange growers send a committee to California to study the methods employed by the growers of that state by means of which the business has become one of great profit, it would be more practicable, it appears to me, to arrange with the California Association to send us a thoroughly experienced and capable man to take charge of the orange packing and marketing interests here with a view to organizing along the lines of the California Association.

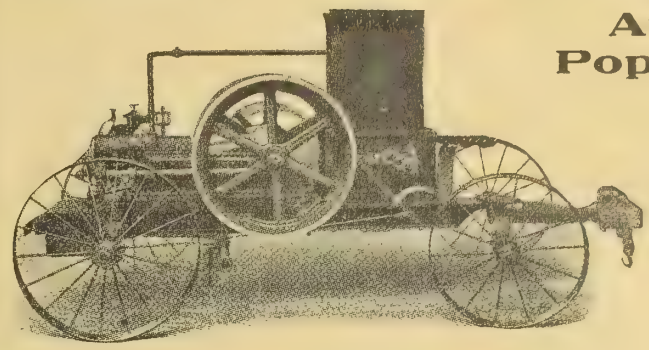
"Beyond question there must be organization, and that of the right sort, or our Florida growers would better abandon their groves and turn their attention to something else. Let us, however, rather use the system which is the result of years of experience and which is making of the California orange industry, a mine of gold."

An editorial in the same issue adds: "Our growers should secure the services of a practical, experienced man who is familiar with the methods in vogue in California; that he may go over the ground here and work out a plan suitable to the conditions and needs of the Florida growers. If the services of such a man could be secured, and a plan of visitations be outlined whereby he could make a tour of the state to meet and talk to the orange growers direct, more could be accomplished towards organization than by any other method yet suggested. Meetings should be arranged for and advertised in advance to secure as large an attendance as possible of those interested. Stereopticon pictures from actual photographs should be used and a general plan of educational campaign carried out. Such a scheme would cost money, but this should not be insurmountable. What is needed now more than anything else is some man of large views, of a philanthropic disposition and with the genius for leadership who will take hold and put it through. Where can he be found?

The chinaberry must go. It harbors the pestiferous whitefly that is infecting the orange groves in some parts of the state, and prevents the final extermination of the insect. The chinaberry was never of much use anyhow, and we don't think it will be missed very much.—Produce News.

Lambert Portable Engines

Are Popular



2 1-2 to 20 Horse Power

Because Guaranteed to develop 10% in excess of rated H. P. Rigid construction and moderate weight. **Costs Less** than others not as good. Balanced centre crank prevents Vibration—most modern and effective cooling system. **We Believe** an inspection will convince you that the Lambert Portable Engine is far superior to any on the market, and we have made a price to get the business.

FOOL RUMORS.

Rumors which did vast damage to the strawberry industry of all Southern California were started in the strawberry growing centre of Gardena, a few miles out of Los Angeles last week. Strawberries had become plentiful, consequently they were cheap, many families supplied themselves with quantities of the berries and as a result of over-eating, or, maybe, for some other reason, were taken sick. The first excuse which they offered and seemed to be plausible was that the Japs from whom the berries had been purchased had sprayed their vines with Paris green or some poisonous mixture to prevent attack of insects. Of course, no one stopped to see whether this had been done, but instead rushed to the daily papers with the claim that the Japs were poisoning their berries.

The city dailies, of course, came out with big headlines and the great berry buying public proceeded to cut off strawberries, whether grown by whites or Japs, from their bill of fare. This, of course, caused investigation of the Japs and the physicians who had the cases in hand and it was soon proven that poison had nothing whatever to do with the sickness. But, of course, the damage was done and it is now said that the white berry growers of Gardena alone suffered to the extent of more than $1000 per day as the result of the senseless charge which had no foundation whatever, in fact.

This is not the first or only time that such reckless disregard of the truth or the property of others has impelled untruthful people to start these rumors. The damage is, of course, great not only to the one community, for in this case not only Gardena but various sections all over the southern part of the state suffered, because timid housewives are even yet refusing to buy berries because of fear of poisoning. It is unfortunate that an example cannot be made of those who made such groundless charges.

PRUNES.

The report of the committee of fifty which was made at the recent prune growers meeting at San Jose and from which we quote liberally on first page of this issue, gives some excellent reasons for co-operation amongst prune growers. We think the principal one mentioned by the committee is this, that a higher grade of fruit shall be put up. We do not refer to the quality of the fruit as it was grown, so much as to the manner in which its quality is lowered by the method of packing. We know of one household where the housewife has vainly tried to get satisfactory fruit of this kind. The ordinary boxed prunes have been packed direct from the boiling vat and put up so wet that they have lost their value and become mushy, and in fact, to quote a housewife's own words, "nasty mess." It may seem harsh to speak of this fruit in that way, but one who likes such fruit and has tried vainly to get a good, firm, meaty fruit, only to have a mushy, soft fruit continually put upon them, loses their temper and speaks as did the housewife. This same housewife remarked that she had tried all the groceries to get some of the ordinary cured prune, which had not been destroyed by "Processing," but the grocer spoke of this as being unclean and not fit for sale, and of course could not supply them. There is one brand of prune put up in tins hermetically sealed, but these are not kept by the general run of grocers. They are exceptionally fine when they can be had.

Now, if the prune growers will accept this one recommendation of the committee on co-operation in marketing and then advertise liberally to show that a higher grade of prunes are now being put out, we do not believe that 100,000,000 pounds of prunes a year, or even double that, will be sufficient to flood the market and discourage profit bringing prices.

ARABIAN ALFALFA SEED.

We have received considerable inquiry as to where Arabian Alfalfa seed may be secured and find on inquiry that it is possible none may be had for this spring planting. Regarding the matter we inquired of Prof. G. W. Shaw, of the State University, and he writes as follows:

"It will not be possible to obtain Arabian alfalfa seed at the present time. There will probably be some seed available next year, but in rather limited quantities. I may say that the Department of Agriculture is making an effort to ascertain how large a call there is likely to be for this type of alfalfa and to secure definite statements as to how much could be disposed of. They do not state at what price, but I presume it will cost double that of the common seed."

From this it would appear that the person who is interested in this seed would do well to get in touch with the department or with Professor Shaw at once. The person should have the insurance of his having seed if he intends to plant this most desirable of all the alfalfas. At least present indications are that it is the most desirable for California conditions. It is possibly more susceptible to the cold weather than the ordinary alfalfa, though in Imperial Valley it has permitted cutting, we believe, eleven times during the year.

Raisins and oranges have each had their turn and now we imagine the prune men have an itching along the same line. If not they should have for the industry needs just the stimulus of some such agitation as the raisin question is now having.

RAISIN DAY.

Friday, the 30th of this month, has been settled upon as the day to eat California raisins. It now appears that more general observation of the day will be made than ever has been given to a similar advertising proposition. The suggestion has been taken up in a more general way than was anticipated by the management of the advertising and the committee at Fresno has been floored with requests for information as to the day and as to the steps necessary to take in order to give as big a boost as possible.

Surely the industry needs encouragement. During the last year a condition has prevailed which is almost equivalent to disaster for the raisin producers. This campaign may be too late to save the day for these men on this year's crop, but doubtless great, permanent good will result to the industry as a whole. We presume the day will become an annual one, though we imagine better results might be obtained by changing the day to one in the fall when fresher and higher grade raisins can be placed on the market.

FLORIDA COMMITTEE COMING.

We understand the committee of Florida orange growers which is coming to California to investigate citrus fruit packing and shipping conditions here, will arrive next week. The Florida citrus growers have been in hard lines in marketing their fruit for some time. There has been no organization to control shipments and the method of packing has been unsatisfactory to some of the trade so that most unsatisfactory returns have been secured by the growers. For several months there has been agitation of the matter of co-operative marketing or of some step which is necessary to give the industry greater encouragement.

We extend welcome to our Florida friends and trust they will find much in California to inspire them to better work and, of course, we hope they will bring some suggestions for California growers which may prove of value.

THE APRICOT OUTPUT.

Present indications go to show that this year's output of apricots will be most satisfactory as to quality, that is so far as can be determined at this early date, and the quantity will be well up to the average. For the last two weeks the Cultivator has given estimates from various sections and, just as we go to press, we have another letter from Ventura county, written by Mr. T. W. Spier, in which he says: "From information and observations find apricot crop in county promises well. Fruit is equally destributed on trees and ground full of moisture. Estimate crop at 85 per cent, providing favorable weather continues." Ventura is one of the largest apricot producing sections of the state.

The report from Pomona and from Fresno indicate somewhat of a shortage, but we believe all told, the average will be good. In some sections like Pomona shortage is occasioned by decrease of number of trees rather than by crop conditions.

Mr. Mills reports Sacramento Valley rather light crop of high grade.

Shop Talk

TRIAL SUBSCRIPTION OFFER.—On another page of this issue of the Cultivator will be found an advertisement of a special trial subscription offer. Without doubt the readers of the Cultivator have never before had such an opportunity for getting acquainted with the best magazines. Even this offer is now limited to the first of June and we wish to impress upon those interested the importance of sending in orders at once.

Every ranch home now receives its regular monthly and weekly magazines, which are necessary to every member of the family, and this assortment presented by the Cultivator contains publications suitable for all.

Our subscription department has received during the past year and will continue to receive orders for any books and magazines in the market. We do this, of course, for our own interest as well as for our subscribers, and while we, as publishers, obtain reduced rates, we allow the reduction to benefit our subscribers as an additional attraction to our paper. Just bear this in mind and let the Cultivator order your reading matter for you. In the meantime send us $2.25 for the phenomenal trial list offered this week.

Agricultural Notes of the Pacific Coast

Northern California

Fruit outlook for Chico, Butte county, is exceptionally good.

Beet seeding is yet going on at Winters, Yolo county. The acreage this year will be large.

The town of Paradise, Butte county, is planning for the extending and beautifying of a natural park.

A shipment of fruit trees from Missouri to Sutter county was found to be infested with peach root borer.

A hailstorm recently visited Auburn and did some injury to the fruit industry, but the outlook is still fair.

The Government plant introduction garden at Chico is experimenting with an introduction of Asiatic melons.

Students at the State University Farm at Davis, are given trips to different ranches in order to show them the methods of work.

A number of wells have been sunk near Davis which have proved exceptionally satisfactory in furnishing irrigation supply.

An addition has been made to the Burbank experiment farm at Sebastopol which is now being planted to experimental fruit trees.

The weather forecaster at Sacramento predicts that the Sacramento river will be higher this summer than it has been for six years.

Almond growers of Yolo report approximately one-third of an almond crop, while in other sections some reports show quite large setting of nuts.

The State University issues warning to farmers to beware of agents selling "stone dust" which may be claimed to be of value as a fertilizer.

The Morse Seed Company of San Francisco will make large plantings at Haywards for next year's seed supply. Forty acres will be planted this year.

It is expected that a creamery will be completed and in running order at Cottonwood, Shasta county, shortly, which will handle the milk from 500 cows.

Palermo fruit growers take exceptions to the plan of a fruit shipping house sending out oranges from that section under Southern California brands.

The board of supervisors of Colusa county has appointed a highway commission to investigate the needs of the counties in the matter of better roadways.

It is said that over two thousand visitors from various towns recently visited an incubator plant in Petaluma on a day when 18,000 chicks were hatched.

Marysville proposes to have her system of levees reinforced and increased in heighth before the first of October so that no possible flood can drown them out.

Prof. Jaffa has been looking over the State University grounds in the expectation of establishing a poultry plant as part of the educational features of that institution.

The Sonoma County Pomona Grange at its recent meeting at Healdsburg, unanimously adopted resolutions condeming the proposed increase of salaries of county officers.

Central California

Prunes promise a fine crop.

Asparagus canning is in full swing.

Tulare county has developed a regular organized cattle stealing syndicate.

Impetus to raisin shipments has been given by the great Raisin Day campaign.

Surplus stock of prunes is nearly all shipped, and it is expected prices will soon advance.

One cantaloupe buyer at Turlock is offering to contract for three hundred acres of melons.

One grower will plant one hundred acres of oranges near Terra Bella, Tulare county, this spring.

Contractors at Lodi are already offering to contract for Tokay grapes at $20.00 to $25.00 per ton.

Deer Creek, Tulare county, ranchers report about sixteen sacks of barley to the acre as a probable yield.

It is proposed to build a large reservoir for storm water storage near the La Grange dam in Stanislaus county.

Lincoln Grange of Cupertino, Santa Clara county, celebrated the ninth anniversary of its organization, last Saturday.

It is expected that the melting snows in the Sierra Nevadas will soon give high water to the rivers of the San Joaquin valley.

The San Jose Grange recently passed resolutions endorsing the bill appropriating funds for the state farm at Davis and urged that the bill be signed.

A cattle company is being formed at Corcoran with a capital stock of $500,000, which will handle cattle in a large way, fattening on the sugar beet pulp made at the factory.

It is estimated that three million sheep which are owned in California were given about seven million dippings for scabbies last year. The percentage of the disease has been reduced from 15 to about 8 per cent.

At a recent meeting of orange growers at Lindsay the Lindsay Growers Protective League perfected an organization. The executive committee consists of G. S. Berry, R. H. Shoemaker, C. O. Cowles, W. B. Kiggens, and H. C. Morrison.

A car of orange trees shipped to Lindsay and found infested with yellow and black scale was denied admission to the county by the Horticultural Commission and trees later defoliated and scrubbed with kerosene emulsion and later released.

The act passed by the recent legislature which makes it a misdemeanor for any person to harbor or permit ground squirrels to infest the property, will probably give an impetus to the effort to subdue or, if possible, rid the state of these expensive pests.

The prune growers of Santa Clara county are somewhat divided as to whether to follow the farmer's union plan of disposing of their coming prune crop or to organize a co-operative movement more along the line of the orange growers exchange. The greater number prefer the latter method.

Southern California

Santa Ana will observe next Saturday as clean-up day.

Somis, Ventura county, reports a fine apricot crop this year.

Imperial valley cabbages are commanding not far from $45.00 per ton.

The California Vegetable Union is now paying $45.00 per ton for cabbage.

Fullerton has shipped over five hundred boxes of asparagus to the East.

A Cultivator representative at Fallbrook reports a good outlook for all crops.

El Centro recently shipped two cars of onions which netted 3 cents per pound.

A large packing house at Alessandro, Riverside county, was recently burned.

Tri-counties Reforestration committee is holding a meeting at Redlands this week.

Escondido farmers report the finest promise of barley hay ever given in that section.

A twenty-seven hundred acre ostrich farm is in contemplation for Imperial valley.

Nearly two hundred cars of oranges are being shipped every day. Most of them under ice.

Codling moth parasites have been sent by the State Horticultural Commission to Riverside.

The Ojai Valley Orange Growers Association has disposed of the fruit this year satisfactorily.

Orange shipments are going forward on a more liberal scale than at any time this season.

The Department of Agriculture is experimenting with a refrigeration car in pre-cooling of oranges at Riverside.

The Yucaipe Lumber Company will plant several hundred acres to eucalyptus trees in Yucaipe valley, San Bernardino county.

Citizens of Westminster are petitioning for the construction of a drainage canal which will make available much new land.

The Palo Verde Mutual Water Company has a large number of men at work in the Palo Verde valley laying ditches for irrigation.

The Government Experimental Refrigeration car for pre-cooling fruit has had its first trial and has been pronounced a success.

San Bernardino county apple growers have had some trouble this year with wooly aphis and some shipments of nursery stock have been found infested.

The Jersey Farm Company is the name of the new corporation which is now building large barns and is getting ready to produce milk to supply the city of Santa Ana.

Imperial alfalfa is ready for market and some has already been shipped. It is commanding $6.00 per ton in the stack. The harvest of barley hay will begin in about a week.

Ventura county bean growers are succeeding in working out the details of a co-operative marketing organization. The members hope that this year's crop will all be marketed through it.

The Coast

The first California strawberries to be sold in Spokane arrived about April 1st.

Alaska dealers have placed an order with Seattle grain growers for four million tons of oats.

Boulder, Colorado, contemplates irrigation extension which will bring 3000 acres under the ditch.

Portland, Oregon, has a new creamery which will be thoroughly up-to-date and have large capacity.

Irrigation plans contemplated in the state of Colorado will add over one-half million acres to its tillable lands.

It is hoped that the Government will aid in the reclamation of nearly a million acres of land near Prosser, Wash.

The apple king of Hood River, Oregon, is Oscar Vanderbilt, who will soon have one thousand acres planted to apples.

Rains which recently came to Colorado farming lands saved the wheat crop which until that time was in a serious condition.

An irrigation project which will bring twenty thousand acres of land under irrigation at La Grande, Oregon, is under way.

Fruit growers of Pecos valley, New Mexico, have formed a co-operative fruit grower's association which will look after the marketing interests of its members.

An effort has been made to secure the removal of the sugar factory from La Grange, Oregon, to Utah. This factory has had a pay-roll of about $160,000 a year.

The Wyoming Stock Growers' Association representing practically all the cattle growers of that state have adopted resolutions protesting against the removal of duty on hides.

Three additional dairy inspectors have been appointed by the state dairy department of Washington which it is hoped will give better service in the dairies of the state.

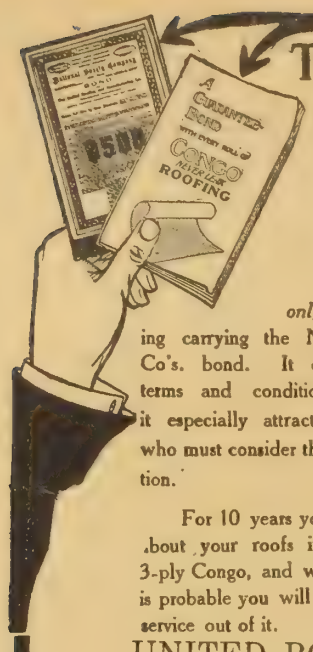
Orchardists in Lynn county, Oregon, have done more spraying during the past season than for years. It is expected that an exceptionally good crop will be marketed next season.

Fruit generally over the Sacramento Valley will be later than last year. The first box of cherries out of Vacaville last year was April 16. It is thought that it will be at least the 25th this year.

Oregon hop growers are concerned lest the production the coming year shall be excessive again. Reports of loss in the hop yards have been exagerated and the shrinkage which was fully expected will not be great.

The farm demonstration train under the auspices of the Washington State College reports 2800 visitors to the train in one day. The train was met at some places by school children in parade headed with flags and band.

Suit has been filed by the Farmers Educational and Co-operative Union of America through its committee for Washington and Idaho to require railroads in Washington and Oregon to give the same rates on grain, livestock and other farm products to Astoria as to points on Puget Sound.



THE GUARANTEED ROOFING

CONGO

A SURETY BOND with every roll

Congo is the *only* Ready Roofing carrying the National Surety Co's. bond. It carries with it terms and conditions that make it especially attractive to anyone who must consider the roofing question.

For 10 years you can rest easy about your roofs if covered with 3-ply Congo, and we know that it is probable you will get *even longer* service out of it.

The Surety Company is issuing these bonds, and back of them is their *two million dollars of assets.* It is a matter of keen satisfaction to us that they were willing to stand behind Congo Roofing.

You are immune from any responsibility other than giving the roofing ordinary care.

Write to-day for samples of Congo and full information.

Remember, that with *every* roll of Congo you get a genuine Surety Bond.

Rex Lime & Sulphur Solution
For Grape Mildew

This famous preparation of calcium sulphide has been found to be far superior and cheaper, and easier applied to grape vines for Mildew than Dry Sulphur. It also prevents the Thrip from remaining on the vines; it is a tonic to the vines; is guaranteed to be of a strength of 33% Beaume test with the largest possible amount of the Solution in the penti-sulphide form. It can be used in the dry weather and will adhere to the leaves and will not be blown off by the wind as Dry Sulphur.

Farmers, Take Notice

To increase your crop in quantity and quality you must fertilize. The Tom Lewis fertilizer insures big crops for everything that grows. The best and cheapest fertilizer made. It is the farmers' money maker. No trouble to use. Big crops are sure to follow. This fertilizer produces 6 to 10 pounds of grapes to the bunch. For catalogue and prices write

Thomas Lewis, 1916 10th Street, Sacramento, Cal.

Deciduous Fruit Culture

By J. W. Mills

AMERICAN APPLES IN EUROPE.

ANNOUNCEMENT is made by J. F. Pershing, who has returned to Spokane from a tour of Europe, that he has arranged for the sale of $450,000 worth of Washington apples in London, Liverpool, Paris, St. Petersburg, Berlin and Hamburg this year. Mr. Pershing sent 20 cars of apples grown along the upper Columbia river to Europe last fall, and says he received good prices, disposing also of the entire consignment. He also made arrangements with the commission men of the cities mentioned to handle the fruit next season.

Mr. Pershing says that William Dennis, lord mayor of Westminster, head of the firm of Wm. Dennis & Sons, the largest apple dealers in the world, will visit the Pacific Northwest next summer, and will be in Spokane some time in July. Mr. Dennis is greatly interested in the horticultural possibilities of the northwestern states, and is coming to learn more about the country. Mr. Pershing said:

"During my trip I spent some time in Paris, and was most strongly impressed by their methods of packing there. In this regard they excel the Americans in every way. All of their fruit is packed between layers of excelsior, and one apple never touches another, thus preventing any blemishes.

"There is a vast field in Europe for the sale of American apples, and I believe that in the next few years Americans will sell most of the fruit throughout Europe. Delicious and Winter Banana apples are the chief favorites, but there is a good market for most other varieties.

"American apples are new in France, but they command good prices, and with improved methods of packing I believe that the French market there can easily be controlled. There are no cold storage plants in Paris, and if American apples are shipped there about the time that their own apples are off the market, good prices can be secured."—Southern Fruit Grower.

RAISIN DAY.

(Continued from Page 467.)

imagine that good raisins, currants, and dried fruits cannot be produced in Australia, they should inspect the samples lately received at the Chamber of Commerce.

The present acreage in wine, raisin, and table grapes in Australia and South Africa is as follows:

	Acres
Victoria	26,435
South Australia	22,575
New South Wales	8,521
West Australia	3,521
Queensland	2,070
Total	63,122
South Africa (Cape Colony)	33,000

The above countries are practically the only ones that produce raisins and currants; some raisins and grapes are from Chile in the Huasco Valley, and also in Persia, but they are consumed locally and never come on the market.

There is little or no demand for California raisins in Australia at the present time, both on account of local production, and also because the import duty on them amounts to six cents a pound. New Zealand takes about a million pounds, but the best customer is Canada, which consumed in 1907 upwards of six million pounds, and no doubt a ready market might be found there for a much larger quantity if steps were taken to bring them more before the public.

It has recently been suggested that a large quantity might be disposed of to the many co-operative societies in Great Britain, but it has been proved long ago that they cannot compete with the Spanish raisins, owing to the low cost of production in that country.

The following figures will make this fact clear:

California Raisins Imported Into the United Kingdom:

Year.	Pounds.
1899	90,740
1898	38,638
1901	114,696
1900	315,000
1902	17,425
1903	55,006
1904	3,864
1907	138,980

California raisin growers are not the only ones interested in the industry who have had a bad year. One of the largest produce firms, established over a century, with an office and warehouse staff numbering upwards of nine hundred, writes from London on the 23rd of February regarding raisins and currants:

"A very large proportion of the shipments arrived in London on bad markets, and showed heavy losses to all concerned in the distribution. Prices also fell in the countries of production fairly early in the season, but it is impossible to say what is an average of prices obtained by the growers."

Value In Present Effort.

Great good should come to the raisin industry from this effort. Great good should come to all branches of the fruit industry, for this, like the orange advertising campaign, is teaching the value of advertising to teach the people the value and healthfulness of fruit food.

PRUNE ORGANIZATION.

(Continued from Page 467.)

and housewife how to prepare the prunes in the many ways they may be prepared, to make them palatable and attractive to those who are to eat them.

"In this connection also inform them of the healthful and nutritive quality of the prune.

"Third—Reduce the price to the consumer. We can not expect the consumption of prunes to be what it should be while the retailer asks the consumer 15 cents per pound or more for prunes that cost him 5 or 6 or even 7 cents per pound.

"Fourth—Advertise to call the consumers' attention to the desirable qualities of prunes and how to cook them, and to induce them to buy and eat them. This advertising will also enable you to reduce the price of prunes to the consumer.

"To accomplish these results we need not start in to revolutionize the business of handling and marketing prunes. What is necessary is to follow the prune after it reaches the retailer and see to it that he sells it to the consumer at a reasonable price and help him to sell it.

"To accomplish these purposes the following plan has been discussed and is submitted for the consideration of this convention:

Corporation Proposed.

"The organization of a corporation made up of growers; all growers being entitled to membership and a voice in its affairs. This corporation through its officers and agents shall investigate methods of drying, packing, etc., and inform all growers of the best methods to be pursued to put the fruit in the most perfect condition for sale to the consumer. This corporation shall also undertake an advertising campaign throughout the consuming districts in the East. This campaign being designed to inform the people how to prepare prunes in

The Story of Kerman

The question naturally arises in the minds of many: If all that is claimed for Kerman tract is true. If it is true that this tract is today attracting more interest than has any other tract of agricultural lands in California; if it is true that more wide-awake, actual settlers have come to this tract since last November than have come to any other tract in California in the same length of time in years, if not in the entire history of the state—if all these things are true—(and they can easily be verified) how does it come that it has laid then unoccupied so long? Why have not local men snapped up these chances in the past? These and similar questions arise and demand an answer.

A Portion of Kerman showing the Kerman Inn, the Pioneer Block and other buildings. Photo taken from the park.

And there are reasons for this condition, the same as there are for any and all conditions. "Nothing happens," and nothing has happened here that is not the result of natural causes that are easily explained. First, in the last issue we explained how and why it was that this great domain—an empire almost—that is destined in the future to attract the attention of the country as the greatest producer of high priced semi-tropical fruits, alfalfa, dairy and poultry products, had been lying here almost ignored, not only by the homeseekers from the East, but by the thousands of Californians who in the past have turned to irrigated soil for sustenance, comfort and often opulence. It seems almost incredible that a valley as rich as are certain sections of the San Joaquin could have been so securely hidden from the hundreds of thousands of land hungry people who of late years have settled the semi-arid plains of the middle West, have populated all of Northwest Canada and have congested the irrigated areas on the north coast, till the best lands there now cannot be had for less than thousands per acre, some of them selling as high as $3,500 per acre, actual cash transactions; it seems strange, to put it mildly, that this area should not have attracted due notice. But it did not, and the reasons are now clear to all who have given the matter a little thought. And the Kerman tract suffered in common with many other localities, but more so.

What is now the Kerman tract was at one time a sheep and cattle range. Later it became a part of the famous wheat fields of California and the amount

The Kerman Inn and the new Club House.

of wheat these lands produced per acre is yet looked upon as being record breaking. Years ago this tract passed into the hands of one of the most powerful banking institutions in the United States. The lands were rented and were continually cropped until their values became so high that it was no longer possible for dry farming to pay a rental high enough to pay interest on the amount they would bring when sold for other purposes. The bank which owned these lands some twenty years ago secured the magnificent and almost unique water right which is now doing more than any other one thing to make these lands so highly sought. But the professional wheat farmer is not an irrigator, and hence but little use was made of the water right.

A few years ago the Kerman tract was bought by the Fresno Irrigated Farms Co. They knew of the possibilities of this tract and had faith in it. Arrangements were made to colonize the tract. In fact, the work was begun and some of the lands were sold. It takes time to bring a tract like this to the attention of the public, and while sales were made, the movement did not gain great momentum when the fire and earthquake occurred at San Francisco. The lands that had been sold had been taken principally by Californians, the "Fire" disturbed financial affairs very materially, and many who had money to invest concluded to hold back till matters had readjusted themselves.

Close upon the heels of "the fire" came the panic in the East, which further held back those who were reaching out and seeking either investments or new homes.

And yet progress was made at Kerman. Orchards and vineyards were set out, lands were put into alfalfa, settlers were building comfortable homes. Schools were built and the town of Kerman was changed from a water tank and a depot merely to one of the liveliest little towns in the valley. Kerman has today two hotels, one modern in every particular, a national bank, numerous mercantile establishments of all kinds. Kerman has electric light and power, telephones, water and sewer system, and the tract has rural free mail delivery. A new reinforced concrete school building will be ready for occupancy September 1st. Kerman is the home of the California Stock Food Co. and their alfalfa mill is located here. This mill stands ready to take every ton of alfalfa that can be grown on the tract and pay cash for it, the price last year at the mill running from $8.50 to $13.00 per ton. Kerman has an electric lighted park. New houses are springing up, and yet several families are now living in tents awaiting the erection of their homes.

In short, Kerman is today an up-to-date little city, furnishing all required conveniences. It is located on the main line of the S. P. between San Francisco and Los Angeles, being now a freight division of the Southern Pacific. The "Owl," the fastest train on the S. P. system, stops here, and we have also the new motor car system, furnishing rapid and frequent transit.

The New Era

The possibilities of the Kerman tract became known in the East, and six months ago people from there began to come here to investigate. That proved the opening of the new era, and since that time more land has been bought and put into fruit and alfalfa than in any other year of the past. People have come here singly and in parties, and but a very few have left here without purchasing.

The Empire School on the Kerman Tract

And these purchasers are not speculators, but people who are coming here to make their homes. Dozens who have bought since last fall are already on the land and are improving it. Improvements are rife on every hand. Up till April 8th, 6,000 acres of new lands had been put under water this spring, and 1,000 more in late crops will be put under water before the season closes. Miles of new canals and ditches have been made. Over 300 acres have been put into cantaloupe by the new settlers this month.

Merely Started

While much has been done, it is only a start. The tract is but beginning to be known. Early efforts are bearing fruits and the new settler can now tell what he can do from what has been accomplished by those who came here early. It is no experiment, and those who are really looking either for a home or gilt edged investments rarely leave here without purchasing, and then going home trying to induce friends to come here while it is yet a "ground floor" proposition. One agency in the East writes us that by next fall, when crops are secured there, there will be a landslide to the Kerman tract; that all who have been here are

A familiar view on some of the road corners on the tract, showing that settlers are numerous.

enthusiastic about the future possibilities, and that it will be more a question of supply than demand.

Now is the Time

The man who makes the most money is invariably the one who "sees it first." Those who come before the rush from the East sets in next fall will get the choice locations, and also the benefit of the rise in value. The future of the Kerman tract is absolutely secure. It has the best water right, the soil, lay of land and the climate to produce high priced products. There is no pioneering. Everything is ready for the home making. Investigate it now. FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.
When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 39 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

different attractive ways; to increase the consumption and to reduce the price charged by the retailer to the consumer."

* * *

Advertising and plans of extending consumption are each discussed in the report at some length. Later the report says:

* * *

System of Inspection.

"In order to prevent poorly prepared fruit being packed under the brand that would be advertised it would probably be necessary for some system of inspection of the fruit packed to be put in operation.

"It may be thought that this money would be taken out of the growers and that the price he would receive would be so much less. This will not be true. The advertising campaign and the work of the Grower's Corporation to promote the sale of prunes to the consumer would both make it easier to sell prunes and bring such stability to the business that the packer, wholesaler and retailer could all well afford to contribute their effort to get this money for use of the Growers' Corporation without cost to the grower. But with the organization of the growers as planned they will be in position to demand and obtain a price that will enable this money to be obtained without cost to them. But they must show a determination to correct the wrongs that have grown up in the business and promote and push the sale of their product or nothing can be accomplished. If we dump our prunes onto the market and let them become the ridicule and prey of every competing interest, we may expect a continuance of the unpleasant conditions of the past. But if we put the prune in the strong position among food products that it is by its merits entitled to, we can make it a popular and profitable product. We must not wait for others to do this we must do it ourselves.

"This is only a brief outline of the plan contemplated, but it can be easily worked out in detail by the Central Corporation, and if the prunegrowers of Santa Clara Valley will enter heartily into it, it is believed that it will furnish the solution of the difficulties under which they are now laboring.

"The plan may not furnish much, if any, increase in price the first year, but it will market the prune crop and help it be consumed, and if pursued for a term of, say five years, it is believed that each succeeding year will show an increasing demand and an advancing price and this without cost to the grower.

Pooling of Fruit.

"It is believed that it will greatly aid the successful carrying out of this plan if the growers will organize District Associations in which they will pool their fruit and sell it together somewhat after the plan of the very successful Orange Growers' Association. They need not store their fruit together unless that is found desirable, but if they would select one of their number to sell their fruit to the packer and to represent them in the general Growers' Corporation referred to, they would greatly reduce the danger of competition in selling and their representatives coming together in the general Growers' Corporation would make that corporation a smaller and less unwieldly body.

"Assume that there were in this valley 20 or 30 of these District Pools or Associations representing all the prunegrowers, each District Association could, if they were legally incorporated, contract with the general Growers' Corporation to carry out the plan proposed and the contracts required to cover the prune crop of the valley would be greatly reduced in number and the business much simplified.

"Each association would elect one member to represent it in the Central Growers' Corporation, and it would be easy for these 20 or 30 men to meet together and after fully reviewing the situation fix a price at which the crop would be sold to the packers or the trade. Under this plan every grower in the valley would obtain the same price for the same grade and quality of fruit, and the prune business could be put on a stable basis such as it has never up to the present time known.

"Of course, some growers would not join these District Associations and it would be necessary to permit growers who were not members of the District Associations to join and make contracts with the General Growers' Corporation that all the fruit might come under the plan to be carried out by the Growers' Corporation.

Prevent Price-Cutting.

"While the organization of these District Associations would accomplish much in preventing price-cutting and the demoralization in the trade that follows, it is believed that the organization of the District Associations alone would not accomplish all that needs to be done to put the prune business on a stable and profitable basis. We must correct market conditions in the East and enlarge the market for prunes. With this done, it is believed that the organization of the District Associations would by providing a means by which the growers may act together, enable them to reap the full benefit that should come to them as a result of the work of the Central Growers' Corporation .

"We desire to make it clear that this plan does not contemplate the transfer of the fruit by the grower to the Central Growers' Corporation. The grower holds his fruit until it is sold and the money paid for it.

Work Together.

"The plan is designed to bring all the growers into closer co-operation and to enable them to work together as one man for the common welfare. It will not take from the grower his fruit before he is paid for it and subject him to the danger of having it unwisely handled with resulting loss to him. It will not subject him to the danger of the hostile opposition of all the packers and dealers now handling his fruit. It is designed rather to enlist the hearty and enthusiastic co-operation of every one now engaged in the business. In short, by showing that the growers are united in an effort to promote and aid the marketing and consumption of their product to bring to the conduct of the business, the active and harmonious co-operation of all those engaged in all its branches, which will certainly result in enlarging the market for prunes and establishing the business upon such a permanent and profitable basis as it has never known before. The one who will reap the profit from all this labor will be the grower."

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. Minna E. Sherman

QUESTIONS.

THE ordinary cows in the dairy will produce a full amount of milk on a ration of forty pounds of corn silage and ten pounds of alfalfa hay. The common cow does not have more capacity for milk making than this amount of material fed to her will produce. Now, if this amount does not bring out the full capacity of the cow we can do that best by adding some grain. The best mixture we have been able to make in the way of economy is to use 40 pounds of corn silage, 15 pounds of alfalfa hay, two parts rolled barley, two parts bran and one part oil meal, feed of this a quart twice a day and when we increase this for some special cow to double the amount, we cut down the alfalfa hay to ten pounds. We did feed at one time 40 pounds of corn silage and 20 pounds of alfalfa hay but found that the cows could not digest it as well. The amount of woody stuff in it was too much for their stomachs. When we have Egyptian corn we sometimes feed that instead of the barley using two parts corn to one of bran and one part cocoanut meal. This last mixture makes the finest flavor in butter also of a good firm texture.

Vetch.

Winter vetch is rather slow in coming along to make it a servicable crop for winter grazing, or for cutting green. It is one of the best crops we have for green manuring, but not for soiling cows. The alfalfa and other crops are ready before it is in the early spring. Vetch at the University grounds in Berkeley is a wonderful grower it seems to find there sufficient rain and warmer winters that in the San Joaquin valley. Turnips are not as good for our use as Kale or sugar beets. These are little grown for cows, but afford a large quantity of nourishment. Mangel wurzels also grow to great size, but are less rich in feeding value. The pumpkins are readily grown and give heavy yields with little labor. The Cushaws, or crooked necked squashes have a heavy shell and will keep until spring if handled with reasonable care to prevent bruising in hauling them into the barns.

Sorghum.

Sorghum and Indian corn are our staple summer crops for the cows. Either may be planted on irrigated land as late as July 4th and give good yields. These may be cut for summer feeding or allowed to go to seed and then cured. The sorghum will come again and again if not cut below the first joint. We never tried it willfully without irrigation, but have had some that did grow in old fields without irrigation or cultivation and from seed. I should not hesitate to try some of it planted now and kept well cultivated to produce a dust mulch without any other water than is now in the soil. While the tonnage would not be as great as that from an irrigated field I think it would produce enough on this ranch to make it profitable. If alfalfa grows without irrigation then of course the sorghum will do so. The fact that Kafir and Egyptian corn are sorghums must not be forgotten.

Sire.

In handling dairy cows avoid as a pestilence the grade bull. The old law we often hear our grandmother quote that "Son like the mother. Daughter like the father." This is even truer of dairy stock. The dams are bred as milkers from any kind of cows and have behind them a mixed strain. Now breed these cows to a sire that is equally mixed and the result is a still worse jumble up of characteristics. Now use the pure bred sire and the young cows are half by him. This half is bred all one way or it is or should be a pure dairy type. Now this half pure is apt in a large per cent of cases to have the "pull" or ascendency in the creating of the animal. The fact that the heifers do take after the sire more strongly than after the dam can be seen. The color marking and form will show up strongly stamped on them. Now look at the young males from the same herd and they do not look nearly as fine as their sisters. They have taken after the dams strongly and are of mixed conformation.

Color.

Pardon me if I speak of the Holstein grades for a minute, for I have observed them more closely than any other breed. The third cross the heifers will be marked and look like full bloods. So strong is this that we cut the point of the right ear off when they are born so there can be no doubt as to their being grades. The color on these animals will stay on the bodies leaving the legs white. Now look at the young males and these will show the grade at once in many instances the legs will be a series of black spots badly broken up and reaching down to the hoof. The color of the breed will stay black and white usually. Now one of the curious things is that in breeding a black and white sire to a red short horn cow the offspring will nearly always come a solid black. If the short horn is a roan then the color comes out blue and white. In horses we see the same thing for there the black mares will sometimes turn the color to sorrel. If there is a string of blacks or brown mares, this sorrel or chestnut color crops out quite often.

Grade Sire.

The use of a grade sire in the dairy herd will still leave us some cows that are fair milkers, but the majority will be worthless. The pure bred sire can be counted on giving more than half the heifers a greater milking capacity than their dams. The next generation will increase this per cent greatly and the third generation should be as good as pure bred cattle in dairy performance. This result, of course, is obtained by culling out the poorer ones in each generation. The culling of mixed bred cattle can also be done. I know one herd of every kind of grades that the man has had selected for him all over the state and they represent an average

Suits Against Infringers of DE LAVAL Cream Separator Patents

Affecting the Standard Separator Co., the Iowa Dairy Separator Co., the Peerless Cream Separator Co., and all others who have or may be making, selling or using Cream Separators Containing "Disc" bowl construction infringing United States Letters Patent No. 892,999.

We have previously announced the bringing of suit by THE DE LAVAL SEPARATOR COMPANY against the STANDARD SEPARATOR CO., for infringement of LETTERS PATENT NO. 892,999 in the manufacture and sale of cream separators covered by the claims of said letters patent, and the fact of infringing separators made by the STANDARD SEPARATOR CO. being sold by various other concerns under several different names.

We now beg to announce, for the information and caution of all whom it may concern, that further suits for infringement of this patent have likewise been begun in the UNITED STATES CIRCUIT COURT against the IOWA DAIRY SEPARATOR CO. and the PEERLESS CREAM SEPARATOR CO., both of Waterloo, Ia.

Separators made by one or both of said IOWA and PEERLESS Companies have been or are being sold under different names by the RACINE-SATTLEY CO. of Omaha, Neb.; the HANFORD PRODUCE CO. of Sioux City, Ia.; the L. A. WATKINS MERCHANDISE CO. of Denver, Colo., and several other concerns whose names are not mentioned either because conclusive evidence has not yet been obtained against them or because of their expressed determination to get out of the separator business.

All separators containing such infringing Disc construction sold by any of these concerns, or anyone else, equally infringe said letters patent as if actually sold by the STANDARD, IOWA or PEERLESS Companies under their own names, and all of these concerns are equally liable for such infringement.

Likewise is EVERY USER of any such infringing separator bought of any of these parties or anyone else liable to the DE LAVAL COMPANY for all income or profit derived from the use thereof.

The caution is again repeated that there are STILL OTHER CONCERNS infringing this and other DE LAVAL owned patents who will be held accountable in due course.

expenditure of close to a hundred dollars a head on the ranch. They are only themselves and at this cost he could have had a herd of registered cattle had he bought youngsters that would represent something of value when he was ready to sell out. The surplus calves when pure bred from a hundred cows represent a money value nearly equal to the butter of the herd. There always seems to be room for a calf or two extra to be fed until it is a yearling when it will represent a selling value of $75.00 or more a head. I would advise every one to buy at least a trio of the breed they like best of dairy stock and work toward making a registered herd.—M. E. Sherman.

SWINE IN AMERICA.

The most complete book on swine, published, is "Swine in America," just from the press of Orange-Judd Co. of New York, and written by F. D. Coburn, secretary of the State Department of Agriculture of Kansas. It is a book of over six hundred pages, has a complete index on every topic in the book which covers the whole range of swine husbandry. The book is profusely illustrated. Regarding these illustrations the author says: "It may be said by the censorious that they exaggerate; that they are overdone and that there never were animals so nearly perfect as the illustrations represent. There is but a measure of truth in this and persons familiar with the foremost animals of different breeds know there have been and are innumerable individuals equal if not superior to any in pictures drawn or published in good faith. These pictures are not presented as illustrations of what more than a rare few are likely to equal, but rather that students and the ambitious may observe the degree of perfection to which improvement can be and has been pushed and to be assured that similar achievements are possible because such possibilities have already been demonstrated."

The book opens with the principal kinds and distribution of swine in America. Referring to the table given in this first chapter we may say that in the twelve states of the Union which possess more than one million hogs, California is not classed with the "also ran." Though as a fact this state comes in the next class, which is from five hundred thousand to one million hogs. The greatest hog state in the country, and more than double that of any other state, is Iowa, with the enormous number of 8,413,000 swine. The great hog buying and packing interests are touched upon but more as an incident in the book. The breeder and breeding and the various breeds and types occupies more space. Practical points in breeding are given especial attention and, of course, pasturing, soil, feed and especial reference to alfalfa as a swine food, are all given most thorough treatment.

The housing and problem of pens and corrals is not only fully described but fully illustrated with many most valuable suggestions. Sanitation is also given thorough treatment in one full chapter. Slaughtering and curing of the meat with methods of handling and cutting up are also described. Diseases and method of treatment closes the book.

In the introduction, which is written by Prof. W. A. Henry of the University of Wisconsin, Prof. Henry says: "Mr. Coburn occupies a large place in the hearts of American farmers—a place peculiarly his own, for there is none other just like him. He has given us other books, but this will, without doubt, be what those who are learned would call his magnum opus, which is simply Latin for "greatest work." Since Mr. Coburn writes in good, substantial English, that everybody can understand, this is probably the only Latin that will appear in the book."

The Cultivator will be glad to secure the book for its patrons.

SUGAR BEET FEEDING VALUE

Sugar beets, like other root crops, make an excellent addition to foods for cattle, sheep and pigs. They are succulent and nutritious, keep well over winter and form a welcome addition to the dry food of stock, keeping the animals in good health and maintaining the flow of milk. The following table shows the comparative feeding value of sugar beets, mangels and silage:

	Dry matter	Protein	Carbohydrates	Fat
Sugar beets	13.5	1.1	10.2	0.1
Mangels	9.1	1.1	5.4	0.1
Silage	20.9	0.9	11.3	0.7

This table shows that as far as chemical composition is concerned, sugar beets are somewhat richer than mangels, although experiments have indicated that all common root crops are equally valuable as food for animals if equally palatable. The beets are not so rich in total food constituents as green corn fodder and silage, but it must be borne in mind that the beets are practically completely digestible, while only from two-thirds to three-fourths of the dry matter of corn fodder and silage is digestible.

The feeding value of sugar beets has been demonstrated in experiments at many of the stations. At the Wyoming station, sugar beets and alfalfa hay, and grain and alfalfa hay were compared during the winter on steers and sheep with the result that the animals fed sugar beets and hay gave better returns than those fed grain and hay or hay alone. In these experiments, the steers were fed 14 lbs. of sugar beets per head per day and all the hay they would eat.

Sugar beets, if fed in excessive amounts, may induce scouring. Extended experiments in Denmark have indicated that roots of any kind should not constitute more than 40 per cent of the ration of pigs. It is probable that this proportion should not be exceeded with other animals, although larger proportions have been fed to cows without injurious effects.—Farmers Bulletin 84, U. S. Dept. Agriculture.

VALUABLE CATALOGUE.

One of the most valuable catalogues of seeds and plants we have seen is that of Theodore Payne, seedman, 345 South Main St., Los Angeles. There are others more elaborately printed but for genuine, carefully edited information with full description of the plant in question, we have seen none which surpasses it. For instance, under eucalypt we may be permitted to copy one paragraph as follows:

E. viminalis. "Manna Gum." In Australia this tree has attained a height of 300 feet with a diameter of 15 feet. It is an exceedingly handsome tree with long pendulous branches and is one of the most picturesque for avenue planting. In rapidity of growth it ranks next to the "Blue Gum." It thrives near the coast and also in the irrigated sections on the deserts of California and Arizona. The wood is useful for shingles, rough building purposes, and fuel.

Nearly every plant touched upon is handled in almost as complete a way. The book is only forty pages but is as full of information as an egg is of meat. It is well worth writing Mr. Payne and requesting a copy.

A harness oiled as it should be needs very few repairs.

EUREKA Harness Oil

IS THE BERKSHIRE THE BEST.

Prof. Hoffman of the Iowa Agricultural College thinks the Berkshire is superior, but is it?

The professor says:

There are hogs, big, little, red, black, white and mixed, a large field to select from, but to the thinking farmer it is often a question as to which breed is the best. First one kind is tried, then another, then, perhaps, an outcross, with the result that correct impressions regarding the final results are impossible.

The only correct way is to try the different breeds and crosses under like conditions, and for two or three years in succession. This is absolutely the only way to determine the best hog.

To have the different breeds under the same conditions as regards climate, feed, quarters and care, you may then be sure of the final result, which will be that under all conditions such as named before, the Berkshire hog will give the best results when it comes to making the most money from the least care and feed.

In repeated trials it has been shown that the Berkshire hog is one of the most prolific of all the breeds. This means the largest number of pigs from a limited number of sows. From the start the Berkshire hog is healthy and vigorous, making excellent gains, and on corn, grass and pure water will weigh from 225 to 300 pounds at 8 to 10 months of age, and at maturity will weigh from 600 to 1000 pounds.

In several experiments, according to "Feeds and Feeding," the Berkshire hog requires from 15 to 75 pounds of feed less to make 100 pounds gain in live weight than did either the Poland-China, Duroc-Jersey, Chester White or Yorkshire that was used in the same experiment. These experiments were made in Massachusetts, Vermont, Michigan, Wisconsin and Canada, with different feeds and under different conditions, with the result that the Berkshire gains were the most acceptable.

My own experience of seven years with hogs have led me to breed "the Berkshire hog" as the most profitable of all breeds.

Six years ago it was my pleasure as well as profit to have in charge the six different breeds of hogs at the Iowa Agricultural College. Here the hogs were given the same care and feed. In my observations of the different breeds I found that the Berkshire hog was always ready for the feed, good at taking care of himself with cattle and made the most of the pastures. They always looked the sleekest and the scales showed that they were doing the best.

From the college I went to Illinois and took charge of one of the largest and best herds of Poland-China in the world. This herd contained some of the finest and highest-priced Poland-Chinas in the country, but six months of actual contact, day and night, with this herd only fixed more firmly in my mind that the Berkshire hog was the best of them all.

Since farming for myself, I have had in the feed lot Poland-Chinas, Chester Whites, Duroc-Jerseys and the Yorkshires, alongside of the Berkshire hog of my own breeding. I never had a Berk that went down on his back, trampled by the steers or run over by the wagon, and, when it came to marketing I found that the Berkshire hog was the first that was ready for the market.

ALFALFA OR CLOVER HAY FOR BROOD SOWS.

Brood sows in the corn belt have ordinarily been wintered on corn, either fed direct or through the droppings of cattle.

Corn does not furnish the proper raw material for an animal that is expected to produce a large litter of healthy pigs. It is deficient in bone and muscle-making material. Corn is pre-eminently a fattening feed, but is not an economical flesh former.

This difficulty may be obviated by feeding oats or oil meal. The oats this year, however, are high in price. Shorts are also high in price. Hence, oil meal is perhaps the cheapest supplementary feed that can be obtained; but it has to be bought. Ordinarily many will not buy the oil meal but keep on feeding corn, apparently at a profit but really at a great loss.

Where it is obtainable, alfalfa hay is the cheapest supplementary feed that can be given the brood sow. The second best is clover hay, which can be had on almost every farm. I know of one or two instances where brood sows were fed through the winter nothing but alfalfa hay, and with the very best results—large and healthy litters.

Clover hay is not as good as alfalfa hay for brood sows for the reason that it is not as rich in protein, or in ash. Brood sows, however, will eat a very large amount of it if it is cut early and well cured, and they are given the opportunity.

Those who are feeding their brood sows corn only should quit it. Feed them alfalfa or clover hay. Put it in a rack, low down, as if for sheep, and feed them sparingly on corn. Give them some shorts if you can get it. Where alfalfa or clover hay is not obtainable, try alfalfa meal mixed with corn. In some way or other the brood sows must be given a properly balanced ration if large and healthy litters of pigs are expected. In other words, the raw material must have the proper relation to the finished product.—Successful Farming.

TEACHING THE YOUNG CALF TO DRINK.

Take a stooping position in front of the calf and give it the fingers of one hand to suck, holding the pail of milk with the other hand. When the calf starts to sucking at the fingers gradually lower the hand towards the milk. If the calf follows the fingers into the milk hold the hand there a bit until the calf starts to drinking, then take the fingers out of its mouth. When it lifts its head out repeat the operation, keeping this up until it seems to know where the milk is and how it is to be gotten at. Getting the calf's head into the pail the first time is usually the hard part of the operation. Once this is accomplished the rest will be comparatively easy.—Successful Farming.

Stop and think about the water supply. It should be secured from a source uncontaminated by impurities.

To estimate the number of tons of hay in the mow, find the cubic contents of the mow and divide the number by 500. This rule gives only approximate results, since the more compact the hay is the more weight it will have and the looser hay is the lighter it will be.

1908 hops are selling at Portland at 9 cents.

U.S. 1909 UNITED STATES 1909

OUR SIDE OF THE QUESTION

The United States Separator has built up a **reputation** for **efficiency** and **durability** that makes it the **foremost** machine from every standpoint of separator requirements.

We **prize** that **reputation** and in the changes we have made for 1909 every feature that has helped to make the United States famous as the **reliable separator has been** retained.

Every **improvement** that has been made has been made with the object of **building up** and adding to that reputation.

We have added **"working points"** and not fancy "talking points."

YOUR SIDE OF THE QUESTION

You buy a **Cream Separator,** not on account of some "fancy talking points," but because it will enable you to handle your dairy product **more easily** and with **greater profit.**

A machine that will handle more milk. That will skim it more thoroughly. That will lose least in bowl flushing and that can be kept clean and sanitary with the least trouble.

These are **your** requirements, and a trial will **convince you** that the **latest model** U. S. embodies **all** of these **essential** features, to a **greater extent** than has ever before been reached in Separator construction.

MORRIS & SNOW SEED CO. 425 So. Main Street Los Angeles, Cal.

Small Fruits and Vegetables

ASPARAGUS CULTURE.

ONE of the best and easiest grown of our garden perennials is the asparagus plant. It can be started either from seed or from plants. If one wishes to raise plants to sell, it is better, of course, to plant the seed, but if asparagus is wanted for home or market use, in the shortest time possible, it is better to set out yearling seedlings.

It is important, in laying out the asparagus plantation, to select a place where it can remain permanently for if taken proper care of, the plantation will last for twenty years. The old idea was the asparagus "bed," the new is to plant in rows the same as corn, etc., so that for the market garden the cultivation can be done by horse. The land selected should be a deep, rich, fertile, moist and cool soil, having a warm exposure, a gradual southern slope being preferred. If the land is originally hard and coarse, it should be worked a year or two in advance by the raising of some thoroughly tilled crop, using as much manure as possible in the process. Late, deep fall plowing is preferable, turning under a thick covering of well rotted manure. In the spring when the frost is out of the ground, plow furrows from six to ten inches deep and four feet apart. If the soil is not of the best quality, two or three inches of well rotted manure should be placed in the bottom of each trench and on this add a couple of inches of loose soil. Then, place the plants in the trench three feet apart. Cover with three inches of earth, it not being well to cover deeper, as it takes too long for the young shoots to push their way through. As the shoots grow the rest of the earth can be filled in around them by after cultivation. When filled in, the crowns of the plants should be about six inches below the surface of the ground, for if planted much less the roots will push up to the surface and interfere with cultivation.

If asparagus seed is to be planted, it should not be more than one year old, as the germinating per cent. of older seed is low. Soaking the seed several hours in warm water enables germination to take place sooner, as ordinarily it takes about six weeks for the plants to come up. The seed is planted by the garden seed drill, in rows about eighteen inches apart. When the plants are up, thin out to about four inches in the row. It is well to sow radish seed with asparagus, as the radish will come up much quicker than the asparagus and enable one to detect the rows for weeding. The radishes can be pulled without interfering with the asparagus, as they can be matured before the asparagus reaches any height. The seedlings are set out the next year.

As the asparagus is a gross feeder, it is well to mulch in the fall with more or less well rotted manure, although straw and leaves will do. Before mulching, the old stalks should be cut and carried away, and, if, affected with rust, should be burned. In early spring the straw and undecayed leaves should be removed, and about the last of June cover with a good coating of well rotted manure and cultivate in. Very little cutting should be done until two years after setting out, and then the cutting should not be carried on later than July first, as the plants need to grow in order to store up a food supply for the next year's growth. In cutting the asparagus for use, a sharp, square pointed knife should be used, and a straight, downward cut made just underneath the surface of the ground, care being taken not to injure the unseen shoots.

Where plants are affected with rust, spray with soap Bordeaux mixture, which is made up of four pounds copper sulphate, four pounds of fresh stone lime to 40 gallons of water adding four pounds of dissolved laundry soap. As a prevention, destroy all stray plants affected with rust in the vicinity. Asparagus can be forced in winter in cellars, or hotbeds by using the roots of old plants; but these generally die after this kind of treatment. It is advisable only to use plants from an old field which is to be plowed up.

Some of the best varieties are: Early Argenteuil, Conover's Colossal, Palmetto, and Columbian Mammoth White.—R. S. Herrick.

SCREENS FOR CABBAGE SEED BEDS.

A year ago the growers of cabbage plants suffered severe losses from the ravages of flee beetles which ate little round holes in the seed leaves, causing them to shrivel and the plants to die. The beetles causing this injury are tiny, black insects, which have the habit of dropping to the ground, or pumping from the plants when disturbed. They delight in bright sunshine and the most severe injury is done on warm, sunny days.

Turnips and radishes are also attacked. Some years it is almost impossible to get a stand of these vegetables.

In the open garden some relief can be obtained by dusting the leaves of the young plants with air-slacked lime, or better, with insect powder. The latter remedy is rather expensive, but a very good one in small garden patches.

When cabbage plants are raised in beds, either in hot beds or the garden, the beetles may be kept from them by the use of screens made from cheese cloth. A light wooden frame should be made, extending about two feet above the surface of the bed. The cheese cloth is stretched over this, extending to the ground on all sides. The edges that touch the ground may be lightly covered with earth to prevent the beetles from finding their way beneath. The cost of this method of protection will be in the neighborhood of twenty cents for each thousand plants raised.—S. Arthur Johnson, Colorado Agricultural College.

Potatoes at Tacoma, Wash., are selling at $35.00 per ton.

The Ornamental Garden

HOW TO GROW ROSES.

To grow roses successfully one need not be an expert gardener, but conditions of soil, planting and care must be observed. Roses do not necessarily need a rich soil. Heavy or clay soils are not as well adapted to roses as loam or sandy soils, but even in the latter the matter of good drainage must not be neglected. Granite soil needs enriching and plenty of cultivation, and the the heavier black soil needs mulching with coarse stable manure. We must use our judgment and common sense at the outset, and see that the bushes we buy have a fair start. If you have a loose, loamy soil, well and good; but if not, then spade and fork in well a good quantity of stable manure, and if possible add a load or two of river sand. See that it drains well after a rain. A soggy soil is not good for roses. Commercial fertilizers are an excellent help to poor soils, and are always the best to use, as they have no seeds in them which will later produce an abundance of weeds.

Having bought your roses, preferably two-year-old plants, mark out your ground so as to give the roses plenty of room, three or four feet apart each way, four is the better distance, as you do not want to move your bushes when they are six or seven years old. If possible learn something of the habits of growth of your bushes, and put the climbers where they can be trained up, and the more rapid growers of the bush roses alternating with those of slower growth. Hedges of any one variety are very effective and also very much in vogue.

Having marked out your ground, make holes about eight inches across and deep enough to cover the root depth of the plant you have marked for that spot. Spread the roots so as to give them as much chance as possible to get a large amount of moisture from the earth. Plant the roses a little deeper than the marks shown on the bush, as the soil will usually settle a little. Fill the hole level with the top of the ground and press firmly around the stalk. If there is any dead wood, be sure to cut it off, and it will do no harm, if the bush is large, to cut back a few inches of the live wood, so as to make it easier for the rose to start its growth, in the new location. If your planting is done in February or March no watering may be necessary, but if the ground is dry it must be kept moist by watering each day in the evening. The small rose bushes, 1-year-old cuttings, which are sold 15 or 20 for a dollar, do not require as large a hole for planting, but otherwise they require the same care. Those who desire to grow roses from cuttings can do so by obtaining the cuttings in December or when dormant, and setting them out in a cool, shady place until they are well rooted. A great many varieties are easily grown from cuttings. Most of the 2-year-old roses are budded on wild stock. When your roses begin to grow, watch for any wild shoots, and as soon as you are sure as to their nature, nip them off close to the parent stalk. If allowed to grow, they will act as suckers and retard the growth of the true rose. One-year-old bushes should only blossom sparingly. A little sacrifice the first year will be more than repaid by finer roses and better development of the plants themselves in the second year. Some roses will stand more sun than others, and you must therefore watch your bushes and if your first location is not right, change to the one which seems better suited. All roses need sunshine and do not like to be crowded. Cut out all puny or sickly wood at any time of the year, and when you are doing your Spring pruning leave only the stocky and vigorous branches, and prune for an open bush. Use common sense and keep your eyes open, and your experience will soon teach you the rest. Remember the old adage: "If at first you don't succeed, try, try again."—Portland, Oregonian.

A MORE BEAUTIFUL AMERICA.

In an address on beautifying American scenery, President McFarland of the American Civic Association said:

"It is not surprising that the path which broadens into the betterment and beauty of our ideal America is alive with the thorns of thoughtlessness and indifference, and that there are in the way not only the rocks of ignorance and custom, but the fighting giants of selfish private interest and entrenched special privilege. The practical civic warriors who tread this anything but sympathetic and easy way seldom meet direct hostility to the end in view, but they do encounter constantly sharp resistance to definite progress toward that end.

"The billboard man, the producer of wasteful black smoke, the Niagara power promoter, the careless miner and lumberman, the erector of the network of wires—all these will subscribe promptly to the doctrine of 'a better and more beautiful America,' but they as promptly fall afoul of the progress toward that end which interferes in the least with their gainful occupations.

"Under this condition, the work of the association necessarily must be definite and practical to succeed. It must and it does educate the men and the interests it seeks to change into factors for the public good, endeavoring to have them see their greater advantage in promoting the health, happiness, and efficiency of all. Aside from that mushroom of advertising, that parasite upon legitimate business, the billboard horror, every interest touched by the uplifting work of the American Civic Association is directly benefited, not only in the immediate economic result, but in the general sum of increased human efficiency. The factory owner whose chimneys have been rendered smokeless can contemplate the saving in coal, while he himself breathes with pleasure the purer air that results. The corporate owners of the mazes of overhead wires are not insensible to the beauty of the poleless highways any more than they are regardless of the largely decreased cost of maintenance which results when they have been forced to put their wires underground.

"Therefore, our work is strong in education, in inquiry, in suggestions and co-operation, in dealing with those who are, mostly through no definite thought of wrong, in the way of an advance toward the more beautiful and the more efficient America."

CRIMSON WINTER RHUBARB

General Agriculture

A BIT OF GRANGE HISTORY.

THE FORTNIGHTLY Club at Redlands is made up of a body of live people who discuss live topics at its fortnightly meetings. One of these topics at a recent meeting was a history of the organiaztion of the Patrons of Husbandry. The leader in the discussion was Thomas T. Smith and from his address we quote:

Farmers Clubs.

Prior to 1868 there was nothing in this country except farmers' clubs. They were local in character, had no connection with each other, were organized to discuss purely agricultural questions and were composed entirely of men. The conditions of life in the country, with broad acres between homes, led necessarily to a restricted social circle, and social life was lived in narrow limits, especially in the northern part of our country.

The farmers' club did not broaden the life of the farmers' family. In January, 1866, Mr. O. H. Kelley, a farmer of Minnesota, was sent south to investigate and report on the agricultural conditions.

To his mind "The people of the north and the south must know each other as members of the same great family, and all sectionalism be abolished." As a member of the Masonic fraternity he was most cordially received. Mr. Kelley says in writing to a niece in the north he mentioned "the idea of a Secret Society of Agriculturists as an element to restore kindly feelings among the people." She replied expressing great sympathy for the women of the south, and much encouraged my suggestion that an organization of the farmers of the country might prove a blessing. "The idea of association was fast getting fixed in my mind, and I remember comparing the Mississippi and its tributaries to a national organization and its subordinates."

Devastation Follows the Lumbermen.

National in Scope.

The idea of a national organiaztion of farmers having taken possession of Mr. Kelley's mind in the spring of 1866, he kept turning it over as time advaneed and in 1867 began to talk about it with some of his associates in Washington, among others, William Saunders, connected with the Department of Agriculture who joined in developing the idea. He says: "In traveling about the country, I noted a lack of interest on the part of farmers towards progressive agriculture. I found the circulation of purely agricultural papers was but one to every two hundred and thirty inhabitants, and libraries of fifty bound volumes were exceptions."

In preparing the way for effective organization printer's ink was used, and a circular was sent to men engaged in agriculture in different states.

This was done in February, 1868. That same year the work of organization commenced and continued actively for a number of years until it was planted in every state in the union. In the seventies it reached its greatest numerical strength. It was incorporated in 1876 under the laws of Kentucky which state passed "An act to incorporate the National Grange of the Patrons of Husbandry" in Dec., 1875.

Took Up Transportation.

It was about 1873 when the open conflict between the people and the transportation companies began in the west by the passing of laws in Illinois, I think, regulating rates of fare. The companies resisted and the matter went to the courts. At that time popular feeling ran high and organization was rapid. The people seemed to think they could remedy all their ills by legislation and a political organization of farmers was organized in Illinois by a Mr. Smith which attained quite a membership, and called a convention to meet in Chicago in September, 1873, and was attended by men from several states, including New York, Nebraska and Minnesota. Nothing, however, was accomplished and the organization died.

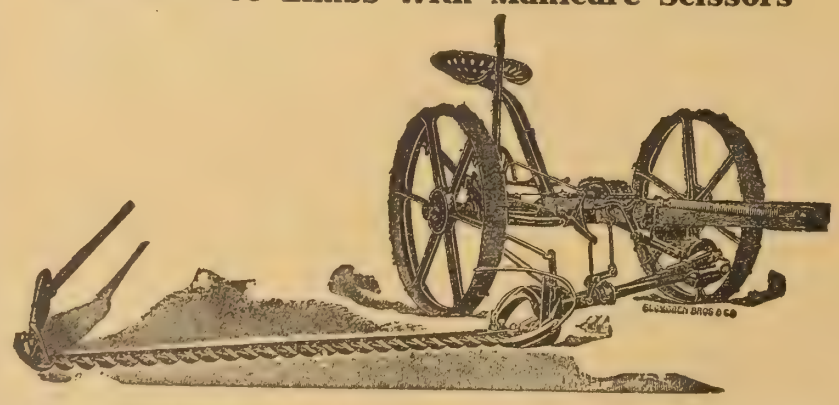
The Grange of the Patrons of Husbandry however lives on and to it was attributed, by many, the activities of the political organization. As the years rolled on and the farmers found that passing a law did not correct a wrong they looked to political organization again to right matters, rather than by the slower process of education which the grange advocated, and

Did You Ever Stop to Think

That the Lightest Looking Mower Is Very Apt to Cut Heaviest;

ALSO

That Only a Very Foolish Person Will Try to Cut Tree Limbs with Manicure Scissors



The New Standard Mower

All power in a Mower originates from the grip of the wheels on the ground,—the firmer the grip the greater the cutting power.

The 5-foot New Standard Mower weighs 825 pounds. The entire weight of the cutter bar (while cutting) is transferred through the suspension spring to the main wheels. The bar is neither pulled nor pushed,—it is carried—an exclusive Standard feature.

The power thus secured is transferred to the gearing through the mechanically perfect wheels, found only on the New Standard Mower. The gearing develops high speed without undue strain and passes the power to the knife. The knife works in our famous curved Cutter Bar,—the only frictionless knife channel made.

These are a few reasons why the New Standard Mower is the most powerful cutting mower made.

A folder giving full detailed description of the New Standard Mower and our other Haying Tools will be mailed free on application.

Newell Mathews Co.
200 North Los Angeles Street
Los Angeles, California

The Farmers' Alliance was formed and existed in the Middle Western states and held its own for a number of years and drew largely from the membership of the grange. Very many of the subordinate granges closed their doors throughout that section. The grange however worked on in its quiet way.

ARID AGRICULTURE.

The latest addition to agricultural literature of the West, is "Arid Agriculture," a hand book for the Western farmer and stock-man, written and published by B. C. Buffum; Manager of the Wyoming Plant and Seed Breeding Company, Worland, Wyoming. The purpose and scope of the book is given in the "Foreword." "The purpose of this volume is to furnish plain facts in a plain way about the practice of agriculture in the arid region. Whatever its shortcomings, the reading matter here presented is new and original. It has been carved out of a quarter century of experience, observation and study in the dry parts of the West. No attempt has been made to compile scientific data or write a cyclopedia. We have tried to present enough of the practice and underlying principles of arid farming to enable any intelligent man to 'make good' on a Western farm. We feel that this book will, in a measure, meet a 'crying need of the hour.' The West is now rapidly settling up with new farmers and new stockmen whose measure of success is proportional to the quick and reliable information they are able to obtain. Books on agriculture written from the viewpoint of the farmer or scientist in the humid East, generally are good books, but they do not supply the arid farmer with the most important facts. In the present book we try to give some idea of soil tillage and crop production in the arid region."

The book is not given entirely to dry farming and its principles, though that science is given the first and greatest attention. After discussion of dry farming, irrigation and crops for such conditions, some space is given to crop destroyers, to live stock and to home building.

The farmer who is bringing his land to the best tillage and doing it under arid conditions, will find much of interest in Prof. Buffum's book.

SPRINGS IN CALIFORNIA.

If Yellowstone Park, which contains so many geysers and other hot springs, is left out of consideration, California ranks as the first State in the Union in respect to the number and variety of its springs. Many of these springs find their most important use for irrigation, many others are well-known resorts, and still others, which have not been exploited, yield waters whose curative properties are probably as valuable as those of the famous springs of Germany.

In connection with its study of the underground waters of California, the United States Geological Survey has undertaken to make a systematic investigation not only of springs used as resorts and of those whose waters are bottled for table or medicinal use, but especially of those that are large enough to be the source of water for irrigation. For this purpose the southern half of the State was examined during the fall of 1908; the northern half will probably be studied during the coming summer.

ALFILARIA AS A FORAGE PLANT.

One of the principal lines of experiment station work in the Southwest is the study of various forage plants, either introduced or indigenous, as means of restoring the overstocked range or otherwise increasing the forage production of the grazing areas. During the last five years the problem of range improvement has received particular attention in Arizona, where the experiment station, working partly in co-operation with this Department, has secured results showing the practicability of improving the ranges by the introduction of forage plants adapted to the region, by encouraging the dissemination of all species of economic value, and by proper management in general.

Of the introduced plants, alfilaria, also known as alfilerilla, filaree, pin clover, etc., is so well adapted to the prevailing climatic conditions and has proved itself of such great value as a range plant that it is considered as ranking first in merit. The plant is a native of the Mediterranean region and was presumably introduced into California by the early Spanish explorers. It is at present permanently established in Oregon, California, Nevada, Arizona, New Mexico, Utah, and parts of Washington, Idaho, and Texas, an area having generally mild climate.

The Farmer's Union of Washington is attempting to force a "terminal rate" for Pullman, Wash.

MARKING NAME ON STEEL TOOLS

It's easy. Just take a little tallow or beeswax, belt it and spread over the place on which you want your name. Write the name down through the wax with a big needle or awl and pour a few drops of nitric acid over the letters you have made. Leave for a few moments, then wipe off the wax and your name will be on the year after year, without every little while making deposits which should give them a working balance. The same principle applies in agriculture, and the farmer who is succeeding now, and who is to succeed in the future, either in America or any other country, is the one who deposits the elements of fertility in the soil, as he deposits money in the bank, in greater amount than he draws out.—Iowa Homestead.

California Farm Names

REGARDING the registration, or securing copyright privileges for farm names under the act recently passed by our state legislature and later signed by the Governor, we quote as follows from a letter from Secretary of State Curry:

"We have not yet drawn up a particular form for registering farm names. This act does not take effect until sixty days from Mar. 8, 1909, the day of its approval. The form, if we decide to make up a special form for such, will be about the same as the ordinary form. Enclosed please find our regular form for registering trade marks. In a few days, we will write you more definitely about the matter. This new law, as far as we can ascertain, is for the purpose of allowing a person to register for exclusive use a farm name without reference to protecting the farm name merely in connection with products raised on such farm. The law as it was previously, would protect the farm name as a trade mark for products raised upon such place."

As we understand it, this law is merely an amendment to one formerly passed and gives but little additional privilege and secured under the other excepting in application of the name to the farm. Accompanying the letter from the Secretary of State was a blank used in making application for the trade mark, as may be seen in the quotation given above from the letter it is possible this same form may be used. If not, the Secretary will have proper forms printed in due time. It will be noticed that the act does not take effect until sixty days from March 8th, which leaves some two or three weeks from this time before application may be made. As noted, the Secretary of State will give our subscribers further information as soon as the line of procedure is definitely established. It is evident, however, that the first step to take in the matter of securing this privilege will be the application filed with the Secretary of State for blanks.

We trust this act will give an impetus to this delightful custom and are sure that where a ranch is determined to make a record for putting up a fine pack of fruit that such name may be made of real commercial value to the ranch.

Amongst the names recently sent in we may quote the following:

"Greenwood Ranch," owner, C. E. Garrett, Hynes, Los Angeles county, California.

"Highland Home," owner, John Carlson, Selma, Fresno county, California. Mr. Carlson writes: "I am much in favor of the agitation for naming of farms. I think it will receive an impetus from the fact as you mention of the enactment of a law providing protection for the name. We have named our place "Highland Home." It is a forty acre tract and is two miles north of Kingsburg and three miles southeast of Selma. The name is descriptive, as the buildings are erected on a slightly knoll or high plateau in the center of the place. We have a fine view all over the surrounding country, of which the Sierra Nevada mountains form the background. Our products are fruit and poultry. I find the Cultivator a most instructive and useful paper and wish it to come to our ranch home, so ask the address to be changed to simply "Highland Home," Selma, California."

"The Four Waters," owner, Capt. H. Anlauf, Santa Paula, Ventura county. Capt. Anlauf writes: "The reason why I named my ranch 'The Four Waters' is because there is supplied from mountain springs almost all pure snow water. From these springs we irrigate one of the most beautiful orange groves in the state, located about five miles north of beautiful Santa Paula. In addition we have a flowing oil well which also produces sufficient gas for lighting, cooking, and heating, which is manipulated under the most scientific arrangement. Topographically this ranch, of one hundred and fifty-eight acres, is so formed by nature and snuggled in the mountains that it is practically without wind, fog, and frost. For the last thirteen years since established, has required no fumigating, spraying nor fertilizing and never required any frost protection. With a new house to be built this summer and a several thousand dollar orange crop just sold on the trees, we are a happy family on 'The Four Waters.'"

"Rancho Kielyenso," owner, Wm. Kiely, Lawrence, Santa Clara county.

"The Louisiana," owner, F. A. Louis, Lankershim, Los Angeles county. Mr. Louis has a variety of fine fruit in the center of the beautiful and fertile San Fernando valley with grand mountain scenery to the north three miles distant. He highly appreciates the serviceable feature of the Cultivator in encouraging naming of the farm. He has selected the name "Louisiana," which includes his own name.

"Shasta View," owner, J. H. Walker, Olinda, Shasta county. "Shasta View" is a berry and poultry ranch and writes the Cultivator on neatly printed stationery.

"Black Mountain Ranch," owners, Warriner & Son, La Mesa, San Diego county. Messrs. Warriner & Son write on stationery at the head of which is a half-tone illustration of the ranch packing house and are interested to know of the steps to take to secure a copyright privilege.

Under a Covina Umbrella Tree.

TROUBLESOME SAGE-BRUSH.

Destroying sage-brush is a tough problem for the new-comer into irrigation districts.

Much interest has been aroused in the various parts of the West about the appearance of a new attachment which can be used for cutting off the sage-brush about four inches below the surface.

It consists of three parts. Two steel blades and an upright. The latter is tough spring steel, one-half inch thick, five inches wide and 30 inches high. The front edge is sharp. Two keen edged blades or knives are bolted to the bottom. These extend right and left like wings at a sharp angle, and are 30 inches long.

This attachment is tied to the pole of the 20th Century Grader, a machine which is now very popular in the irrigation districts for cutting and cleaning laterals, and making shallow ditches. Also for land leveling, border making, road grading, seed bed making, etc.

People who have seen this attachment say it is just the thing. "Now we can grade, level, ditch and cut sage brush with this one machine."

The Baker Mfg. Company, 731 Fisher Building, Chicago, Ill., are sending out a brand new catalog full of pictures, showing ditching scenes, giving articles on farm drainage and irrigation work, and excellent articles on road grading, etc. This catalog is free and will be sent promptly on request.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

POULTRY RAISING FROM A WOMAN'S STANDPOINT.

We have just completed our breeding pens for another season. We always enjoy this work of selecting and mating our breeding pens about as much as any one part of the business. Especially is this true if one has some particularly nice birds to place in these pens. It is always very interesting to a true fancier to select and mate with an idea of best results from his own birds. The male must be selected with the idea of strengthening any weak points of his females, and the females must be selected to help out the same in the male. Of course, if one is so fortunate as to have birds with no weak points, it will not be so much of a task to select one's breeding pens, but very few of us are so fortunate, the ads of a amateur, and by this I mean to say, one who has never had the least experience with small chickens, to start with eggs. They may hatch the chicks all right, the modern method of incubating makes this matter of hatching very simple, but when it comes to raising the little fellows it is quite a different matter. Often a party has purchased the complete outfit, incubator, brooder and eggs, and has taken off a very good and satisfactory hatch, but before the third week all of the chicks have succumbed to the fatal disease, "ignorance," and the beginner has nothing left but the outfit and the experience. For this reason, I think, perhaps, it is wiser to start with a small flock and hatch your owns eggs, as you are sure to have the flock left, and have them to fall back upon. Then, again, they

Classy Mediterraneans.

number of prominent breeders notwithstanding.

As yet no breeder has ever succeeded in raising a perfect specimen, and when this comes to pass to us the pleasure of poultry breeding will have lost all of its delight. It is the striving to better one's flock, year by year, and to bring them as near the perfection mark as possible that is so entrancing. And for this reason I say that the mating of the breeding pens is one of the most interesting features of the business. A good many well-known breeders employ poultry judges to mate their pens, but when they do this they lose a good bit of pleasure and interest in their birds. It makes the work interesting all the year noting the results of the matings. It is interesting to watch the chicks from different matings develop and to note which are making the best birds.

The question is often asked, "Which is the cheapest and best way to start, with stock or eggs?"

This all depends upon the experience the beginner has had and the conditions under which they will operate. I never feel like advising an will lay enough eggs to help buy the grain required by the growing chicks as well as for themselves. If one has had any experience with feeding and caring for small chicks, or even if one has not, but is not afflicted with know-it-all and is willing to profit by the experience of those older in the work, they will succeed with eggs. It is a strange feature of this "hen fever" that nearly all who contract the fever are afflicted with a symptom that is very hard to combat, and that only time can cure; that is, the idea that they know just all there is to it. I speak from experience, and am frank to confess that at the end of the first year in our "career" we believed that we knew it all, and if there should happen to be any "little thing" that we had not learned it simply was not worth learning. But this symptom gradually left us year by year, until now, after having been continually in the work for fourteen years, we are very glad to have help upon various subjects relating to poultry, and always read and listen with interest to anyone's experience. If you have had any experience and wish to add new blood to your flock, it is decidedly

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. Berrar & Robertson, 103 East Santa Clara St., San Jose, Cal.

When the chicks are hatched don't feed them anything for 24 hours, then feed them the best dry Chick Feed you can get. We say that is

West Coast Chick Feed

SAMUEL R. KELLAM, former president of the L. A. Co. Poultry Association, says: "West Coast Chick Feed is the best feed for young chicks I have ever used. I have given this feed a thorough test, and have always found that it produced fine, large, healthy chicks."

MRS. A. BASLEY, the celebrated poultry authority, says. "I want some more of your West Coast Chick Feed, for it is excellent. It is purer, cleaner and appears better balanced than other feed I had been using, and to tell the truth, I have been experimenting, feeding both together, and they always eat yours in preference."

Ask your neighbors, for there is more of "West Coast" sold in Southern California than all other kinds put together. If not sold by your dealer send us $3.50 and we will send a 100 lb. sack, freight prepaid within 300 miles.

Single Comb White Leghorns

The first essential to success in the poultry business is that the foundation stock or eggs be purchased from a reliable breeder, one who has made a success of the poultry business from the fact that his stock has proven to be the Business Hen. Such stock or eggs we now offer you and stand back of our sales. Prices for stock or application. Correspondence solicited.
Eggs—$1.50 per 15, $7.00 per 100 and $60.00 per 1000.

STUHR-WILLIAMSON POULTRY CO.
378 Bandini Ave. Home Phone 1490 RIVERSIDE, CAL.

the cheapest to do so by purchasing eggs, but be sure you buy these eggs from a reliable party, one who will send you what you pay for and who does not use his own eggs for hatching his own birds, and fill his orders from eggs that he can pick up around the country. The men and women who are in this business are, as a whole, a fine lot of people, and true ladies and gentlemen, but, like all other trades, it has its imitators and crooks, and all you have to do is to sift the chaff from the good grain and you are safe.—Successful Poultry Journal.

PREVENTION OF ROUP.

The fundamental cause of roup can always be traced to filth of some kind; it may be no fault of the owner of the poultry, since the birds may eat putrid food while out on range, when visiting a neighbor's premises, or when exhibiting at some poultry show; but usually the trouble lies in the home poultry quarters, especially if the birds have not free range. The source of infection may be in the water, the feed dishes, the yard or other places where the fowls are confined; for this reason it is imperative that the premises and vessels be thoroughly cleaned as soon as any trouble is discovered. After being made pure, the whole place may be sprayed with

a 5 per cent solution of carbolic acid in water, care being taken to fill every crack, as well as the whole surface of walls, ground and floor.

The yards should be spaded up or plowed and planted to some crop, such as mustard, turnips, rape, clover, or, in fact, anything that is quick growing. If the yards are small, and the fowls would prevent the young plants from growing, one-half of the yard may be sown, and then covered with poultry netting held up from the ground about six inches by a framework of wood; the fowls can then pick the leaves as they reach the wire, but will not be able to injure the roots of the plants.

As for the affected birds it is doubtful if any remedy would pay to apply, unless they are very valuable fowls, and as long as they remain on the place the owners runs the risk of having still more fowls sick by coming in contact with them. However, whenever it is desired to save them they should at once be removed some distance from the healthy ones, fed a well-balanced ration, containing a small proportion of meat. None of the remedies recommended have been found satisfactory so long as the cause of the trouble remains, but by evaporating oil of turpentine in a close room, so that the birds will be forced to breathe the vapor, is one of the most commonly applied remedies.—New England Homestead.

Never use for breeding, fowls that are or have been afflicted with disease.

INCUBATOR DIRECTIONS.

Every incubator maker sends directions how to operate the machine he makes to every one who buys them. Presumably the man who makes an incubator knows better how to use it than any one else, but there is some room for criticism in that the directions take no count of the differences in humidity as the season varies, as the altitude changes or as the climate differs. Very often we have 60 and even 70 degrees of humidity in the vicinity of Chicago while in Nevada the weather reports show that the humidity ranges as low as 3 degrees and this extreme dry condition of the air is common over several of the far western states or a great part of them.

If moisture has anything to do with the hatching of chicks a difference of 65 or more degrees in the humidity of the air would certainly make some difference in the hatch. Our attention was called to this by Mr. Wesley Clow, of Nevada, and we are glad to be able to warn those of our readers who live in the dry sections of the country that more moisture is needed where humidity is low than where it is high. Mr. R. W. Williams is another Nevada incubator operator who uses non-moisture incubators but finds it necessary to supply moisture in order to get the best results. Those who live west of the Rocky Mountains and south of the rainy belt next to the sound country should remember that directions made for use in a humid country do not fully apply in their cases and they should supply moisture in their incubators.—Poultry.

Sex of Eggs.

I noticed recently what you said regarding determining the sex of eggs. I would like to give my theory hoping it may be tested and the results given in the Cultivator. We notice where eggs have hatched they are nearly evenly divided between the males and the females . Why are they so evenly divided.? I believe that the first half of the eggs, or those laid in the earlier part of the season are more liable to hatch pullets, while those which were laid immediately before the hen becomes broody, will produce more cockerels. In other words, to secure pullets set the eggs laid in the earlier part of the laying period. While if one wishes fryers and broilers, set the later laid eggs.—J. N. Shank, Reedly.

FEEDING GREEN BONE.

Fresh, green bone is an egg-making food that can be fed regularly and systematically at a very small cost. The bones must be green and fresh, not the dry ones that may be gathered up, or those that have come through the soup or the boiling pot. Such have parted with most of their valuable elements for egg, feather and flesh production. The ribs with particles of meat adhering are all ready to be cut up, and make the ideal food. The relish with which hens devour the product indicates the important part it is to play in the production of eggs.

When lice come in at the door of the henhouse, the profits fly out of the window.

The food and water troughs should be scalded out occasionally to kill disease germs.

LONG DISTANCE ORDERS.

Mrs. Frank Metcalf writes us that she sent thirty eggs to Honolulu, in January, and the lady who received them there reports that she got eighteen fine healthy chicks from them after their long journey. Apparently Mrs. Metcalf knows how to pack eggs. She says these were packed in a common peck basket with excelsior in the bottom and each egg rolled in cotton batting, all of which is covered with excelsior, then another layer of eggs, more excelsior and so on. Then the top is covered with muslin drawn tight over all. Apparently they had careful handling on the route.

POULTRY QUERIES.

Feeding Milk.

Is it harmful to feed to chickens, hens and growing stock, the cheese which forms on skimmed milk, without boiling or heating? Please answer the above question in your journal and very much oblige.—G. Z.

The danger would depend mainly upon what sort of vessels the said milk and cheese stood in; the acid formed by milk souring in some metal vessels, say tin and copper or brass, corrodes and forms a very virulent poison, which results in ptomaine poisoning. If fed in clean crocks or wooden utensils the danger is not so great. Moldy milk or cheese should never be fed to fowls and the safest way is to heat the sour milk to the boiling point, then mix stiff with two thirds bran to one third cornmeal in a crumbly mass.

I have soaked wheat in milk over night and brought it to the boiling point, then stiffened with the bran and meal with excellent results, but it meant work. Still if one has a large kettle on the back of the range this will heat while breakfast is being cooked, and not make extra fuel necessary.—Mrs. F. M.

Hen Died.

Will you please tell me through the columns of the Cultivator what was the matter with two of my hens. The night before they went to roost apparently perfectly well, and the next morning they came out of the henhouse looking very droopy and with pale combs. By noon they were dead.—M. C. S., Duarte.

What was in the hen-house to affect these hens in this way? Could it be that these hens roosted near a corner that was filled with millions of mites, which sucked the life-blood out of them in one night? Such things have happened and the nest of mites may be found between the joints where two boards lap rather loosely together, in handfuls.

The hens roosting near this place would naturally get the worst of it through the night, so pour kerosene or distillate plentifully in every suspected nook or use some of the advertised lice killers freely. Had you dissected them, perhaps you might have found some cause like enlarged or congested liver, or intestinal irritation which would have helped the diagnosis, but the fact of their dying so suddenly is proof that some atcive agent was at work.—Mrs. F. M.

[Our subscribers must realize how impossible it is to give definite information without more definite information at the start. A hen that is well one day and sick or dead the next is a poor diagnosis on which to base a treatment. If the poultryman will always be observing it is possible he may see symptoms much earlier than is often done. That is, one may feel that his flock is perfectly well, while a careful examination might show dumpy hens. If this close observation is not made when the hen dies it seems sudden. But in any case an examination after death would probably give the owner some definite information. Close observation of your own stock will teach far more than all that Mrs. Metcalf can write. The Cultivator does not wish to discourage writing for information. This department is one of the most helpful. But give all the facts possible so that we may give intelligent answers.—Ed.]

Incubator Chicks.

I have been reading your articles on Poultry during the past year and have found much good from them. Many things have been a great help to me. I have a Petaluma Incubator, 324 egg size, have had two hatches. Each time out of 250 good eggs I got 128 chicks; a number would get part way out and die. I took the shells off of a few of them but they were not any good. I would like to know the cause. The incubator is in a house that is used for a brooder house. The temperature is very changeable and the heat is changeable in the incubator. I cooled the eggs five minutes twice a day after the first week, increasing the time each day until the last, when I cooled them about twenty minutes twice a day. The first week I cooled them just while I was turning them. I put moisture in the fourteenth day. I have no trouble in raising them. I lost five out of the first hatch and they were no good in the beginning, so I have not lost a good chick that was lively from the start. Should duck eggs be handled the same as hen eggs in the incubator; I mean the same temperature, cooling, moisture, etc.?—F. E. D., San Fernando.

I am inclined to believe you did not put in moisture soon enough. Those who have used the new Hygrometer claim that they get at least 25 per cent better hatches, and if so, one hatch will pay for it in the number of chicks, and more, too. Next time fill the moisture pans at the start and see if you do not succeed better.

For duck eggs, keep the temperature as even as possible in the machine; cool and air more than for hen eggs, and instead of putting moisture in the machine, sprinkle the eggs thoroughly every other day; this is a good plan also with hen eggs, as it makes the shells more brittle. When I used a hot air incubator, I sprinkled once a day the first week, twice a day the second, and three times a day the third week up to the 18th day, when I filled the pans in the machine. —Mrs. F. M.

THE APPLE.

In the last few years there has been in progress a great campaign of education among the apple growers of the United States, and one of the results of this movement was the exposition which was recently held at Spokane, Washington; a show which consisted wholly of apples and in which premiums representing thirty-five thousand dollars were awarded to the growers of the best commercial apples. The primary purpose of this exposition was to demonstrate the value of the apple as a wholesome food and to show its manifold uses and the uses of its by-products. The industry is a substantial one; few enterprises offer surer or more attractive profits. There will never be an over-production of first-class stock of either apples, cider, cider jelly or cider vinegar.

With the improvements in modern machinery, cider and cider vinegar costs less to produce than ever before, yet on account of the public demand for only first class apples, many hundreds of thousands bushels of apples are allowed to go to waste each year that might readily and easily be turned into cider for cider vinegar. The Hydraulic Press Mfg. Co. of Mount Gilead, Ohio, who are the pioneers in the manufacture of Hydraulic Cider Presses and cider and vinegar maker's supplies have kept in touch with all of the modern discoveries regarding the production of refined and clarified cider and they have recently issued the second edition of two fifty page bulletins treating of plans and processes for manufacturing cider vinegar, cider jelly, etc. This company has recently established an analytical laboratory at the home office in charge of an experienced chemist and horticulturist, for the purpose of analyzing ciders and vinegars and to advise their patrons how to produce high grade apple products and how to plant, cultivate, prune and spray, apple and peach orchards.

Coulson's
POULTRY FOODS

Special Dry Chick Food

Makes Them Grow

Throw it out in the Litter and Make them Work

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequaled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the present high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed, to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE-SAVER. Write us for free samples and prices.

HOW TO CAPONIZE.

It is strange to see how few farmers and poultry keepers know how to caponize, although I believe caponizing has been known for more than 2000 years, and yet one meets so many who seem to have little or no knowledge of this simple operation. Anyone who has traveled in France will no doubt be familiar with the popularity of the capon. The flesh and flavor of this delicate dish is indeed hard to beat.

In spite of this, however, many farmers and poultry keepers will say they cannot take the trouble or spare the time, forgetting, no doubt, the old proverb, "He that looketh for profit may not fly from labor." The operation is very simple, and can be performed by most people in a very few minutes. You will find that the loss by the operation will be very small, and those who will make caponizing a practice will be well repaid for their little extra trouble. The few who have already gone in for this particular branch of the table poultry will, I am sure, agree with me that it is well worth every poultry keeper's serious consideration.

The best birds to operate upon are chickens which have never yet crowed, and when about three or four months old is the right age. They must be starved for 36 hours or more before being operated upon. The operator should choose a place where a good light can be on the bird (sunshine if possible). The bird should be placed where the light is thrown on the side of the bird which is to be operated upon. Having secured your bird by means of two pieces of string three feet long, one end of which is fastened to the wings by fastening two half bricks (one on each string), the bird is placed on the operating table, and is now held quite firm. The small feathers from the hip bone to ribs, over the last rib, must now be fully plucked off, and the ribs and feathers should be wetted with cold water by means of a sponge (the water should be quite cold). The feathers will by this damping be kept out of the operator's way, and at the same time numb the sensations of the bird. The operator's knife should be stuck down between the first and second ribs from the hip bone, and out downwards and forwards to the end of the ribs, then turn the knife and cut nearly up to the backbone. The spreader should now be used which will open the ribs after which cut the striffin that covers the bowels. The operator will now be able to see the testicle, which should be grasped by the grippers and given one entire turn over, so as to separate the testicle from its attachment, except the spermatic cord, and pull the testicle out; and in the same way treat the other testicle. The chief danger in caponizing is in tearing the veins near the testicles, which results in the bird bleeding to death. This seldom happens, except through want of care or inexperience. Thus the importance of having a good light, in order to prevent this as far as possible.

Thus a little knowledge of anatomy in this way is very useful. One stick in the center of the incision will be quite sufficient. For all operations firmness and confidence are necessary. After the birds have been caponized, they should be kept separately for a few hours, and fed sparingly with soft food. After they have been marked in some way they may be let out; and, if well fed and are birds of the larger breeds, they will attain great weight and the meat will be found to be most delicate and delicious.—Poultry World, London.

DON'T FEED YOUR CHICKS TOO EARLY.

A reader in great distress about her chicks, writes as follows:

"My young chickens have some terrible disease. Eggs hatch well, but after the chicks are ten days or two weeks old they commence dying—get light in their heads, and are so weak they can hardly go without staggering as if drunk, though they eat hearty. Thought at first it was head lice, and applied vaseline with no apparent effect. Would you advise me to do away with the chicks, stop hatching a few months, and then try again?"

I don't think there is anything seriously wrong with the chicks, that is, no contagious disease. The whole fault, in my opinion, was in feeding too soon after hatching. This is one mistake that two-thirds of the poultry raisers make, and while earlier in the season the results are not so fatal, yet chicks at no season of the year should be fed until they are at least two whole days old. Where this rule is observed only about ten per cent of the hatches die from other causes than white diarrhoea. Nature provides for the chick's sustenance for at least three days after hatching, and feed given before that time is injurious. Think you can continue to hatch with safety if you will observe the caution about feeding too early.—Uncle Joe, in Progressive Farmer.

SOFT-SHELLED EGGS.

The production of soft-shelled eggs causes much annoyance and loss in many poultry yards. Such eggs are valueless for any purpose save home use, as they cannot produce chickens and they cannot be sent to market. There are three causes of soft-shelled eggs, the most common of which is an insufficient supply of shell-forming material. Laying hens require a generous proportion of lime in their food, as in 100 ordinary sized eggs there are more than twenty ounces of pure lime. Finely broken oyster shell is an excellent and a cheap form in which to supply the necessary lime. Fright sometimes causes a hen to lay an egg without a shell, but this is not so serious a matter, and is only temporary. The third cause is due to derangement of the egg organs, and, if the abundant supply of lime has not the desired effect, more drastic measures are needed. All food of a stimulating nature should be stopped at once, and an aperient given, consisting of one grain of calomel and one-twelfth grain of tartar emetic. A little iron should be added to the drinking water as a tonic, and the food should mainly consist of boiled rice.—Exchange.

Wire fence built in cold weather should be stretched tighter than when built in hot weather. "Cold contracts and heat expands metals," hence fence wire that is ringing tight on a cold day will be limp and loose on hot days. Some wire fencing is provided with crimps or springs, making it adjustable to the changes of temperature.

Sickly hens produce sickly chicks. It is well to take care of their health.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Lameness.

I have a very fine thoroughbred registered Holstein bull four years old. My soil is adobe. During the muddy times he apparently became very tenderfooted and traveled around but little. I tied him up until he got better, then turned him out again. He got tender again and walked very slow and lame and crippled in his hind feet. When he walked I could hear something pop every time he took a step. While on his feet he kept his hind feet constantly moving.—O. P. O., Porterville.

I am afraid I am like the Veterinarian, not able to tell you what is the matter with this animal. The popping sound I have never heard except in animals that had Black leg. This animal has evidently not that trouble. You do not mention any soreness or discharging places on his heels and legs so it cannot be grease heels. I should give him plenty of green feed and if he does not eat it readily and seems weak, try giving a quart a day of a mixture made of two parts rolled barley, two parts bran and one part oil cake. Begin with a handful and keep on until he gets a quart a day. The mixture referred to for adding to the drinking water is used in cases of rheumatism and is iodide of potasium; one teaspoonful in a gallon of drinking water or it can be added to the grain food. Give this for one week, stop at anytime he drools at the mouth, or his eyes look sore. A teaspoonful once a day is enough for one week. Then after three days repeat the medicine for a week. If the trouble is not better I would not dope him any longer. The summer-time change alone may cure him of this trouble, as it must be caused by colds and chills of sleeping on the ground.

Corn for Silage.

Can you suggest the best variety of corn to grow for silage and tell me where the seed can be obtained. The soil is a sandy loam similar to much of the University Farm, but has no irrigation. Also is sorghum for fodder best drilled or broadcasted and what is the right amount of seed per acre?—G. K. S., Davis .

We grow any of the white dent varieties. I secure my seed from the San Francisco Seed house usually, I should try Morse first of all. We drill sorghum about twelve pounds to the acre if we want it to grow heavy; up to twenty if we want it for hay. By drilling it the cultivators can run and keep the weeds down, that alone is considerable, as the weeds absorb moisture and also often spoil the taste of the feed.—M. E. S.

Silos.

I own forty acres of land three and one-half miles northwest of the state farm at Davis. I have ten head of dairy cows and want to increase to twenty head. Would it pay me to put up a silo and get a feed cutter? Does cane (sugar cane) pay in this country. Does it make good silage for a silo? I have ten acres in alfalfa and I expect to put in ten more this year if possible. Can one really keep more cows per acre with a silo than without In growing corn and cane for silage, do you think it pays to irrigate it?—W. H. B., Davis.

I hardly think with ten cows, the expense of building a silo and buying a cutter would be justified. I should begin rather and be sure my cows were all paying their way before I build one. The small Babcock test machine cost but a trifle and with one you can determine that the cows are all doing their part. Forty acres of alfalfa should more than keep twenty cows. We count a cow to the acre and usually throw in half a dozen colts. The alfalfa must be fenced to do this successfully and the stock changed every two weeks to fresh pasture. This will leave one of the fields each time for hay making if the forty is divided into four fields. The lines of division can be made profitable if the large black willow is used for posts, they grow readily and furnish shade for the stock and firewood for the family. Putting the cows out five hours in the morning and then again at bedtime for the night-feeding, will save the alfalfa greatly, as the cows will not trample it out.

If by sugar cane, the regular cane is meant. I never knew but one man to grow it in this neighborhood, and he did it more as a fancy and did not find it enough more profitable than the common sorghum and ordinary corn. Corn and sorghum are both greatly increased if irrigated before each cultivation. Water and sun heat make a team that pulls the corn skyward rapidly. I have grown six-foot oats and fifteen-foot corn on the same land in one season by their aid.—M. E. S.

Cottony Cushion Scale.

Kindly tell us what has been found as the most effective exterminator of the white or cottony cushion scale and at what season of the year may the best results be secured.—T. J. F., Los Angeles.

The best remedy against the white or cottony cushion scale, or to be scientific, the Icerya purchasi is to write to the State Horticultural Commission, Sacramento, and ask for a colony of Vedalia cardinalis. This little insect will subjugate the worst attack of the white scale. As to time of year, it is immaterial, though if the scale is a pest, we would get busy at once. However that scale is easily controlled by use of the whale oil soap.

Needs a Mother.

We are subscribers to the Cultivator and have read Mrs. Sherman's department for several years, deriving many benefits from it, but have never read anything that just fits this case. Our driving mare foaled the 24th of this month a well-formed colt, but she has very little milk and will not own her colt. Has to have a foot tied up before she will allow it to come near her. We have let it nurse five or six times a day and are feeding it cream, sugar and water from bottle. Can you tell me if this is all right and how long before she should come to her milk, if she ever does. She is fed on good alfalfa pasture and hay with barley and raisins. —Mrs. B., Dinuba.

This mare may do better with her next colt. Some of my best bred mares do not have enough milk for the first colt or two they have. We feed these little chaps on cow's milk at first, adding a third water, as cow's milk is richer than mare's milk. Feed them a quart at first twice a day and increasing it up to half a gallon as the colt needs it and at the same time feed it warm. The water is gradually decreased until the colt receives pure milk, say by the time it is six weeks old. The best way to feed is in a shallow pan until they learn to drink without choking. Then they can be fed from an ordinary pail. Let the colt take whatever milk the mare can furnish him. If he grows constipated a little bran porridge made by boiling a handful of bran until it is tender and adding a teacop of this bran to the milk at feed. This milk should be as thick as cake batter that can be dropped from a spoon. I do not see any reason why this should not be as good a colt as though it had received natural sustenance from its mother. We nearly always have a colt raised in this way each year. They soon learn to watch for the milk truck and come running to the milk room door to be fed. The milkman pours their milk into the pan and they drink it without any trouble to anyone. When they are five or six months old they become full of pranks as a school boy, stealing the men's hats and carrying away halters and straps and have to be chased away.—Mrs. M. E . S.

World's Record.

Will you please tell me, to settle a dispute, which breed of dairy cows has made the biggest record. That is, made the most butter last year. If you can give the name of the cows and amount please do so.—R. O., Gilroy.

The world's record at present is held by a Holstein cow. Colantha Fourth Johanna, record for one year: Milk 27,432.5 pounds; average test, 3.64 per cent; fat, 998.26 pounds. The next in record is the champion of the Guernsey breed. Record for one year: Milk, 14,920.8 pounds; average test, 5.74 per cent; fat 857.15 pounds.

Cultivator Publishing Co., 115 1-2 North Broadway, Los Angeles

AERMOTOR PUMPING DEVICES

Are known and used the world over. Hundreds of thousands of AERMOTORS in use. Thousands of GASOLINE PUMPS in use.

NOTE THE ROOM IN THE BASE OF THIS TOWER FOR PUMP, TANK OR STOCK.

$25 Buys an 8-ft. Aermotor. This is the galvanized-after-completion steel Aermotor which revolutionized the windmill business. It contains every improvement which wide experience has shown to be desirable.

The Aermotor Gasoline Pump is easily attached to "any old pump" in 30 minutes. The engine and pumping gears are assembled in one simple, compact and durable machine which is complete in every detail and ready to set up and go to work. It will pump as much water as an 8-ft. windmill and will run as many hours a day as you desire.

We make so many of these engines that we have put in the facilities for building them perfectly.

We are almost ashamed of so low a price on an engine so well designed and so well built, but we are proud of the engine.

No other pumping device ever gained such great popularity or reached such great sales in so short a time

PRICE **$37 1/2** For engine complete with walking-beam and supporting frame.

$27 Buys a 30-ft. Trussed Tripod Tower with unobstructed base.

This does not appear again. Write now for circulars and testimonials.

You can afford to have one of these on every well.

It occupies very little room, requires little attention, and gives a large amount of service. The supporting frame is clamped to the pump standard, making a very solid and compact arrangement.

These attachments have been devised to provide the easiest, quickest and most substantial way for connecting to any style of pump which is already in the well. Everything is supplied for setting up complete as shown, except the stakes.

AERMOTOR CO., Campbell Avenue and 12th Street, CHICAGO

Next in order is champion of the Jersey breed. Milk, 14,254 pounds; average test, 5.6 per cent; fat, 798.48 pounds. Next comes the champion of the Ayrshire breed. Milk, 15,072 pounds; average test, 4.26 per cent; fat, 643.2 pounds.—M. E. S.

Mangel Wurzels for Hogs.

I wish information in regard to the growing and feeding to hogs of mangel wurzel, if it pays to grow for that purpose. If so, how should they be fed to the hogs. I have some very rich bottom land and would like to know the best hog food that I can raise there beside corn.—J. J. M., Modesto.

In the past six years we have given over growing mangel wurzels, as the expense on rich soil of keeping them free from weeds proved very great. We have substituted the crooked neck squash or pumpkin and think it pays us rather better. We grow a winter grain crop on the land and make it into hay, then irrigate and plow and plant the pumpkins. This does away largely with the weeds, as the pumpkins go into the ground after the rains have ceased. Beets are best cut up before feeding; we ran ours through an old chopping mill after they had been cut into halves. They grow very large and make good feed, rather more, I think, to the acre, than the pumpkins, barring the one objection of having to weed them. Have you ever grown common peas in the winter for pigs, and in the summer beans, horse, brown-eyed, flat or broad beans? We like them and get large tonnage of good feed from them. The beans are cut, vines and all and fed to the hogs, or they can be turned in to gather them as soon as the pods form—M. E. S.

Poisoning Squirrels.

Please give me information as to how to destroy ground squirrels which are proving a great pest.—S., Los Angeles.

The most economical, and usually the most satisfactory way of disposing of squirrels is by poisoning. However the smoker and the bi-sulphide have been used very satisfactorily. Taken when the ground is wet the poisonous gases liberated in the hole and the hole immediately stopped will destroy great numbers.

Poisoned wheats are sold in the market or prepared according to a formula given in the Cultivator recently are effective. The succulent fruits or vegetables, especially the rind of watermelon, is excellent for poisoning them. If in the dry grain field where little of such food is handy to the squirrels they will take to it and great numbers will be poisoned by the use of such food. Strychnine is probably the best using it in small quantities and as little on the outside as possible. Where a smoker is used stop all the holes excepting the one in which the smoke is being forced, then pump full and close quickly. If bi-sulphide of carbon is used it may be poured into the hole, or better poured on a piece of cotton which is forced into the hole as far as possible and the hole immediately closed. Use care in handling this material so that it does not explode or set on fire as it is extremely combustible. If young orchard is near the pests and the trees are being injured, a newspaper wrapped around the trunk will keep them from doing any damage. The best method is for the entire neighborhood to join. Where the pests are really bad one neighbor's work is of little avail as the pests from other sections will repopulate the holes again.

Fertilizer for Garlic.

Which is the best fertilizer for garlic? I planted one acre and a half in garlic last December. The garlic is not making the bulbs as it should do. Is there any way of forcing to make better bulbs?

About one month from now, I intend to plant sweet potatoes between, and I have to put some fertilizer on, as the ground is not rich enough to raise two crops at once.—J. H. S.

In this case I know of nothing better than Nitrate of Soda. Use at the rate of 200 pounds per acre and make two applications about two weeks apart. If your correspondent has never used it he will find it resembles coarse salt. Before using, I break it up with the back of the shovel and pass it through a screen so as to have it fine as possible. It should be sown broad cast over the crop, and so light an application will not injure the garlic tops. Apply it when the tops are dry. It will soon dissolve and disappear—especially if the nights are cool and damp. Continue the cultivation of the crop just as usual. Because nitrate of soda is so soluble it is better to make two applications at intervals than to apply the entire quantity at once. The crop is then able to appropriate all of it.—Q. A. L.

Scab.

"In treating potatoes with the formalin solution for scab; does it make any difference whether the treatment is applied before or after cutting for planting?—J. A. N., Hemet.

Yes. They must be treated before cutting. Two years ago one of my neighbors treated after cutting and ruined the entire lot. After taking them out of the solution, be sure that they are reasonably well dried off before cutting.—Q. A. L.

Fungous Troubles.

I am forwarding to you under seperate cover sprig from peach tree. What is the matter with it, and what is the remedy? Also sprig from almond tree. A number of trees through the orchard (2 years old) have failed to make any growth to speak of and the leaves curl up and die. Last year, about August, a number of the trees began to turn a yellowish white and, though continuing to put out new growth, the old leaves, as described above, could be pulverized in the hand. And third a cork like growth taken from roots of one year old almond trees. Is this Crown Gall—and can anything be done for the trouble?—W., Sanger.

Answer by Prof. Ralph E. Smith of the Southern California Pathological Laboratory. Sample No. 1 is affected with the peach curly leaf. This disease is readily prevented by spraying the trees thoroughly with Bordeaux mixture just before the buds open in the spring or at the time they begin to swell. The disease is very readily controlled by such treatment, but at this season it is impossible to do anything for it. Sample No. 2 has failed to reach me. No. 3 is the crown gall, a very common trouble on the roots of many kinds of fruit trees. If this is abundant on the roots of young trees there is not much to be done in the way of treatment. One should be very careful not to sell or plant such trees.

Whitewash for Borers.

A short time ago I wrote asking for information regarding the quantity of crude carbolic acid per gallon of

Classified Liner Columns

Rates 1½ cents per word per issue. No ad. accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad. for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

SWEET ORANGE SEED

FOR SALE
A. Tuffill Association
854 W. Adams Street, Los Angeles, Cal.

whitewash to prevent attacks of peach borers.

Since then, directions for making such a wash has been given me by a fruit grower friend of many year's successful experience and who tells me it is the best and surest thing he has ever found. I am using it this season and it may help some one else.

Fresh lime 1 peck.
Crude carbolic acid ½ gallon.
Soft soap 1 gallon.
Sulphur 4 pounds.
Salt as in ordinary whitewash.

Slake the lime (with old soapsuds if possible) and add the acid while hot.

Also 1 pint carbolic to 15 gallons old soapsuds used as spray or wash will keep all insects off for months.—P. N. Warner, Sanger.

Palo Verde.

What kind of soil has government land in the Palo Verde Valley? Is there water for irrigation, on what terms may it be had? What is the temperature of the valley? Is there a good demand for products? Is the country rolling or level?—H. H. F., Auburn.

The character of the soil in the Palo Verde Valley is similar to that of the Imperial, namely a fine silt or loam and is said to be very rich. Government claims, however, are largely taken up and there is but little opportunity of securing desirable ones except to go back some distance from the center and from the river. Some desert claims have been taken which those now holding are unable to keep because of lack of means to get the water on the land. These, we understand, are to be had reasonable. The temperature depends upon the location. It sometimes becomes rather cold and ice as thick as window glass was formed during the past winter. The temperature on mesas back from the river is said to be frostless. Of course, summer temperature ranges very high. There is no weather station located in the valley so definite figures cannot be given. At Yuma, which is probably similar, the temperature ranges from 22 to 118 degrees. As to the demand for products, the section is so new that there has been nothing produced more than is consumed in the valley. Until the railway goes into the valley the shipping facilities will not warrant a large output. The country is largely level. The altitude is less than 200 feet.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Lameness.

I have a middle-aged mare that is lame in her hind foot. The frog has cracked up and about three-fourths dropped off, and the bottom of her foot around the frog is dry and somewhat mealy; can be easily scraped off with a knife. There is no discharge and I can not detect any unnatural odor from it. When standing, part of the time she holds her foot up. After she lies down and gets up she is quite lame for a few minutes, or when left standing, but when kept moving she does not limp.

I do not know of any injury that she may have had; I have owned her about one year.—Subscriber, Riverdale.

I think you have overlooked something in your horse's leg. The symptoms do not fit with foot lameness and that dry, mealy condition often exists with no lameness. The symptoms as described fit exactly spavin lameness. Examine the other foot and see if a similar condition is not present. Examine both hocks carefully for any enlargements, also the ankle joints for slight bony growths; there is possibility of ring bone.

There is no chance for treatment until the lameness is located and that is not always easy when the horse is where it can receive a careful examination let alone the meager and often misleading report contained in a letter.—R. T. W.

Heaves.

We have a fine mare who undoubtedly has the heaves. She has coughing spells and breathes heavy sometimes accompanied by a wheezing sound. During the rainy season she stood in barn and got all the good alfalfa hay she wanted. Being with foal at that time perhaps she ate more than was good for her. Would like to know whether there is any remedy for it. Would complete rest in pasture do any good?—J., Biggs.

There is no specific cure for heaves. The distressing symptoms can usually be relieved by feeding a concentrated diet of grain and hay. Hay must be free of dust or smut. A small quantity of lime dissolved in the drinking water is beneficial. If turned on to dry pasture they generally improve.—R. T. W.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.
DR. R. T. WHITTLESEY.

THE HICKORY LOG.

Oh, helpless body of hickory tree,
What do I burn in burning thee?
Summers of sun, winters of snow,
Springs full of sap's resistless flow;
All past years' joys of garnered fruits;
All this year's purposed buds and shoots;
Secrets of fields of upper air,
Secrets which stars and planets share;
Light of such smiles as broad skies fling;
Sound of such tunes as wild birds sing;
Voices which told where gay birds dwelt;
Voices which told where lovers knelt,
Oh, strong, white body of hickory tree,
How dare I burn all these in thee?
—Helen Hunt Jackson.

NANNETTE'S WOE.

"AUNT NANCY'S come," Nannette announced to her bosom friend in a choked voice, "and of all the frights!"

"What do you mean?" asked her bosom friend.

"Well," hesitated Nannette, "of course she's as neat as can be, but her clothes look as if they were made for Mrs. Methuselah."

"If it's only her clothes, you needn't worry," remarked the bosom friend. "You don't have to wear 'em."

"It's not only her clothes!" shrieked Nannette. "It's her notions! They are simply appalling."

"For instance?" suggested the bosom friend, taking a look at her back hair in the mirror with the help of a hand glass.

"For one thing, she objects to my name," explained Nannette, indignantly. "The very first thing she did—did—after taking a comprehensive view of the family—was to stare at me through her spectacles—steel-rimmed ones, at that—and ask: 'Is this one Nancy, my godchild?'

"Dad, who is as proud as can be of his enormous family, looked a little sheepish at that.

"'Y-y-yes,' he stuttered. 'We had her christened Nancy, of course, but she has taken a fancy to be called—er—Nannette.'

"'Humph!'" said Aunt Nancy."

"Haven't I always heard you speak of your Aunt Nancy as a paragon?" demanded the bosom friend. "Haven't you told me time and time again that your father looks upon her as the salt of the earth?"

"He does," acknowledged Nannette. "And so do I at a distance. But because she is dad's favorite sister why must I follow her old fogy notions?

"Why she was perfectly scandalized at the idea of my entertaining Charles all the evening without the assistance of the other members of the family! The idea!

"Of course when the bell rang at the accustomed hour, that horrid Tom had to bellow out, 'It's Nan's Tuesday night beau, Aunt Nancy. Parlor's pre-empted for the evening.'

"You should have seen her stare.

"'Am I to understand, Maria,' she asked, fixing poor mother with her eye, 'that this child has visitors from whose company her parents and her brothers and sisters are bared?'

"'Times have changed, Nancy,' said dad, looking silly."

"And Aunt Nancy?" prompted the bosom friend.

"'In my time,' said Aunt Nancy, 'it was our greatest pleasure to have our parents and all the family enter into our enjoyments and help in the entertainment of our friends. Hospitality meant something then, and I believe our guests enjoyed themselves. It seems to me anything but dignified for parents to be excluded, or for any room in their house to be shut away from them.'"

"Well, I declare!" said the bosom friend.

"Now, do you wonder that I was frightened at the idea of Charles meeting her?" asked Nannette. "But I haven't told you the worst," with gloomy emphasis. "I slipped away while she was still holding forth, hoping that she would forget all about it. But I couldn't shake off my forebodings and the conversation flagged."

"Nothing unusual in that, is there?" wickedly interposed the bosom friend.

"Charles actually began to look bored," continued Nannette, "and then we both had such a shock! If you will believe me, who should come marching into the room but——"

"Aunt Nancy?" breathlessly interrupted the bosom friend.

"Aunt Nancy," repeated Nannette. "Wasn't it awful. I had been so afraid of something of the kind. She planted herself in the only straight-backed chair in the room and, sitting bolt upright, gave me my orders:

"'Now, Nancy, introduce to me your friend.'

"Charles had been lounging in his chair and I assure you, Isabel, that the way she looked him over through her spectacles made him straighten up in short order.

"I felt as if I should sink through the floor when she came in wearing her plain black dress and white collar and cuffs, her hair parted in the middle and plastered down on each side, looking the world as if it had been varnished, she had brushed it so smooth. You know how stylish and exclusive Charles' people are?

"Well, before I knew it, they were talking together in the most animated manner. I don't know when I have seen Charles so interested. It was strange talk to me, too, for, as dad says, I have neglected to cultivate my mind.

"They talked about literature, art, politics, and even science, and I had to sit there like a dummy and listen to them. Even while he was holding my hand to say good night he was looking at and talking to Aunt Nancy.

"Now what do you think of that?

"I think you're lucky that your Aunt Nancy is too old for Charles to marry," said the bosom friend.—Chicago Daily News.

About the House

SO many of us are doing our spring sewing now that I thought the following "hints" might prove useful.

Machine oil can be taken out of white goods if the stains are rubbed with lard, left for a few hours and then washed with soap and water.

It is not every one who knows that there is a simple and easy way of sewing lace to a plain edge when the lace has to be gathered. There is in almost every lace stout thread on the plain edge of the lace, and this thread is for the purpose of gathering lace. Simply pull the thread until the lace has been gathered sufficiently, and then stroke it to get the gathers even. The lace is then ready to be

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT,** soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

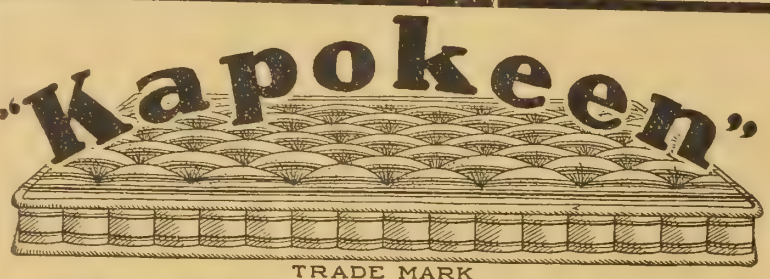
"Kapokeen"



TRADE MARK

The Mattress of Quality

In introducing our Kapokeen Mattress to the readers of The Cultivator, we are taking the first steps toward establishing a National reputation and market for an article, which, on account of its many advantages, has gained a pre-eminent position in its own vicinity.

"Kapokeen" is made from the Kapok or silk floss obtained from the bean of the Eriodendren tree, grown on the island of Java. It is prepared by our own patented process, which removes every particle of seed and preserves in full the resiliency of the natural fibre.

The mattress is made in our own factory where every precaution has been taken to insure absolutely hygienic conditions, by skilled workmen using only the best quality of materials throughout.

NOTE THESE POINTS.

Kapokeen can be "made over" in exactly the same manner as hair.

Kapokeen is sun dried, sun cured, and free from chemicals or other foreign substances.

Kapokeen, no matter how long it has been in use, by being placed for two hours in the sun, will expand and become as resilient as a new mattress.

Price No. 1 Kapokeen Mattress, 4-4 size, 5 1-2 inch box, Imperial edge satin ticking **$15.00**

Three-Quarter Size, $12.50 Single, $10.50

Kapokeen Mattreses are made only by

sewed to the edge. There are a number of people who gather the lace by hand because they do not know of the thread, which gathers it more evenly than it can be done by hand.

If a buttonhole tears out lay a piece of closely woven tape back of it, stitch firmly in place, hem the old buttonhole to it neatly and then cut and work in the tape a new buttonhole of the proper size. An extra fine way is to rip the band apart and take out the threads of the old buttonhole, stitch the tape on the inside of the back fold of the band, stitch up the latter in its original shape and proceed as before. When buttons have torn out it is comparatively easy to squeeze a small square of good tape through the hole, lay it flat in the proper position between the two folds of the band and stitch it in place. Hem down the ragged edges on both sides and sew the buttons to the tape. Any button or buttonhole that is to bear strain should be stayed with tape when the garment is being made, the stay tapes for both buttons and buttonholes being placed in the band before it is stitched.

Rhubarb is plentiful now and a rhubarb pie that is said to be extra good is made by stewing the rhubarb, sweetening it and then stirring in a well beaten egg just before putting it in the oven. Do not have an upper crust, but have a frosting like a lemon pie.

A good luncheon or supper dish can be made from a can of salmon and is called "salmon pudding." Drain the liquor from a can of salmon and save it for the sauce. Pick up the meat and rub into it a tablespoon of butter (melted), two eggs and a cup of bread crumbs; season. Put the mixture in a buttered mould and steam for two hours. Set in cold water to loosen the pudding and turn out on a hot plate. For the sauce: Add to the liquor a teacup of drawn butter, a well beaten egg, a dash of mustard, salt and pepper. Boil until creamy thick and pour over the hot pudding.

Potato salad is always with us and one of many ways to make it is given this week: Six boiled potatoes, two small onions, two hard-boiled eggs, pinch of salt. Chop onions first very fine, then chop the potatoes and eggs, but not so fine.—Elbepe.

RAISIN RECEIPES.

Raisin Rolls.

Sift together 1 quart flour, 1 teaspoon salt, 2 tablespoons sugar, 2 teaspoons baking powder; rub in 2 tablespoons butter, add ½ pound seeded raisins. Mix with enough milk to make a firm dough. Knead for a few minutes then divide the dough into pieces the size of an egg, form into long rolls, lay one inch apart on buttered pans, brush with milk and bake in a hot oven.

Raisin Muffins.

One pint flour, ¼ teaspoon salt, 2 tablespoons melted butter, ¼ cup sugar, 2 teaspoons baking powder, 1 cup milk, 1 cup seeded raisins. Mix as for plain muffins, adding the raisins last and dusting them with a little flour. Bake in muffin rings in a hot oven.

Raisin Pudding.

One cup finely chopped suet, ½ cup sugar, 2 eggs, ½ cup milk, 1 cup whole wheat flour, 1 teaspoon baking powder and 1 cup seeded raisins. Steam for three hours and serve with any good pudding sauce or cream and sugar.

Raisin Pie.

One cup seeded raisins, a little salt, 1 tablespoon corn starch, 2 eggs, 1 scant cup of sugar, a piece of butter the size of an egg. Stew the raisins in enough water so that when the raisins are done there will be a pint of juice, Thicken this with the corn starch, dissolved in a little cold water. Then add the salt, sugar, butter and the yolks of the eggs, well beaten. Bake without an upper crust. Beat the whites of the eggs until stiff, sweeten a little and when the pie is done spread over the top and place in the oven for a minute to brown.

If you prefer a pie with two crusts use this same recipe and you will find it very good if you omit the eggs.

California Raisin Bread.

One pint water, 1 pint sweet milk, 2 ounces sugar, 1 ounce salt, 2 ounces lard, 1½ ounces compressed yeast, 2 pounds seeded raisins, 4 pounds flour. Have milk and water warm. Dissolve yeast is water. Mix dough thoroughly. Let dough raise well, then punch down and let raise again. Mould in round loaves and when raised bake in hot oven of about 450 degrees. When potato yeast is used, use one pint yeast and one pint milk or water.

Graham Raisin Bread.

One quart water, 2 ounces lard, 2 ounces sugar, 2 ounces molasses, 1½ ounces salt, 2½ ounces compressed yeast, 2 pounds raisins, ½ pound chopped nuts, 2 pounds white patent flour, 2 pounds graham flour. Let dough raise twice and when raised again bake in medium hot oven.

Raisin Brown Bread.

Three cups yellow corn meal, 1½ cups graham flour, 1½ cups white flour, 1 cup N. O. molasses, 1 teaspoon soda dissolved in ½ cup hot water, 1 teaspoon salt, enough sour milk to make soft batter. Mix flour and salt then molasses with soda, stir until foamy, then add milk and 1½ cups Sultana raisins. Fill mould half full and steam three hours.

Raisin Fudge.

Two cups sugar, 1 cup milk, butter size of an egg, ½ cup chocolate. Cook, stirring continually until bubbles break slowly. Have ready ½ pound walnuts chopped fine and 1 pound chopped seeded raisins. Add these and stir until stiff and pour into buttered pans; mark in squares when sufficiently cool.

Fruit Cheese.

One pound each of raisins, figs, dates, currants, blanched almonds, and 2 pounds of walnuts. Grind fine and mix well and compress tightly and let stand for two or three days, then cut into squares and roll in powdered sugar.

Raisin Chocolates.

Select smooth seeded raisins. Put ½ pound cake of vanilla sweet chocolate in a sauce pan over boiling water, and when melted add 2 level tablespoons butter and 2 of boiling water. Dip raisins and put on oiled paper.

Raisin Salad—Very Fine.

One cup celery cut in pieces, ½ cup of walnuts, cut in pieces, ½ cup chopped raisins. Combine and serve on lettuce leaves with Mayonnaise dressing or cream dressing.

Mock Mince Pie—Cheap but Good.

Two cups Sultana raisins (1 pound), ¼ cup vinegar (good), ¾ cup boiling

water, 1 cup sugar, ¼ teaspoon cloves, ½ teaspoon cinnamon, ¼ teaspoon allspice or nutmeg; little salt; chop or grind raisins, add ¾ cup boiling water and cook 10 minutes. Mix the vinegar, boiling water, sugar, salt, spices and boil until it becomes a syrup (8 or 10 min.) Combine the syrup and raisins and let cool slightly. Make a rich pie crust and if convenient add a few small dots of butter after putting in filling and sprinkle a little sugar on top. Cover and bake.

California Raisin Sandwich.

Delicious for afternoon teas, picnics, and children's lunches. Chop fine 1 cup of seeded raisins, together with 1 cup of nuts, preferably walnuts mix with whipped cream or the white of an egg beaten, season with salt. Spread between slices of bread cut very thin.

Raisin Ice Cream.

There is no finer fruit ice than finely chopped seeded raisins added to ice cream of any flavor.

ANSWERED THE REQUIREMENTS.

"I want to give her a useful present that costs enough to make it seem worth while," he said to the obliging salesman of the great department store.

"What do you say to a dozen strictly fresh eggs?" the salesman obligingly suggested.—Cleveland Leader.

LOVE'S PHILOSOPHY.

The fountains mingle with the river
And the rivers with the ocean;
The winds of heaven mix forever
With a sweet emotion.
Nothing in the world is single.
All things, by a law divine,
In one another's being mingle.
Why not I with thine?
—Shelley.

ENTITLED TO A SHOW.

Man wants but little here below,
And he gets a whole lot less,
In fact, if he but gets a show,
He has cause for thankfulness.
—Chicago News.

It is not luck, but labor, that makes men. Luck is ever waiting for something to turn up; labor, with keen eye and strong will, always turns up something. Luck lies abed and wishes the postman would bring him news of a legacy. Labor turns out at 6, and with busy pen or ringing hammer, lays the foundation of a competence. Luck whines. Labor whistles. Luck relies on chance; labor on character. Luck steps downward to self-indulgence; labor strides upward and aspires to independence.—Cobden.

A school teacher who was giving her little pupils instruction on the subject of idioms asked her class to give an example of "the bitter end."

Willie Jones said: "The Japanese chased the Russians to the bitter end."

"Very good," said the teacher. "Yes, Bobby Brown," you may speak."

Red with excitement, little Bobby spoke up: "Our dog chased our cat over the fence and bit 'er end."

Nobody knows of the holes to mend,
Nobody knows of the buttons lost;
Nobody knows of the babes to tend,
Nobody knows what the groceries cost;
Nobody knows of the socks to darn,
Nobody knows of the patching done;
Nobody knows—here we'll end this yarn—
Nobody knows but mother.
—Boston "Herald."

"Johnny, where have you been? Your hair is suspiciously wet. School was out two hours ago." "I fell in the creek." "But your clothes are not wet." "Well, you see, mamma, while I was standing on the bridge I thought maybe I'd fall in so I took off my clothes, an' I did."

"Dear," said the physician's wife, "when can you let me have $10?"

"Well," replied the medical man, 'I hope to cash a draft shortly, and then"—

"Cash a draft What draft?"

"The one I saw Mrs. Jenkins sitting in this morning."—Philadelphia Ledger.

"I'm told you play golf on the Sabbath," said the Rev. Goodman, sternly.

"Yes," replied Miss Kute, "but on that day I only use the sticks I won at our church fair."—Philadelphia Press.

Thin Boarder (delightedly)—The beef is very tender today.

Mrs. Slimdiet (wildly)—My goodness! That new girl must have gone to the wrong butcher.—New York Weekly.

If the skin is inclined to be scaly, do not steam the face nor use soap in washing.

LIME WATER FOR WORMS.

To rid the soil in your flower pots of worms, use limewater. To make limewater, put into 10 or 12 quarts of water 1½ or 2 pounds of fresh lump lime. Let it stand a couple of days or until the lime has slaked and settled, then pour off the clear water for use. Water the infected soil with this water two or three times at intervals of two or three days. It will drive the worms out.

Americans are beginning to learn that the adornment of the house and surrounding grounds is an important element in the education of children and does much to cultivate good morals and good manners.

Hay.

Somers & Co. say under date of April 16:—Receipts of hay during the past week have been very heavy, a total of 3950 tons arriving, which amount is more than we have received any one week in the last six months. A very large portion of these shipments has been inferior alfalfa and stock hay from the San Joaquin valley, which of course is becoming quite a drug on the market. The better grades of hay continue in excellent demand and although there is a trifle weaker tendency on account of so much hay arriving, yet we cannot quote materially lower prices on same. The fact that all this hay which is now arriving is being placed among consumers and not stored up here, give evidence that if we should experience a short period of light receipts, prices would certainly advance. There is no question but that there is bound to be some dropping off of receipts for figures show very clearly that there is not enough hay stored in country districts to supply this quantity to San Francisco until new hay is available. Present prices are as follows:

Choice wheat hay per ton	23.00@26.00
Good wheat hay per ton	21.00@23.00
No 1 wheat or wheat & oat	21.00@23.00
Choice tame oat	21.00@25.00

Citrus Market

LOS ANGELES, Cal., April 21, 1909.

Oranges have been going forward at an exceptionally heavy quantities, some days as high as 150 cars of oranges and 25 to 35 of lemons. Notwithstanding this great output the Eastern buyers have been fairly eager to pick them up and no heavy decline has been observed. In fact present quotations are fully up to those of last week. Even the auction market is looking good. It is hoped the prices which were received a few weeks ago may even yet be secured in the face of this output.

The large output of lemons has also been well received and commanding prices satisfactory to the shipper. These prices will, of course, improve as the season advances.

Shipments.

Total of shipments of oranges to date since Nov. 1, 16,745 of lemons, 2,422 or a total of citrus shipments 19,157, the same date last season oranges 16,057, lemons 2,037 or a total of 18,094.

NEW YORK, April 19.—Fifty-seven cars oranges and three cars lemons sold. Market slightly easier and lower, especially on large sizes. Weather clear and warm. Market firm on good stock lemons.

NITRATE OF SODA.

Nitrogen is the first plant food to become exhausted in the soil, hence it is most commonly the deficient one; and without sufficient nitrogen in the soil the plants are unable to appropriate more than a limited amount of the other plant nutrients. Thus is seen the double necessity of supplying Nitrate of Soda to the growing crops.

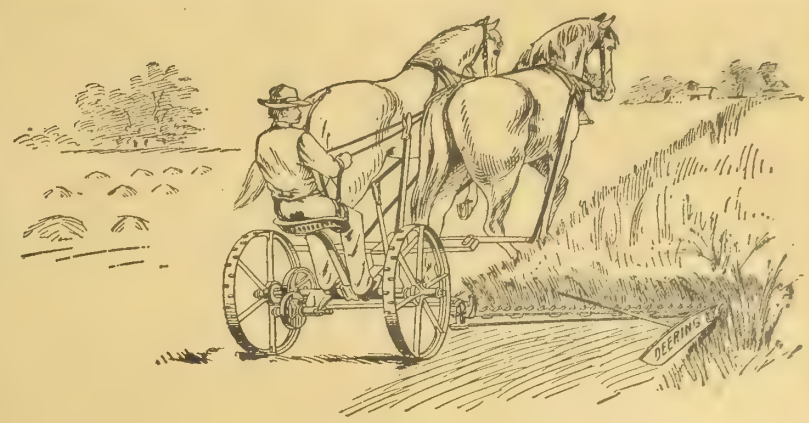
Nitrate of Soda is of special value in forcing rapid development and early maturity of most garden crops; but the best results are obtained from Nitrate when applied in the early stages of growth, as late applications may protract the growing period and delay maturity.

Even the legumes, although possessing the power to assimilate the atmospheric nitrogen, are benefitted in their early life by Nitrate of Soda.

The Nitrogen in green manure is not to be relied upon, since the presence of decaying vegetation favors the reduction of nitrates with loss of a large per cent of their nitrogen.

General directions for using Nitrate of Soda:—Apply by sprinkling a few inches from the roots when the plants are dry, avoiding direct contact with them; and it is recommended that each application be followed by cultivating so that the Nitrate can the more easily reach the feeding roots, particularly in localities where dry weather begins at an early date.

Deering Ideal Mower



When it comes to the test the Deering ball and roller bearing mower is ahead of them all—the lightest draft—simple—durable—with few parts to wear or get out of order. Cuts from the start in heaviest grass or grain—a pleasure to use and a satisfaction to own.

We sell highest grade harvesting machinery of all kinds, including the light-running, ball and roller bearing Deering Headers. Get your orders in now. Catalogues, description and testimonials on request.

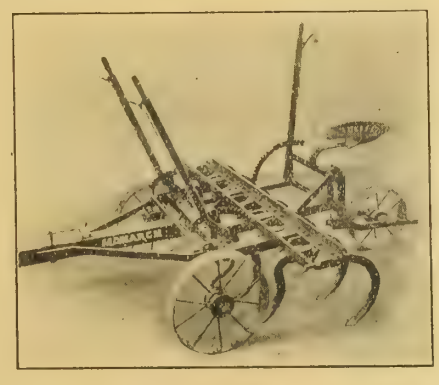
Wagons, Carriages, Harness, Farm Implements of all kinds.

OUR MONARCH CULTIVATOR



Is designed for heavy work. Has great clearance (17 in.) between front and rear standards, which permits the working of trashy or lumpy ground, and lightens draught. While designed more especially for field use, it is now becoming a favorite among orchardists where deep cultivation is desired. By the arrangement of levers it can be carried level or deeper on one side if desired. Write

THE
Latest Deep Well

Guaranteed to deliver from 100 gallons per minute upwards, depending on the diameter and capacity of well, from a depth of 50 to 300 feet below the surface. Can be either belt driven or direct connected to electric motor as occasion requires.

Write for Catalogue 46B.

Byron Jackson Iron Works

Turbine Pump

A deep well pump that has no valves or plungers to wear or get out of order, no gears, consequently no noise or breaking of teeth.

Compact, durable, always primed and ready to operate, constant flow, hence increased capacity of well.

This type of pump is fast taking the place of Vertical Steam. Deep well Plunger and Propeller Pumps.

Main Office and Works:
Carlton Station

TRADE Sharples MARK 29 Yrs

Did You Ever See the Like?

This picture shows just a small part of the **carloads** of common "bucket bowl" cream separators, of all kinds, we have recently received in exchange for Sharples Tubulars. The former owners thought they wanted "bucket bowl" machines. But they soon wished they had bought Sharples Tubulars instead.

This is just a hint to you from what others have learned by experience. Thought they would like common "bucket bowl" cream separators—the kind with bowls set open end up, fed through the top, and filled with contraptions. Tried them, were not satisfied, traded them to us, for a small part of their cost, in part payment for a Sharples Tubular. They made a mistake in buying "bucket bowl" machines, but were sensible enough to correct it.

Take the hint. Buy a Sharples Tubular in the first place.

Tubulars are made in the world's biggest separator factory. 1908 sales way ahead of 1907—out of sight of most, if not all, competitors combined. The fine features of our 1909 Tubular "A" are making 1909 still better. Catalog No. 260 tells all about them.

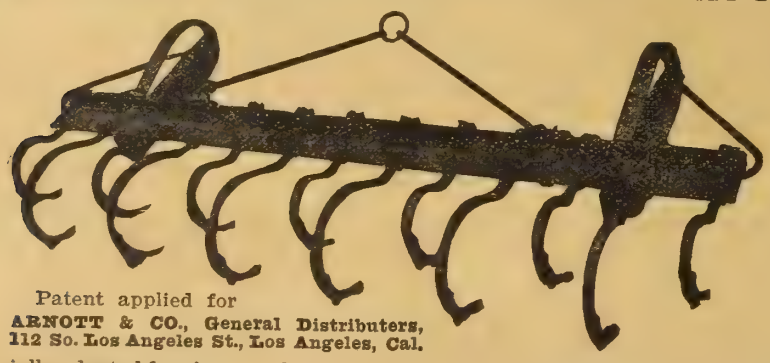
WILLIAMS' GOOSE-NECK CULTIVATOR



Patent applied for
ARNOTT & CO., General Distributers,
112 So. Los Angeles St., Los Angeles, Cal.

Especially adapted for citrus orchards. Sizes 7 to 14 ft. Lightest draft. Write today

The following is a sample of the unsolicited testimonials received regarding the Williams Goose-Neck Cultivator:

Merle, San Diego County, Cal., March 25, 1909.

Arnott & Company,
Los Angeles, California.

Dear Sirs:—You may recall that I recently purchased one of your Williams Goose-Neck Cultivators. I wish to say that I am exceedingly well pleased with it. In fact, as I told Mr. Jones, your representative in Oceanside, I would not take $500.00 for it if I could not get another. This is not an exaggerated statement, I mean it literally. In this section we do not have irrigation and everything depends on proper cultivation, so that good tools are very important. There are three points in which the Williams Goose-Neck Cultivator surpasses all other cultivators which I have seen, viz:

First. The draft is very light. My two horses weigh 900 lbs. each and they have no difficulty in drawing the 7 ft. cultivator.

Second. The Williams Goose-Neck Cultivator stirs the soil well without exposing the subsurface, thus preventing the escape of moisture.

Third. The cultivator being of low construction, one can cultivate under the trees as easily as harrow.

I was showing my cultivator to a neighbor the other day and had him take it home to try it. The use of it for half an hour so thoroughly convinced him of the merits of the tool that he has, through Mr. Jones of Oceanside, given you an order for one-half dozen cultivators.

Messrs. Williams & Son of Orange certainly deserve great credit for inventing the Goose-Neck Cultivator.

Sincerely yours

LOUIS C. LUHR.

Life History and Control of Red Scale

An Excellent Article by Prof. A. J. Cook of Pomona College

The activity of the Claremont-Pomological Club has been remarked in this paper. The work is enlarging and becoming more practical. The Pomona Journal of Entomology is the latest manifestation of the activities of that Club, though the Journal is really published under the patronage of the Ontario-Cucamonga Citrus Association and by the Department of Biology of Pomona College. It is most creditable to that institution and doubtless will be of practical value to orchardists. The following liberal quotations are from the pen of Prof. Cook and from the first number.

IF WE expect the water problem, and possibly that of fertilizers and cultivation, no question more concerns the growers of citrus fruits than that of scale insects. Success demands their control and that often involves great expense. At present, there are four or five of these insects that are seriously destructive in Southern California; the yellow scale, the black scale, the purple scale, the mealy bug and the red scale. So blighting is the work of these insects, and so difficult and expensive their control that it is exceedingly important to eradicate them, if possible, when localized, and to quarantine rigorously against them, when absent. All scale pests, when numerous, are very harmful to the plants on which they feed. The red scale is perhaps the most to be dreaded, as from the great variety of its food plants, it becomes very difficult and expensive to successfully fight it. Its enemies have not in the past been able to hold it in check, or prevent its spread. Right action in this matter means a tremendous saving to our citrus fruit growers.

Family of Scale Insects—Coccidae.

A word about this family of insects that includes the scale insects and the mealy bugs is desirable. The females are always wingless, though both sexes are scale-like in form at first, while the mature male is always possessed of two wings. Like the Aphids, or plant lice, and the Aleyrodids, or white flies, they belong to the Homopterous division of the true bugs or Hemiptera. In this sub-order the wings are much alike, and all are quite similar from end to end. All insects in this order are pre-eminent for their sucking habits. Their rostrum or beak is made up of needle-like mouth-parts and modified specially for piercing and sucking.

Sub-Families of Coccidae.

There are several sub-families of coccids, three of which greatly interest our orchardists. The females of actolypinae or mealy bugs preserve the form of the very young throughout life, and are always active. They secrete a waxy covering that serves to protect them, and often crawl into crevices and even into the earth and so are difficult to combat. Their habit of movement throughout life, makes their spread more easy and rapid. They are seriously destructive.

The second sub-family, Coccinae, are unarmored, and so when we touch the scale, we touch the insect. We are familiar with these in the black scale, the frosted scale and the soft brown scale. The absence of armor or a separate scale to shelter them makes their destruction more easy.

The third sub-family Diaspinae, has a separate scale which consists of a central projecting portion, made up of exuviae or cast skins of the young or laval insect, and a flatter border, a secretion, which is gray or brown. We are familiar with these in the red, yellow, purple, greedy and lemon-peel or ivy scale. This protection makes their destruction more difficult; hence the increased dosage for red and purple scale when we fumigate. In both these last two sub-families, the young insects soon become anchored, by their long beaks, and so move but little, though the Coccinae can, and upon occasion do so move till quite late in their development. With the first moult the Diaspinae lose their feet and antennae, and the motion that they seem to make must be largely through their rostrum or beak.

Reproduction of the Coccids.

Many scale insects, like the black and purple scale, are oviparous, that is they are egg-laying. These are likely to be more regular or periodic in their appearance, and so we may find most all eggs, or young, or mature, at one and the same time. This, of course, is favorable to their destruction, as we can plan to fight them, while they are all young and more easily killed. In our warm climate, this regularity is likely to dis-

Red Scale on Orange.

appear. Other scale insects, like the red, the yellow and the soft brown, are ovoviviparous, that is, no eggs are ever laid, but the insects are born alive, and are active at once. We are likely to find these in all stages of growth and development at any day or week of the year. Of course, this makes their destruction the more difficult.

Nativity of The Red Scale.

China has been claimed as the original habitat of the red scale. This may or may not be true. The fact, however, as we shall see, that it feeds on a great variety of food plants, has resulted in its being spread all over the earth, so that now it is found on all continents, in New Zealand, Hawaii, and many other islands. This fact is important, as it makes their introduction into new localities more easy and probable. We are not surprised then to learn that this pernicious scale is in every county of Southern California. Localities, like Claremont, that are free from its ravages, should spare no effort to keep it out; those not so fortunate, should, for self-interest and good of neighbors alike, be equally active to exterminate the pest in their orchards. Of course, this is very difficult, when the insects have become thoroughly distributed.

Description and Life History.

The scale of this species is very minute, hardly larger than a small pinhead, approximately circular if covering the female, and slightly elongate, in the male. It is sufficiently transparent to show the insect beneath, and so, at first, is centrally yellow, and later brown or red, while about the margin it is gray. The thorax of the female is much broader than the abdomen, and reaches around and projects back of the latter, so that the insect appears to be deeply lobed behind.

The male when mature, as with all coccids, has two wings. This and its form make it curiously different from the female, or from its earliest self, while it is yet under the sheltering scale.

The life history is as follows: The young may be produced in broods of from twelve to seventeen each, and are being born continuously for several days. We never see eggs except in the abdomen of the partially transparent female, as the young are born alive. We see then that there may be several generations each year, and that they are enormously prolific.

The red scale works on all of our citrus trees, on the rose, apple, peach apricot, and other rosaceous trees, on fig, olive, many palms, sago palm, oak, willow, euonymus, and not a few weeds. I have seen a stem of castor bean so thickly covered with the red scale, as to hide the stem absolutely from sight.

The Yellow Scale.

The Yellow scale is so closely related to the red scale, that scientists regard it as a subspecies, only. It is Chrysomphalus aurantii citrinus. The scale is less convex, not so regular at the margin, less distinctly red in color, slightly more transparent, and the female adheres more tenaciously to the scale, than does the female of the red scale. The most obvious characteristic of the yellow scale, is that it rarely works on the twigs, but only on the leaves and fruit, while the red scale anchors and sucks from twigs, leaves and fruit. The yellow scale is more prone to change its position on the leaves, and so is more likely to be indicated on the foliage, by yellow spots. While the yellow scale is not generally regarded as so serious an enemy of the citrus grower as the red scale, yet in many cases

Red Scale on Lemon.

it is an enemy of no mean rank. Orchards near here are badly injured by the yellow scale.

Parasites and Predaceous Insects.

As yet no parasitic or predaceous insect has served to appreciably lessen the number or work of the red scale in our orchards of Southern California. This is not true of the yellow scale, as the golden Chalcid has in many places seemed sufficient to hold that species in check. As suggested above, the yellow scale about Claremont is not controlled by its insect enemies. This greater freedom from attack by parasites of the red scale, is another important difference between these two species, which in general are so closely similar. While we should strive to secure parasites that would be as efficient to destroy this red scale as is Novius (Vedalia) cardinalis to combat the cottony cushion scale, yet we must not withhold fumigation until some enemy is found that will control the scale. We can never afford to allow our orchards to be victimized by these devitalizing sappers.

With the Citrus Growers

TESTS MADE ON FERTILIZERS.

LAST December the Citrus Experiment Club undertook to determine just what is the true value of the barnyard manure that is on the market in this vicinity. Ten cars of manure were sampled by this club and analyzed by the fertilizer chemist at Berkeley. The following being the analysis:

Kind	N.	P2O5	K2O	Ton Value
Cow and sheep mixed	.66	.44	1.64	$5.00
Corral, No. 1	1.06	.78	2.34	7.77
Corral No. 2	1.12	.68	2.83	8.47
Mean of 2	1.09	.72	2.58	8.12
Barn Yard Manures—				
No. 1	.41	.29	.51	$2.53
No. 2	.44	.34	.58	2.79
No. 3	.46	.35	.50	2.79
No. 4	.54	.41	.70	3.40
No. 5	.52	.40	.83	3.46
No. 6	.59	.36	.68	3.53
No. 7	.53	.34	.96	3.59
Mean	.50	.36	.68	3.17

[N is the symbol for Nitrogen, P2O5 for Phosphoric Acid, and K2O for Potassium oxide or potash.]

These analyses have been grouped into three groups because they represent three entirely different classes of manure. The first sample was evidently from a cow and sheep corral which had dried out a great deal. It was more valuable per ton by reason of the fact that the non-fertilizing element, water, had mostly disappeared.

The two corral cars came from the desert region near Daggett and had also concentrated by losing most of their original water.

The other seven cars were from stables and were typical stable manures.

The value of these manures were calculated by taking the unit values of nitrogen $4.00, phosphoric acid $1.05, and potash $1.16, which is equivalent to by the pound, nitrogen 20c, phosphoric acid 5¼c and potash 5 4-5c.

Anyone familiar with fertilizers would have estimated the first three samples to be far superior to the average barn yard manure, but the same man would have been surprised at the slight difference in the other seven samples. One would have placed these seven very nearly in the order of their analyses by casual observation. The reason for the variation being so slight comes from the fact that materials used for bedding have a composition not so different from the manure itself. The variation in these seven samples was mostly in the straw they contained.

One-half of the nitrogen of manure is in a soluble form, four-fifths of the potash is in a soluble form and only one-fifth of the phosphoric acid is soluble. The value of manure is largely due to the bacteria which manure contains. The bacteria are very influental in rendering plant food available and for that reason most plant food in an unavailable form are improved by being mixed with manure. But no material should be mixed with manure that sterilizes it. The practice of using acid phosphate or other acid materials on manure to conserve the ammonia has been recommended in the past, but is being condemned now. While such practice does conserve the ammonia it kills the bacteria of the manure. The reasonable thing to do is to get the manure into the soil as quickly as possible so that very little ammonia is lost.

Through the courtesy of J. F. Jackson we were furnished the measurements and weights of thirty-seven cars of manure which enables us to estimate the value of manure by the foot. These estimates are of course on the cars and not by wagon measurements. These cars were taken at random so they probably well represent the weight of a cubic foot of manure. These figures show the weight of a cubic foot of manure to vary from 21 pounds to 67 pounds with an average of all 37 cars to be 44 pounds. On the basis of 44 pounds per cubic foot, a composition of .50 per cent nitrogen, .36 per cent phosphoric acid, and .68 per cent potash and unit values of $4 for nitrogen, $1.05 for phosphoric acid and $1.16 for potash, one cubic foot of average stable manure is worth 6.97 cents.—J. H. Norton, Secretary.

DUTY ON LEMONS.

The following editorial appeared recently in the San Francisco Chronicle and is in the main correct. One error is that California's production of lemons is considerably in excess of 1200 cars, but by no means as much as it should be, nor as much as it will be under a little more encouragement. The Chronicle says:

"The present duty on oranges and lemons is one cent a pound. As to oranges, that duty is sufficiently protective without excluding oranges at any season when the domestic supply is insufficient. There were imported in 1907 21,213,745 pounds, which shows that the duty is not prohibitive, but that foreign oranges are kept out by the abundance, excellence and cheapness of our own fruit. As the result of this protective duty oranges, once a luxury, are now articles of ordinary consumption by people of all classes in every town and hamlet in the United States.

"The same duty on lemons has not been so effective. It was in evidence before the Committee on Ways and Means that a duty of one cent a pound has been sufficient to give our California lemons the market as far East as St. Louis and Chicago, which are in fighting ground, but has not enabled them to get much hold in the States further East. The production of this State is about 1200 "carloads," presumably of twelve tons, which would make an output of 28,800,000 pounds, while the importations in 1907 were 153,965,258 pounds, or about five times what we were able to sell. The lemon industry has not been as profitable in this State as the production of oranges, and many lemon groves have been worked over into oranges. Nevertheless our production is gradually outrunning our available markets, and with a little more encouragement within a very few years our domestic lemons would get the American markets as completely as our oranges have got the orange market. Our representatives asked for a duty of one and one-half cents in the new tariff, and in spite of the general tendency to reduce duties, and of the attacks of New York lemon importers, the committee made an increase of one-quarter of a cent a pound on the showing of the figures that the present duty has not enabled us to get more than one-sixth or one-fifth of the American market. The

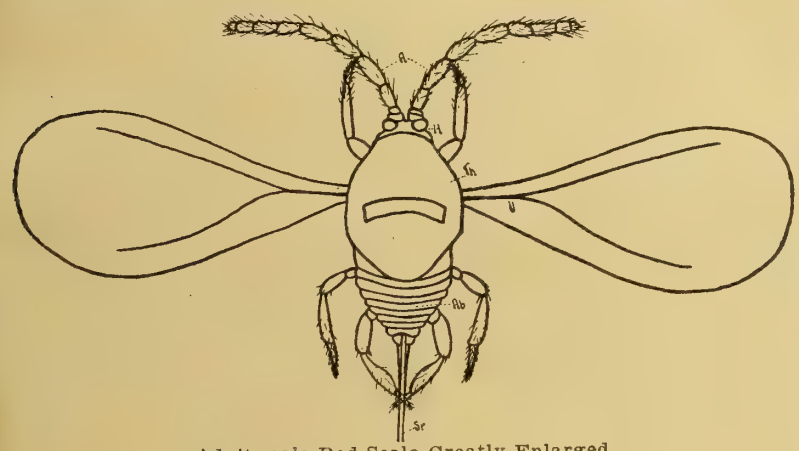
committee was very conservative, and probably did not grant an increase on a single item in which the figures showed that the American product held one-half the trade."

RED SCALE.

(Continued from Page 499.)

Practical Suggestions.

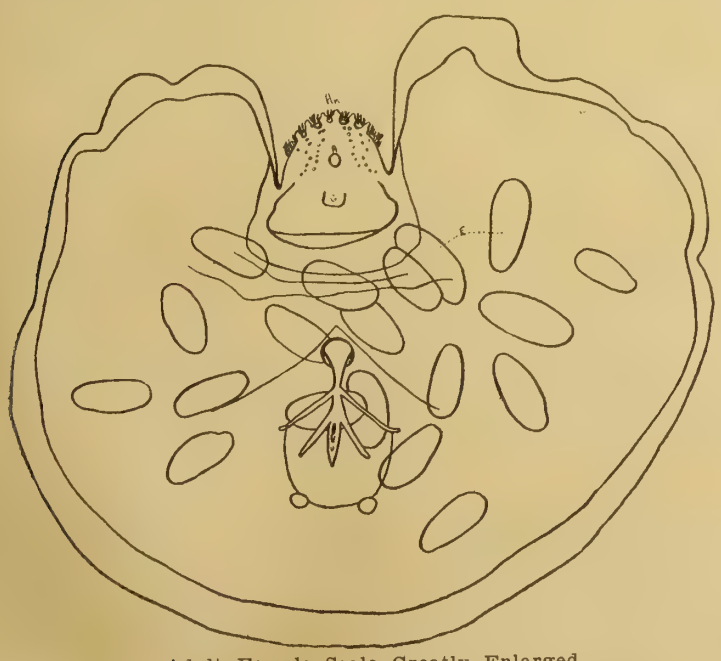
The fact that the red scale is armored, and exists at all times, and in all stages of growth, makes its destruction very difficult. It requires nearly or quite double the black scale dosage and about as much cyanide as does the purple scale, if we would secure complete extermination. At times, even when we are so thorough, it may be wise, to give a second fumigation as soon as we can learn, any scale, as we then kill both the black and the other as well. It is not wise, however, in case the red scale, the purple scale, or the mealy bug are found to be introduced in any region, to wait for autumn, but to fumigate at once. They are all very prolific, and are easily scattered by wind, bird or insect, so immediate extermination should be the watchword, as soon as their presence is discovered. To delay treatment is costly and dangerous, and makes the orchard a menace to all others in the region. For the red, the yellow, and the purple scale, it is fortunate if we can fumigate in summer just after all the fruit is gathered, as then we have only the scale on the leaves and twigs to combat; but as we would hasten if fire was nearing dynamite so we must not delay if we discover red scale in our orchards. For the purple scale and for the mealy bug, double the black scale dosage is required,



Adult male Red Scale Greatly Enlarged.

by examination, that the first fumigation was not entirely effective. The tents must be gas proof, and should remain over the trees for a full hour. They should also in all cases of fumigation, be marked as directed by the Department of Agriculture, that there may be no guess work, and so no possible mistake in determining the amount of cyanide to be used in each case.

As is true of all scale insects, all weeds that may harbor the scale should be kept entirely from the pre-



Adult Female Scale Greatly Enlarged.

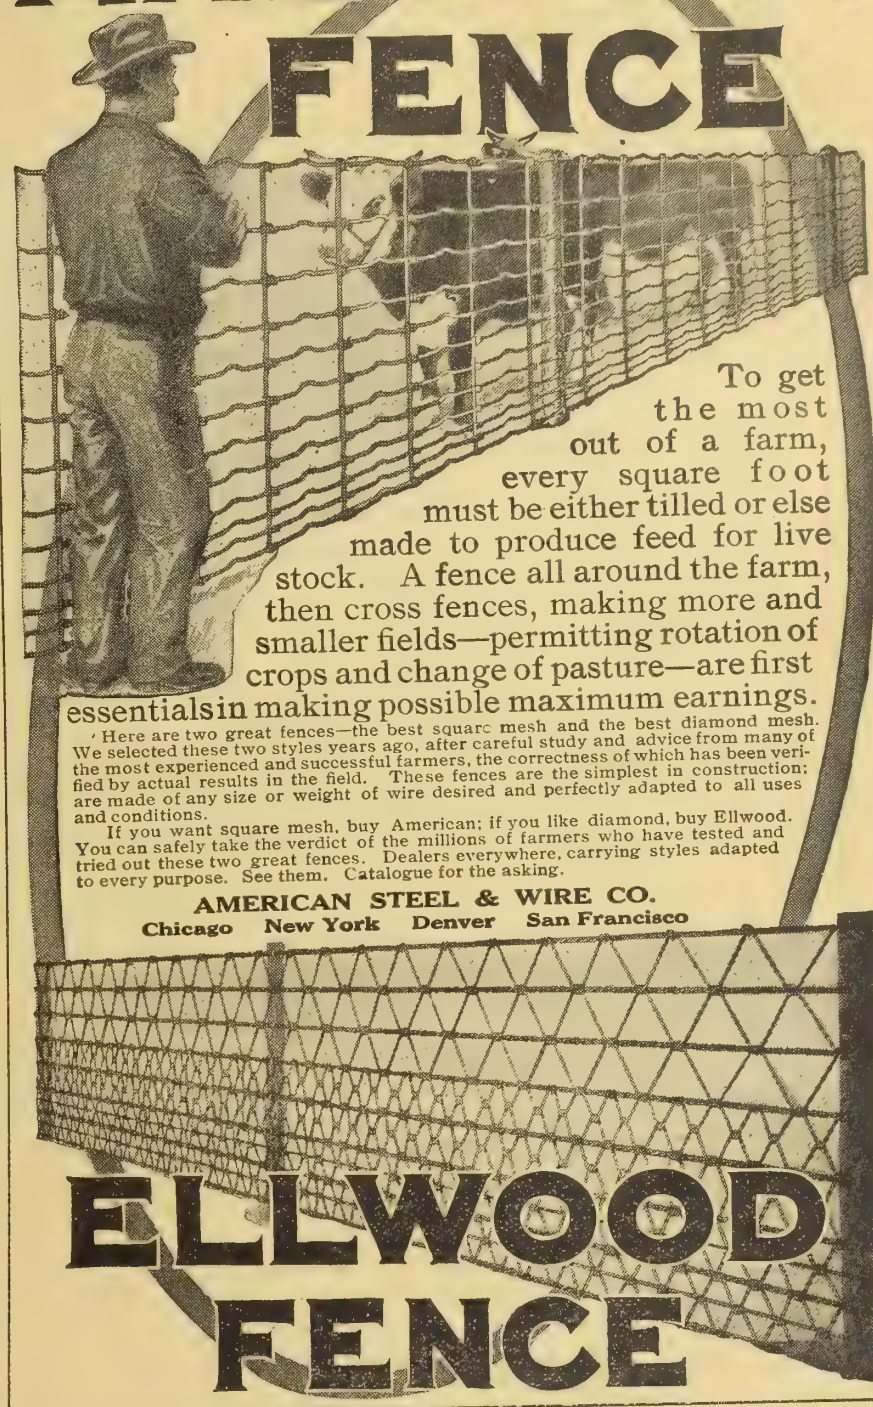
cincts or neighborhood of the orchard. Clean culture, except in winter, when the best success demands that a good cover crop of legumes be grown, must be practiced. In case of red and purple scale, it is wise to gather and burn the fallen fruits. On fallen leaves scale insects soon die, but they live a long time on fruit.

Hints on Fumigation.

Fumigation for black scale may best be done, when all the scale are hatched and still quite young. For our locality this is October and November, though when necessary this may extend from September 1st to February 1st. As there are more or less black scale in all our citrus and deciduous orchards, this is a good time to treat and for the red and yellow scale it may be economy to hit as hard. The Woglum system of marking the tents and amount of cyanide to be used, must be followed. There is no excuse now for any guess work. The loss suffered by our growers in the past, by faulty guess work and too slight dosage, has been enormous. Nor is it enough, as we have been doing, to simply fumigate our citrus trees. We must look after every tree, shrub and plant that harbors the scale in question.

May I, in closing, emphasize four vital points, the observance of which, in the past would have saved hundreds of thousands of dollars to our orchardists; and the observance of which can and must save, in the future, fortunes to our people. First we must have thorough inspection, that every orchardist shall know just the condition of his orchard. Secondly, we must have a sufficient dosage, that will always kill the scale, though the tree is a little burned at times. Third, we must have fumigation by the block system, and thus save the necessity of fumigating oftener than once in three or four years. Lastly, the Exchanges must do the work, as this alone will insure that the scale will always be "hit hard." Absolute thoroughness is the Golden Rule in fumigation.—A. J. Cook, Claremont.

AMERICAN FENCE



To get the most out of a farm, every square foot must be either tilled or else made to produce feed for live stock. A fence all around the farm, then cross fences, making more and smaller fields—permitting rotation of crops and change of pasture—are first essentials in making possible maximum earnings.

Here are two great fences—the best square mesh and the best diamond mesh. We selected these two styles years ago, after careful study and advice from many of the most experienced and successful farmers, the correctness of which has been verified by actual results in the field. These fences are the simplest in construction; are made of any size or weight of wire desired and perfectly adapted to all uses and conditions.

If you want square mesh, buy American; if you like diamond, buy Ellwood. You can safely take the verdict of the millions of farmers who have tested and tried out these two great fences. Dealers everywhere, carrying styles adapted to every purpose. See them. Catalogue for the asking.

Rex Lime & Sulphur Solution
For Grape Mildew

This famous preparation of calcium sulphide has been found to be far superior and cheaper, and easier applied to grape vines for Mildew than Dry Sulphur. It also prevents the Thrip from remaining on the vines; it is a tonic to the vines; is guaranteed to be of a strength of 33% Beaume test with the largest possible amount of the Solution in the penti-sulphide form. It can be used in the dry weather and will adhere to the leaves and will not be blown off by the wind as Dry Sulphur.

Deciduous Fruit Culture

By J. W. Mills

NEW FRUITS OF VALUE.

THERE has been of late considerable criticism by fruit growers in the eastern states of the new fruits and flowers the production of Luther Burbank which have been introduced there.

While the fact that introducers sometimes too highly color and overestimate the value of some of Burbank's productions is deplored by all right minded fruit growers, it still remains true that many of them can hardly be too highly praised. If the many hybrid plums sent out have not proven to be all that was expected of them in all climates it does not follow that they are not desirable in some localities, and they certainly are valuable in California. For several years in succession I obtained from Mr. Burbank some of his new offerings among them the following:

Royal Walnut. I obtained one tree which has been bearing nuts for three years and have a good many trees raised from nuts from Mr. Burbank. These trees show a remarkably strong and clean growth. The nuts are hard shelled and some larger than the Eastern black walnuts.

Paradox Walnut. I have these trees raised from nuts and also some grafted trees from scions from Mr. Burbank's trees. This I consider a valuable tree for shade and road planting. The leaves are very large and fragrant. Even the wood in winter gives forth fragrance readily. It is a shy bearer of nuts which is favorable to it as it will grow to great size the sooner on that account. Paradox on California black will doubtless be a very hardy strong growing and enduring tree.

Santa Rosa Soft Shell. This variety produces a fine nut white and sweet Just how its bearing qualities will compare with other commercial varieties remains to be determined, with me as my trees have only begun to bear. The first two years ago and more last year, but not in full bearing.

Winterstein Apple. This apple has the Gravenstein quality, but comes later thus extending the season of quality apples. My first apples did not take well, but the past season they sold readily and gave good satisfaction.

The Primus Berry. This berry should have a place in every family garden. It is early and sweet with a decided wild flavor. Best of all for canning. A little too soft for long distance markets.

The Phenomenal Berry. This is the popular berry of today, larger than the Logan and not so sour. Keeps its color and stands up remarkably for so juicy a berry. A fine grower and easy to pick which means profit to the grower for market.

The Pineapple Quince. This fruit is all that has been claimed for it. Large, smooth, easily cleaned, tender, free from grit and delicious flavor. We have no use for common quinces since the Pineapples began to bear and my fruit customers call for them at a higher price. When fully ripe they may be eaten like apples. For canning this quince is very acceptable. These are some of Mr. Burbank's fruits that are a success with me . I have a number of varieties from other sources that I am testing. —Horace G. Keesling, San Jose.

* * *

It is true, as Mr. Keesling says in the above article, there has been much criticism in eastern states as to the attitude of Mr. Burbank and his supporters. We may probably add there has been still more in California. Many regard Mr. Burbank as unfortunate in having friends who pour forth their praise in such liberal chunks that it has become sickening to those who look at the real worth of his productions. The spineless cactus seems to be such a collossal fake that it will affect many people's

judgment as to the worth of a few of his productions that may live many years. It is unfortunate that this fulsome flattery has been poured upon him to such an extent that it has so nauseated people. This does not refer to articles written in the spirit of Mr. Keesling's. It is yet rather early to definitely proclaim the commercial worth of some of these fruits. There are others besides those mentioned by Mr. Keesling, notably the Sonoma, Santa Rosa and other plums which have been on the market for several years. Whether these fruits will bear and be a product of large commercial influence, will have to be proven. The trouble is that the whole Burbank proposition, including his name, is being commercialized to such an extent that great injury will be done to a large number of people who buy on the strength of a name and, besides, true experimentation and investigation will be discouraged.

"SHADE CROPS."

THE CULTIVATOR has heretofore had articles on "cover" crops or "green manure" crops, also by Mr. Geraldson on a method of orchard culture in which crops were allowed to grow in orchard and ripen and die on surface instead of plowing under green.

Somewhat along the same line is the following by W. Paddock of Colorado Agricultural College:

All intelligent fruit growers know that Colorado soil is deficient in decaying organic matter. The effects of this condition are seen in the compact, puddled soils, which are almost universally present in the orchard districts, except where sandy land is found. Then, too, in the older orchards we find that the fruit is running small in size, so that it is becoming more and more difficult to get satisfactory prices for the product.

The necessity for maintaining fertility in our orchard soils for a considerable time, at least, seems largely to be a question of maintaining the soil in proper physical condition. The effects of our climate are such that when vegetable matter of any description is plowed into the land it is soon exhausted. It seems to be burned out by the intense sun and the dry air. We are dependent upon organic matter for the degree of fibre and tilth that is desirable in our soils The soil is lifeless without decaying matter. We need this material to aid in setting plant food free, to provide a home for the various forms of germ life which perform many important functions, and to give fibre and tilth to the soil.

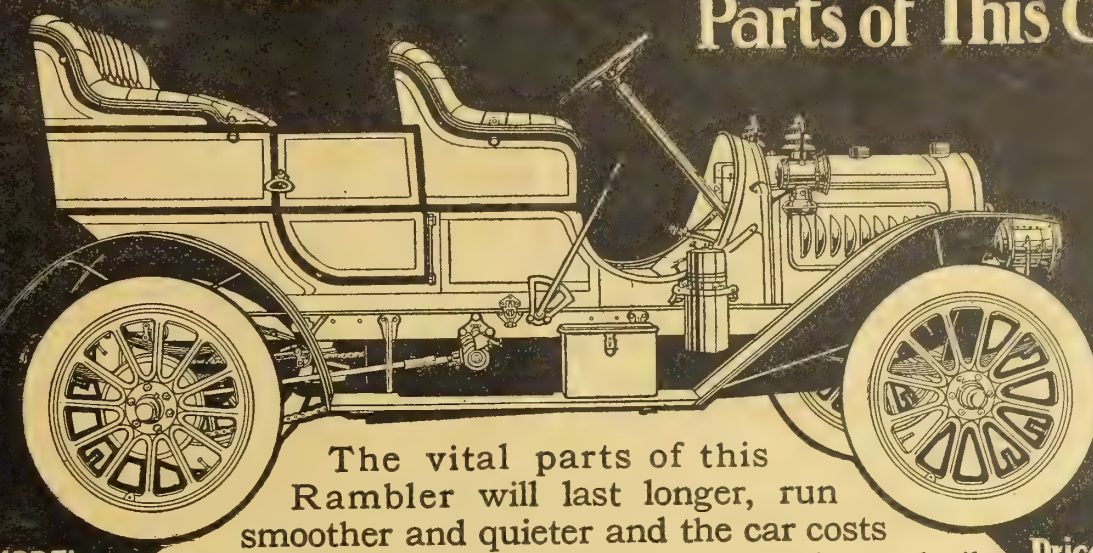
Since organic matter seems to be dissipated by the action of the sun it stands to reason that if the soil could be shaded during the heat of the summer, much of this valuable material could be saved. We are therefore advocating the use of a crop in the orchard during the growing season, thus shading and protecting the land from the intense heat of the sun. As this crop has a somewhat different use from the cover crop of the East, we have coined the phrase "shade crop" to distinguish it from the former. It performs all the functions of a cover crop, and has the added usefulness of shading and protecting the land during the heat of the summer.

The system of shade crop management and the plants to use has not been thoroughly worked out; but a great many orchard men are giving it a trial, so it is probable that within a few years we shall have a definite Colorado system of orchard culture. In the meantime it is permissible to predict that the management will be somewhat as follows:

Plant the seed in the spring of the year and plow the crop under the following fall, or, in some instances allow it to remain two years before plowing, depending upon the condition of the land and of the trees. Fruit growers have now generally come to the conclusion that orchard land should be frequently plowed and preferably in the fall of the year, for the reason that if plowed in the spring, particularly if a large amount of green manure or stable manure is to be turned under, difficulty will be experienced in irrigating. This mass of material turned under in the spring prevents the spreading of water to such an extent that the trees nearest the main ditch are often injured before the water can be forced to the lower ends of the rows.

The kinds of crops to grow will depend upon the condition of the orchard. Usually a leguminous plant such as red clover may be used to start with, for the reason that it is able to take nitrogen from the air. If, after plowing under one or two years, it is found that the trees are making a too vigorous growth, some other plant may be used, such as rye oats, or buckwheat.

Mud or Water Cannot Get into the Working Parts of This Car



MODEL FORTY ONE

Price $1350

The vital parts of this Rambler will last longer, run smoother and quieter and the car costs less to keep up than any other two-cylinder car built.

The Rambler unit power plant, and every working part, is enclosed for protection against mud, water and injurious road materials.

An oil bath for moving parts muffles noise and keeps parts perfectly clean.

This exclusive Rambler feature is indispensable to the man who wants a car that will travel over all kinds of roads. The Rambler is built to meet all road conditions. It's double opposed motor makes it the greatest two-cylinder hill climber in America.

Rambler

THE CAR OF STEADY SERVICE

Clearance—This car has 15¾ inches clearance between the axle and the ground, which is more than any other. Large wheels and long wheel base permit comfortable driving over uneven ground; big tires last longer, and cost less to maintain. Straight axles enable it to travel over dirt roads a foot high in the center or a foot deep in ruts. Full elliptic springs add comfort.

Sheet steel mud apron protects carbureter, timer and other mechanism from water and dirt.

You can in a moment reach every part for inspection, or adjustment—a great convenience and time saver.

Take tonneau off and you have a two-passenger roadster for quick trips, or for the young people—take off torpedo deck, and you have a powerful handy and light runabout with spacious rear platform for carrying anything.

Rambler brakes have nearly 400 inches of braking surface. Operation is simple—only one lever to handle—motor has three point suspension, and is set in center of chassis—providing low center of gravity—perfect balance and no vibration.

Built in the largest automobile factory in the world—the product of thirty-five years of manufacturing experience, and endorsed by hundreds of farmers, who have bought Ramblers—this is the **standard car for farm use.**

Please let us send you our new illustrated free farm folder No. 156 In it Rambler owners tell why they bought this car, how much it has cost to keep and the many ways in which they use it. Full of striking photographs, and interesting information for farmers. It's instructive. Write today. You will not obligate yourself.

The Ornamental Garden

INTRODUCTIONS FROM AUSTRALASIA.

IT HAS been stated that the first Eucalyptus were planted in California in the year 1856, but, it was only towards 1870 that their planting became generalized. It is to the energetic and cosmopolitan propaganda of Baron Von Mueller, powerfully seconded at Santa Barbara by the Hon. Ellwood Cooper, that California, not unlike other countries, is indebted for the introduction of Eucalyptus, which it is safe to assert has benefitted California more than any other country. When such introduction was started the extensive forests of live oaks which covered the largest part of California over a century ago, had, most unfortunately, disappeared, chiefly through fires intended to clear the ground for grazing purposes. Without the introduction of the Eucalyptus the wonderful development of this country would have been altogether impossible.

It is estimated that not less than seventy different species of Eucalyptus were grown in California in 1894, which number was considerably increased since, and it is safe to predict that the planting of kinds yielding the best class of timber is going to make great strides in the next few years.

The different species of Australian Acacia, which had been introduced mostly for their tan producing properties, were not much utilized in this way, but they have become one of the most conspicuous ornaments of our gardens, where they bloom most profusely during the winter months. Not a few of the most ornamental kinds were first introduced by ourselves, like A. Baileyana, A. Elata, A. Grandis, A. Obliqua, A. Podalyriaefolia, and others.

We have now growing at Santa Barbara not less than 18 different species of Palms from Australasia, some of them being among the choicest ornaments of our gardens. It was our privilege to be first to introduce the very peculiar "red palm," Livistona Mariae, from the interior of South Australia, quite striking for the coppery red color of its fan shape leaves. Other Australian plants worthy of special notice and of our own introduction are, among fruit bearing trees, Achras Australis, Owenia Cerasifera and Spondias Solandri; among shade and ornamental trees, Ficus Cunninghamii, Rhus Rhodanthema, Sterculia Bidwillii and S. Gregori. In addition to the Acacias mentioned above, we have also introduced the famous "waratah," Telopea Speciosissima, Stenocarpus Salignus; also several species of Hakea, Melaleuca, Myoporum, and Pimelea, all of them much welcome additions to our garden flora.

From New Zealand we have introduced the pretty Carmichaelia Grandiflora, Hymenanthera Crassifolia, Maccropiper Excelsium, and Sophora Tetraptera.

From New Caledonia, the pure white, winter flowering Oxera Pulchella; from the island of Guam the most remarkable local "screw pine," Pandanus Fragrans; and from the group of the Hawaiian islands the very pretty and most interesting Osteomeles Anthyllidifolia, with foliage of Anthyllis and flowers and fruits of Crataegus; also Santalum Freycinetianum, now almost extinct in those islands, Myoporum Sandwicense with wood scented like the true "sandal wood," Myrsine Lessertiana, Pittosporum Hawaiiense, Sophora Chrysophylla, and others.

With increased facilities of transportation a much larger number of interesting plants from Australia and from other parts of Australasia are sure to be added in the near future to our garden flora.—Dr. F. Franceschi in The Pacific Garden.

THE EASTER LILY.

The lilium family is surely one of our most interesting and beautiful of all plant creation. Their conspicuous flowers, striking colors and their stately forms appeal strongly to the eye and to the imagination as well. They are among those good old-fashioned plants which frequently and justly come newly into vogue. Lilies are less understood and less discriminatingly appreciated than almost any other plants of prominence.

The Easter lily—Lilium Longiflorum, also Lilium Harrisii—is a tall large-flowered form, pure white, that is most commonly forced by florists for Easter sale. This variety was introduced from Bermuda about 1875. A Philadelphia woman in returning from Bermuda brought with her two lilies in bloom and presented them to a local florist. The bulbs were increased to 100 in the next three or four years, when the plants were seen by W. K. Harris, an enterprising Philadelphia florist. The earliness of blooming and prolificacy of the bulbs were striking features and led to their purchase by Mr. Harris. In 1882 the lily was introduced under the name of Lilium Harrisii.

In 1882 it was also introduced by a Philadelphia florist under a long Latin name and later by a New York florist as the Bermuda Easter lily.

To botanists it is known as Lilium Longiflorum var eximium.

In California the Easter lily does nicely when planted in the open ground, but will not come into bloom until long after Easter, usually about June.—Pacific Garden.

FOLIAGE, NOT FLOWERS.

It is the absence of unsightly fences, I am told, and the substituting of green hedges that makes the country lanes of England so pleasing to the American tourist. To my way of thinking, foliage, and not flowers, should be the prime factor for public beautifying. Every shade of green in plant life harmonizes with every other green shade, and harmony is the keynote of art, whether in doors or out. This is not true of blooms, any more than it is true of dress goods. Select any half-dozen varieties of vines, shift the grouping as you will, and after every change harmony will prevail.

Again, I favor vines for public places because they climb and creep and twine in and out and all around the unsightly surfaces, rough angles of fences, old sheds, bare brick walls and the dozen and one other hideous structures that make a city anything but lovely.—Mercury Herald.

A review of the Portland hop market shows that the new crop will come on a comparatively bare market which gives some hope to the hop men.

Small Fruits and Vegetables

THE CHAYOTE OR PORTUGUESE SQUASH.

IF YOU were to ask your rural friends what they still lacked in the garden, they would probably answer; a vine which would grow fifty feet in a summer and furnish good shade, bear a heavy crop of a first-class edible nature and disappear in the winter of its own accord, growing out again in the spring without much coaxing to repeat the operation in a surpassing manner. And they might add, thoughtfully, that should the fruit keep fit to eat a long time, so that it could be dished up on their spring, as well as on their fall, tables, so much the better.

This, yes this, is all done by the **Chayote** or **Chocho**, or **Chuchu**, or **Chow Chow**, or **Cahiota** or **Pepinella**, for by one or other of all these names is it known in various parts of the West Indies and South America, where it drapes the poor man's cabin and fills his platter.

More than that, if the aforesaid poor man decides to change his place of residence, he can dig up the immense tuberous root of his favorite Chayote, and invite all his old neighbors to a farewell feast for it is also edible and even more prized than its fruit.

The botanical name of this culinary prodigy is **Sechium edule** and it belongs to the one-seeded Cucurbits. The vine has tendrils and climbs readily, making a rapid summer cover for back porches, arbors and chicken yards. The leaves are large and like those of the cucumber. The flowers are greenish or creamy in color, and come in two families; the male flowers are in long-stalked clusters, the female are solitary or in pairs on a short stem. The fruit is four to six inches long and may weigh up to three pounds; it is shaped like a flattened and ribbed pear, has a thin, smooth, shiny skin and is somewhat spiny. They begin to ripen in August, and are produced until the cold weather of these parts kills back the vine.

The fruits can be cooked when picked, or stored away, to be used as needed during the winter.

Two year old vines and even one year old ones have borne upwards of 500 good fruits each this season in Pasadena and had plenty of immature fruits on when the tops froze. With protection on extra cold nights the vine would probably continue to ripen fruit during most of the winter. The fruits are usually cooked in the same way as summer squash or vegetable marrow and taste very much the same as these; in fact those who have sampled them here say, even better. They can also be baked, used in salads, or prepared in a variety of ways for the table. The root forms a large corky tuber and, by many in the tropics, is preferred to the yam, which it resembles.

The single flat seed is one to two inches long, and cannot easily be removed from the fruit; so the entire fruit is planted.

The fruit can, if kept dry, be carried over winter, and will often sprout more or less in the meantime, without being spoiled for planting.

There are many varieties, ranging in color of fruit from green to white. Green fruits are so far the more common here, but white ones have also been introduced and promise to sell better on their looks.—Pacific Garden.

FOR "GREEN CORN."

As a list of desirable varieties of corn to plant in this state, the Pacific Garden gives the following:

The two drawbacks to the enjoyment of the fruit of the cob in this climate are cold nights and grubs. The first mentioned we cannot offset, nor the second either perhaps, though it has been noticed that early and late sowings are more free from grubs than the mid-season crop. The varieties that can be recommended are in the order of their earliness:

Peep o' Day.

Very small cob, but very sweet and worth while planting in a limited way as a starter.

Golden Bantam.

The best all-round family sort. Not a large cob (6 inches) but the sweetest of all. The kernels are plump and yellow. It is as free from grubs as any and can be planted early and late. Last season in Pasadena it won opinions as golden as its color. It will give you corn before you leave for the beach. Do not fail to plant Golden Bantam.

Early Crosby.

Back east this is a favorite among the large medium early sorts and has been for many years. It is worthy of trial here. (7-inch ear).

Early Mammoth.

The most popular variety in this state for main early crop. It is considered very free from grubs and of excellent quality. A heavy yielder of good sized ears (8-inch) with large kernels.

Black Mexican.

The way this is called for by our old residents proves it to be a good corn to plant here-abouts. Plucked at the right stage it is extra tender and sweet, and the grubs don't seem to know it. (7 inch ear).

Country Gentlemen.

The "shoe-peg" corn. Considered east and west the sweetest and meatiest of the big-sized late kinds for family use. (8 -inch ear).

Oregon Evergreen.

A Pacific Coast kind which the Los Angeles seed men say is the favorite with their market growers. It sustained its reputation last season as to quality, yield and perfectness. (8-inch ear.)

WORKING TOO HARD.

The owner of the farm had been enjoying himself at the county fair, while his hard-working wife stayed at home to see that the farm suffered no loss in his absence.

"Well, Sarah," said the owner upon his return, "I'm about all tired out. Is the cows in the barn?"

"Yes; long since," replied his wife, barely looking up from the task then in hand.

"Is the hosses unharnessed an' fed?"

"Yes."

"Chickens locked up?"

"Yes."

"Wood chopped for mornin'?"

"Yes."

"Wagon wheel mended an' ready t' start in th' mornin'?"

"Yes."

"Well, then," concluded the exhausted owner, with a sigh of relief, "let me have my supper. I'm goin' to turn in. Farmin's beginnin' t' tell on me."—New York Herald.

WHAT'S the matter? Why, there's a poor lubricant on the axles, and the wagon drags, the horse pulls hard, and the driver is annoyed.

MICA Axle Grease

will end such conditions. It's all the difference between easy riding and hard going. It's like ball bearings in the wheels, or a push behind, or a double team on a one-horse rig.

It's the lubricant that ends axle troubles and it's *best* for all wagons, light or heavy.

Ask your dealer for Mica Axle Grease and prove it.

50,000,000 Americans Expect to Die in California

Several Millions of Them Will Not Get Around to It in Time, but a Great Many of Them Will

People who have come to California in the past have not been driven here by "land hunger." They have come here to spend money rather than to make it. Thousands of them have acquired city homes, winter homes, mountain homes, and homes along the sea—homes that would afford them pleasure and luxury, but the thought that they could have these things, and yet make money out of their purchases seldom occurred to them. Up till quite recently California has not been held up to the easterner as a land of agricultural possibilities. And so the domain east of the Rockies is packed with people who expect to come to California when they can "afford to," but till then to remain where they are.

Of late, however, the information has gained ground that the "New California" is peculiarly a land of agricutural opportunities, the likes of which the land hungry have not had a chance at before, and California is rapidly becoming **the** Mecca of the homeseeking millions of the east. They are coming here in greater numbers than ever before, and the influx has but started. It will gather strength with time, because everyone who comes here and sees the wonderful possibilities in rural home making brings others, and they in turn will induce friends to come. In short what took place in the prairie northwest is beginning to take place here.

A Leaf from Experience

To show what we are up against here let us see what has happened in the prairie northwest in the last ten years. Up till that time the original settler held those rich lands undisturbed. His lands had cost him little or nothing, and he valued them in proportion. He knew the land raised him good crops, but he never stopped to figure that they were worth that what they would pay interest on. Neither did he stop to think that productive lands are very limited and that it will not be long till North America will have to hand out the sign "Standing Room Only. Productive Lands All Gone." He did not stop to reason out that we are up against a limited supply and an ever increasing demand, and that the inevitable consequence is high prices—productive lands selling from the hundreds in the grain raising sections of the east to the thousands in the irrigated fruit and alfalfa sections of the Pacific coast. He slept in peace and quiet.

The congestion in the extreme east became oppressive. These people came to appreciate productive land because it was scarce, and so they began to filter through the prairie northwest, buying the cheap lands there. The original occupant sold at most any price. He did not know what he had, so he gladly took anything offered him, supposing that he could go almost anywhere and "take up" a few more quarter sections at his leisure. He awoke to the fact that free productive lands in the U. S. were gone, and that he had squandered his birthright, and straightway he was consumed with land hunger.

This process continued and in ten years land has climbed from $5.00, $10.00 and $15.00 per acre to $50.00, $75.00 and $100.00 per acre, and are still going up. And this in sections where the highest priced crop possible is wheat and corn, and where farming is more a matter of luck than science, on account of climatic conditions.

And so it has come to pass that in the past ten years the great empire of the Canadian Northwest has been populated by the overflowing, land hungry of the U. S. The semi-arid plains of the central west, that up to a few years ago were given over to ranging, are now dotted with the shacks of the land hungry, and the movement has only begun.

They Want Something Better

But thousands of those who have "sold out" under the sky farming system of the east have come to know that there is something better, something surer, and something that eliminates most of the uncertainty incident to his old methods. That something is irrigation. And so for a few years back the overflow from the prairie west has been going onto the numerous irrigated projects of the north coast country, till lands there have risen in value up to as high as $3,500 per acre.

California has felt this movement principally in the older sections where easterners have slowly drifted in, secured a few acres of land and as surely raised the value till now certain sections south of the Tehachapis are full and prices of productive lands are going up, till in some communities they have become almost prohibitive.

In other sections, however, the original settler is still sleeping alongside his opportunities, allowing the land hungry easterner to come in and take his lands at a price about equal to the price of one normal year's crop.

The Only "New West"

About the only remaining "new west" is the "New California"—the San Joaquin Valley—a domain that for agricultural possibilities probably has not an equal today. Here we yet have "ground floor" conditions—here the best of lands can yet be had at about the price of one year's crop, and it is this valley that is attracting the attention of the land hungry east as it has not been attracted before. Since last fall hundreds have come here to investigate and hundreds have invested and are now residents of California.

Each one of these is bringing more, and in the near future the character of the population will be changed; in the near future there will be a density of rural population here that will surprise the most sanguine, and there can be but one result.

The Inevitable Result

Density of population means high land values. This is an incontrovertible proposition. Put a million people on Gibralter and the absolutely barren rock could probably be sold for $500 per front foot. Land values increase in the same ratio as the population. The only element that has been lacking in the San Joaquin Valley has been population—everything else is here. Now that the people are coming the good lands will increase in value, and the increase will come rapidly.

Are the People Coming?

As answer to this question note the record made by the **Kerman Tract.** Since last November more actual occupants have bought on this tract than on any other irrigated tract on the Pacific coast. More than this: If any irrigated tract on the Pacific coast has ever made a similar sales record in the same length of time, the record is unheard of. And these sales have been made to actual settlers and not to speculators. And the making of this record is no accident. It is the result of the inherent merits of the tract, and very few prospective buyers have looked over the land without buying.

This tract has the **location,** being on the main line of the S. P. and but a few mile distant from a city of over 30,000.

It has the **soil,** it being a sedimentary deposit, deep, mellow and full of plant life. It is peculiarly an irrigable soil, being sufficiently porous to furnish the best of circulation for both air and water, and preventing undue evaporation. The tract is level, so much so that on the orignal tract of 36,000 acres there is not a foot of fluming.

The **climate** is ideal for the production of semi-tropical fruits and alfalfa. The products natural to this tract are of the character that bring the high prices and that are destined to increase as time goes on. Owing to the dryness of the atmosphere there is a noteworthy absence of insect pests, that so often make fruit growing difficult in the more humid sections.

The **water right** is not surpassed, if equalled, in the state. The system drains the famous Mt. Whitney region, the highest watershed in the United States, which insures an abundance of water during the middle of summer when it is most needed. It is cheap, ample, fully guaranteed, appurtenant and perpetual. The system is not on paper only, the water to be delivered sometime in the future. The system has long been in use, and the water awaits the rancher at the line of his land.

The **drainage** is such as to insure immunity from seep or subirrigation. The San Joaquin river borders the tract on the north, precluding the possibility of a troublesome rise in the watertable in the land.

The **prices** are $110.00 and $150.00 per acre, with terms so arranged that people with small capital can secure a home and competency for the future. Our literature gives full particulars as to plan of selling.

Now is the Time

There is no surer investment than good irrigated lands in California at this time. There is but one California and there can never be another, and there is a world of people that would like to live here. We are on the eve of the greatest land movement in California, and those who expect to secure their acres while they are yet cheap will do well to act now. There is absolutely nothing to be gained by waiting, and there is everything to lose. As soon as the rush gets general and lands move generally, prices will begin to soar, and that time is already setting in. And those who come first get the most advantageous selections. It matters little whether lands are wanted for actual occupancy or for investment—now is the time—not next year. The results are sure. The buyer of Kerman lands now will be the capitalist of tomorrow—he cannot help himself if he buys now and holds for the rise, improving the land in the meantime.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. Minna E. Sherman

GARGET.

THIS trouble is known as mammitis by the veterinarian and is an inflammation of the glands of the udder. It may come from natural causes of an excessive flow of milk in an undeveloped udder. This frequently occurs in the heifer with her first calf. In heavy producing strains of cows this has forced the dairy man into breeding early in life instead of waiting for fuller maturity in the animal. This has in the long run proven to make the breeds weaker and to reduce the health or rather stamina of the strain. The younger heifers have the udder in a more plastic form than the mature cow, and not having the great amount of blood force do not take the garget. At 24 months old the growth of the animal has in a way kept her from making too much milk at first. The udder is still growing and it increases in capacity as fast as the milk-forming power increases.

When the older cows have attacks of garget, the milking should be looked after first of all; carelessly leaving a little milk behind in the udder while the milk is increasing, will bring on garget. Rough handling is another cause. Not necessarily intentionally rough, but any hard pressure or jerky milking. Sticks and milking stools are sometimes the cause in the hands of an irate man. Don't keep a milker that has a chronic grouch. Oh! for the milker that sings to the cows as he milks them! The heart full of joy makes loving kindness easy in the stable and barn. Horns on the head of a boss cow will often be found to be the cause of garget in some of the herd.

Early Milking.

In a heifer herd watch the springers and if the udder fills up with milk before the calf is dropped, milk the heifer the same as though she were an old cow. We have had many of these cases in our herds; the cow Romeo Aggie Acme was giving two gallons of milk at a milking before she ever dropped a calf. This did not prevent her making a record later of 26 pounds of butter in seven days. Fidessa was another cow that was in milking before she freshened with her first calf, she was first prize for two years at the Sacramento Fair and made 25 pounds of butter in seven days afterwards. I am giving these two instances of cows of my own herd and could multiply them by twenty or thirty more on the ranch books. Had these heifers not been milked when the milk first came without regard to the time, they would not be fresh, they would never have made any records worth while. Garget would have taken a part of their productiveness away.

Simple Cases.

Many simple cases of garget in the family cow come from cold. A blanket after calving that covers the cows flanks well might save her from an attack. The treatment is first to put the cow on dry feed. Alfalfa hay is to be preferred. Feed no grass or other food likely to stimulate the milk flow. One and a half pounds of epsom salts, four level tablespoons of ground ginger, shaken up in two quarts of cold water as a drench. In drenching an animal care must be used not to get the fluid into the lungs. If you have never drenched one have some one show you how it is done first. Add a tablespoon of saltpetre to a gallon of drinking water for two or three days. The epsom salts may be repeated if necessary and if the cow is fat. The fluids or watery portions of the blood are worked off in this way through other channels than that of the udder.

Hot Water.

The udder is an extremity and can be stimulated to work by continuous bathing in hot water. One hour three times a day is not too long to reduce the inflammation, for garget is not a trouble that will wait. It must be attended too promptly or the cow has a spoiled quarter to her udder. After bathing the udder, rub on vaseline or cold cream to close the pores and prevent further cold. A mixture of half an ounce of sulphate of zinc and the same amount of acetate of lead in a quart of water, can be used until the inflammation has passed to bathe the udder.

A simple way to handle these cases is to allow the calf to nurse. Watch the cow closely and see that the calf takes milk from all the teats. Heifers are sometimes very rebellious in being milked when the udder is tender, for these the tiny calf is the best milking machine, for the mother love will bear pain to nourish the little one.

Remember that the cutting off of foods that are disposed to produce a heavy milk flow will help these cases greatly. After the inflammation has passed from the udder, begin to feed the milk making foods again, but do so slowly taking, at least, a week to get the cow back to the regular feed again.

Steaming.

In bad cases an udder can often be saved by the use of steam. The cow is brought to the engine house and secured by a strong halter. A heavy horse blanket is folded length wise and put over her body half way to her shoulders. It is fastened with large safety pins on her stomach and at the rear of her flanks. The blanket should be long enough to reach nearly to the ground and pinned into a bag under the udder. An attendant sits down on a stool at her side bares his arm and takes the steam hose in his hand and puts hand and arm into the blanket. This is done so that the steam is never too hot, for the man feels it as well as the cow. The steam is turned on a little head and kept going for half an hour.

The milk is drawn while the udder is relaxed from the heat. I prefer a milking tube to putting any pressure on the udder in these cases. The udder should be protected with a piece of cotton batting with holes cut in it for the teats. Over this put a sack with the same teat holes, by splitting the sack length wise it will be long enough to reach up on the cows back. Sew it there firmly, or pin it with the safety pins.

Often one good steaming with the

Cream Separators

Don't buy a cream separator without being sure you KNOW what you are doing.

Making a mistake in buying a cream separator means a great deal—it means waste of time and butter-fat twice a day, every day in the year, if you get the wrong machine,—until you "scrap" the machine itself.

More than 15,000 users who had made such a mistake replaced their "mistaken" machines with DE LAVAL separators during the year 1908.

They had probably wasted Five Million Dollars worth of investment, labor and butter meanwhile.

If you feel inclined to buy some other make of separator by all means do so, if you can find any apparently good reason for it.

BUT why not TRY a DE LAVAL machine beside the other machine for ONE WEEK before you actually contract to buy it? Simply SEE the comparative operation and comparative results and examine the comparative construction.

That's a proposition open to every intending separator buyer. Any DE LAVAL agent will carry it out. WHY not avail of it and KNOW what you are doing before making this very important investment?

Don't let any alluring "catalogue house" literature or clever talking agent wheedle you into buying any other separator without FIRST actually TRYING it alongside a DE LAVAL.

In other words, buy your separator intelligently and knowingly and not on blind faith in anybody's representations.

dose of epsom salts and a little care in the diet, will cure the case. The safety pins used around the stables and barns are large, heavy ones two, three and four inches long. They come to pin the bed covers over fever patients and are useful around the house in many ways.—M. E. Sherman.

THE HOG OF TODAY.

The hog is more of an individual than a machine, and his breeder should treat him as such. Methods which may be accepted as established have been worked out in swine breeding, but adherence to all of them cannot, for many practical reasons, be rigid. The breeder himself, his breeding stock, environment, feed resources, climate and other factors are so largely involved that one man's success may spell another man's failure. A common-sense type of hog in the hands of a common-sense breeder constitutes a combination best calculated for satisfaction and profit during a succession of years.

Live stock husbandry represents a high type of constructive effort, and swine breeding offers as much satisfaction and gain as any other branch. It may profitably engage the attention of the man who raises hogs merely from financial motives, but a breeder who attains a foremost place in his calling has an interest in his business not inspired solely by rewards in money. The compensations of swine raising are ample for the man who desires to make his work a profession, as hundreds who have a just pride in their achievements can testify.

Intelligence used in his breeding and care has raised the hog from the plane of the veriest savage, unsought except when hunted like any other wild beast, to that of a benefactor, contributing a wide variety of meats, among them the most toothsome known to the epicure, and other products essential to the best tables, to commerce and the trades. The hog's disposition has yielded to the influence of good breeding and changed from that of the outlaw, ready for conflict with man or beast, to the peaceable temperament belonging with propriety to the barnyard resident. His conformation has been molded by skillful methods from bony, angular uncouthness into a structure of massive width, depth and thickness, affording a marvelous yield of pork and lard. Incidentally, by domestication and generations of breeding him for early maturity and quick fattening, the length of his intestines has been increased, it is claimed by scientists, more than 130 per cent.

Swine are as susceptible as other animals to the influences of environment, and three or four generations cover a period long enough to bring about great changes in them. Experiments made at the Wisconsin station in crossing the wild or Razor-Back hogs and their crosses with the improved and approved breeds showed that a marked improvement in appearance and quality in the wild hogs progeny was possible, although in constitution and gains of flesh they did not compare with pure-breds, and when cholera struck the station herds these supposedly hardier hogs were the first to succumb. Their feeding habits were irregular; on one day they would gorge themselves so that they would be found fasting for the next day or more. These compelling forces of heredity made plain that both right breeding and right environment are essential to the attainment of right results. At the same time environment may be, in some cases, as destructive in its results as in other cases it is beneficial. Swine typical of the best breeding require but two or three generations of wrong environment to degenerate to the level of the most unapproved types. Much, therefore, depends upon the breeder and his provisions for and care in handling.—From Coburn's "Swine in America."

AN OUTSIDE VIEW OF HUMBOLDT COUNTY.

A recent issue of Hoard's Dairyman has an article by Hon. Levi Wells, of the United States Department of Agriculture, on the subject of dairying as it is conducted in the famous Eel River valley in Humboldt county. There are a number of features mentioned that will prove interesting. The article calls attention to the remarkable showing of 8,500 cows being kept on 10,000 acres of land. This is about correct. There are probably many places in this country where an acre of land supports a cow without the necessity of purchasing any feed, but we doubt if there can be found another district containing 10,000 acres located together that supports 8,500 cows as is the case in the Eel River valley of Humboldt county. No wonder such land rents for $20 an acre and sells at upwards of $300. It only takes the right kind of a cow to make good on it.

In this connection The Pacific Dairy Review would call the attention of Mr. Wells to the fact that remarkable as the Eel River Valley is for the production of cow feed, there are some millions of acres in California capable of doing the same thing. All they need is the development of irrigation enterprises and an intelligent, energetic class of dairymen to make use of these millions of acres.

Many of the best class of dairymen in Humboldt county will not be pleased to learn that a government official of high standing has held the dairymen of that county up before the public as a particularly bad lot when it comes to the matter of the sanitary conditions that they maintain at their dairies and in their creameries. Mr. Wells says that the sanitary ideals are very low in Humboldt county dairying. It is too bad that conditions maintained are such as to warrant such a statement going out over the country, but the fact is there is considerable truth in it and we hope our Humboldt friends will pardon us for repeating it here, and we do so only in the hope that our calling attention to the matter will not only wake up our dairymen in Humboldt county, as well as elsewhere, to the fact that it looks bad and is unprofitable to have low sanitary ideals in the dairy business.

Humboldt county has the best lot of dairymen in the country when it comes to handling cows for productiveness and managing their land for a large yield of feed. It is too bad that a man like Mr. Wells and other visitors to the county credit them for this, and leave the county with what seems to be a scent of dirt from the dairies in their nostrils. Even if the article exaggerates conditions, it teaches a lesson that should be heeded. While California is building up a reputation as a dairy state

as regards a volume of business, let every dairy community see that a reputation for cleanliness accompanies it, as is the case of Denmark where so many of the Humboldt dairymen hail from.—Dairy Review.

GALLED SHOULDER.

In your paper of March 4th, I find a query in regard to galled shoulder on horse: The question was well answered, but may I add my experiences with galled shoulders for the benefit of all horsemen handling draft horses.

In the first place a great deal of this trouble arises from the team being put through eight or ten hours on the plow or harrow on a hot day until they are pretty thoroughly warmed up and blowing some, then left to stand and get their wind while the driver sits on the plow beam or fence and talks with his neighbor or companion in the field much longer than he realizes. My plan is never to drive my team until they need to rest ten or fifteen minutes, but give them one or two rounds according to the length of the land, then stop them with head to the wind and raise their collars so as to let the breeze strike them, at same time, rubbing the shoulder a little with my hand and brushing from the collar anything that may have collected upon it. Now this need take but one minute's time and even if done every fifteen or twenty minutes of the day, will take up far less time than the way above mentioned, and is all the rest the team will require. If teaming on wagon the team may be stopped and backed up so as to throw the collar away from the shoulders and an occasional airing will prevent galling. I have never failed to cure the worst cases in this way with the use of plenty of cold water at night, and alum water or oak bark tea as an astringent.

In conclusion, let me offer one more suggestion for the benefit of our most valuable helpers on the ranch, and that is that they be given a little water between meals. How many times a day do we stop at the pump or water jug and refresh ourselves with never a thought for the dumb beast that serves us a life time with no compensation but feed and water. I have one old brown mare in particular who never fails on a hot day to let me know when it is ten a.m., and three p.m., by stoping at nearest point to the house and calling for her drink as it is my custom to carry my team a pail of water at this time and divide it between them. Long live the horse, even the flying machine can't take his place.—C. S. C., Anaheim.

* * *

A humane suggestion, likewise a profitable suggestion for humane treatment with these faithful servants surely leads to greater profits.

AN EXPERIENCE WITH TURKESTAN.

I have been intending to write you my experience with Turkestan alfalfa and noting in a recent issue an article on Arabian alfalfa I wonder if it can be similar.

Two years ago I sowed 100 acres to alfalfa and being short of seed I purchased 100 pounds Turkestan, sowing about five acres through the center of field. The seed came up in fine shape and was a good stand, looked thrifty and rank, two light crops not much different from the common. The third crop and last of the season was not worth cutting, while next on both sides was the best cut of season. The next year the "Turkey buzzard grass," as my family dubbed it, did not start to grow for two weeks, but when warm weather set in it caught up and was a heavier crop than the other. I then thought it was well established and would be a better producer, and of equally as fine quality, but when the weather became a little cooler it did not grow and the last two cuttings of the common while being as good as the former, the Turkestan was not worth cutting, and now this spring it is slow to start, being about six to eight inches shorter than the common right to a line one-half mile on each side. I can not account for it except it is the breed of the animal and has been accustomed to longer and warmer seasons.

If the Arabian is any kith or kin to Turkestan I would go slow in this climate at least.—E. L. Ranney, San Jacinto.

* * *

The above from Mr. Ranney is interesting and we wish more from him. That is, how about quality of the hay. Coburn says: "An advantage which Turkestan has is that the stems are more slender and less woody, the plants making a more nutritious hay of finer quality. That it will withstand drought under same conditions better than ordinary alfalfa." However later in the book the author thinks nothing yet equals the common, well tried variety.

The Turkestan and the Arabian are however distinct varieties. The Arabian is worth a thorough trial. We trust practical growers will keep our readers posted as to its behavior in various sections of the state.

WORLD'S RECORD BUTTER COW.

The milk of the Holstein cow bearing the name above given was tested for butter by a representative of the Cornell University Experiment Station, Ithaca, N. Y., during the latter part of March, 1909, and by the Babcock test showed a yield in 7 days of 28.44 lbs. of butter fat. As such records are commonly stated by the Herd-Book Association this yield of butter fat is equivalent to 35.55 lbs.

World's Champion Cow, 35.55 lbs. Butter in 7 days
Grace Fayne 2nd's Homestead, Pure Bred Holstein

commercial butter at 80 per cent fat.

This yield exceeds that of any other cow tested under the present scientific systems in use at experiment stations, which are today the only true tests, and is a wonderful example of the capacity and development of cows of this famous breed of dairy cattle. The previous high record was held by a Holstein cow owned by a Wisconsin breeder, and New York state now claims the champion cow of the world.

This cow exhibits to a great degree the characteristic vigor of the Holstein. Her last test was begun when she was 6 years, 23 days old, and showed 5.42 per cent fat.

Arlington Heights, Riverside county, has a new and progressive farmer's club.

Contents

GOOD ROADS ATTRACT GOOD PEOPLE, Cover.
LIFE HISTORY AND CONTROL OF RED SCALE, 500.
CITRUS.—Tests Made on Fertilizers; Duty on Lemons, 500, 501.
DECIDUOUS.—New Fruits of Value; Shade Crops, 502, 503.
ORNAMENTAL GARDEN.—Introductions From Australasia; Easter Lily; Foliage, Not Flowers, 504.
SMALL FRUITS AND VEGETABLES.—Chayote; Green Corn, 505.
LIVE STOCK AND DAIRY.—Garget; The Hog of Today; Outside View of Humboldt County; Galled Shoulders; Experience with Turkestan, 507, 508, 509.
EDITORIAL.—Value of Co-operation; Count the Cost; Next Week; Plant Eucalyptus; Agricultural Education; Gamblers in Food Stuffs; Florida Growers; Wheat Conditions; Geo. T. Angell; Removal of Quarantine, 510.
AGRICULTURAL NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, the Coast, 511.
POULTRY.—Practical Experience with Leverets; Mineral Matter for Hens; Roup; Poultry Notes; Limberneck; Poultry Queries; Alkali Soils, 512, 513, 514, 515.
IRRIGATION.—Deeper Significance of Living; Ground Waters in the Indio Region, 516.
QUERIES.—Ground Squirrel Pest; American Grapes; White Scale; Not of Milk Strain; Turkeystan Alfalfa; Barren Strawberries; Grafting Grapevine; Canning Cherries; Beets for Cow; Grapes for Imperial Valley; Peach Leaf Curl; Feeding Milk to Calf; Abortion, 518, 519, 520.
LEGAL QUERIES.—Establishing Corner Stakes; Diverting Storm Water; Planting Near Line; Law of Inheritance, 520.
GENERAL AGRICULTURE.—Use of Disk Harrow; Banking Principles in Farming; Improving Alfalfa, 521, 522.
BEES.—Extraction of Beeswax, 523.
HOUSEHOLD.—Out of the West; In the Dark; Cream Chicken; Stewed Celery; Celery Stuffing; Celery Sauce; What can be Done With Salt; Home Hints; To Cure Nervous Headache; A Sewing Corner; Worry; Coal Oil Stains, 524, 525.
PRODUCE MARKET.—Los Angeles, Markets; San Francisco Markets; Citrus Markets, 526, 527.

VALUE OF CO-OPERATION.

Farmers of Eastern Oregon who are members of the Farmer's Union, now control the wheat output of more than forty million bushels. This association has filed complaint with the Interstate Commerce Commission alleging that freight charges to tidewater on the Pacific are exhorbitant. What may be accomplished through this complaint to the commission remains to be seen, but already a measure of success has been secured by these farmers in storing and shipping their grain direct, thus eliminating some middlemen's profits, which have been taken from them in the past.

It is to be hoped that the Union will continue to make good. We will not say that the only salvation of the farmer is in that organization, but we do believe that the greatest measure of success can only be secured through co-operative effort. When the farmer gets a complete enough realization of that fact, and will set aside his personal prejudices and join his neighbors in this great movement, then only can he overcome the advantage which the middleman has possessed over him in the past.

The next meeting of the Counties Committee of the California Promotion Committee will be held in Monterey, Saturday, May 8th. This will, to a certain extent, be a continuation of the topics discussed at the last Los Angelus meeting last fall. At that meeting publicity for California and for its products was discussed. Committees then appointed will be expected to report.

COUNT THE COST.

Too many farmers engage in the industry without proper counting of the cost of equipment and improvements of the land. Work is started with as much land as the farmer can command and the fact is soon made manifest that capital is not in hand to handle the crop to best advantage. Such farmers might well reduce the acreage, give more intensive cultivation to the land remaining and place all under the best of tillage. We have often heard prospective land buyers refer to dry land under which a vein of water was known to exist and the remark has been made "all that is necessary is to dig a good well and I will be absolutely independent of any water company." This is true and if a good vein of water is struck at not too great a depth the condition is ideal, but has the prospective land owner considered the cost of such an improvement? A good well with plenty of power costs several hundred, or possibly if a large quantity of water is wanted, several thousand dollars.

It is unwise to tempt failure by starting in on too great a quantity of land which can not be tilled in a successful manner.

NEXT WEEK.

We have in hand an article which will appear on first page of next week's Cultivator which will be of exceptional value. It is written by practical men from various sections of the state and will give their experience in their own words.

The Cultivator has had many commendations for its article on "Methods of Plowing Orchards," which appeared in the issue of March 18th and which was made up in a similar way, that is, personal experiences of practical men. This has encouraged us to further effort, along the line of irrigation.

We already have letters from San Diego county and other counties as far north as Butte. This article will be worth a year's subscription to the Cultivator, and even more, to many of our subscribers.

In the same issue will be tables for measuring water, with illustrations. These have been given before, but are to be repeatd by request of several subscribers.

PLANT EUCALYPTUS.

Plant eucalyptus but do it wisely. There is being too much wild-catting done this year, or at least it appears so to one looking on from the outside. The farmer who has waste land, or hillside land, or what is not readily tillable, should at all times see that it is planted to some rapidly growing valuable timber tree, or at least that which will make good fuel. Where conditions are right the blue gum has proven to be almost a perfect tree and should be planted, but companies which are organizing and offering great profits from planting more or less valuable land which is capable of producing more valuable crops where it is possible to supply with irrigation water, will not, we fear, be able to make good with the big dividends estimated. This movement is in the right direction, in the main, and we hope it will be educational and that every farm will soon have its small wood lot and that those who can well afford to experiment in a large way and with new varieties, will continue to do so.

AGRICULTURAL EDUCATION.

Oklahoma is taking the proper first step towards giving children of that state an agricultural education in the common schools. Many states have attempted it, but Oklahoma says to her prospective teachers "Show by your examination that you are qualified to teach things agricultural, then you may teach in our schools" or, at least, such will be the case after July first of the present year, when no one can get a certificate to teach in the common schools without passing a satisfactory agricultural examination.

There will probably be some pretty raw "agriculturists" for the first few years among Oklahoma teachers, but, ultimately, this step will lead to reasonally well qualified teachers who will be enabled to teach the "Young Idea."

FLORIDA GROWERS.

Three special cars with forty-five Florida orange growers arrived in Los Angeles Monday night, from which point they will inspect the orange groves and methods of marketing of citrus fruits by Californians. The party is made up of a fine looking bunch of men, a few accompanied by their wives. They were extended the courtesies of California by the Los Angeles Chamber of Commerce and the California Fruit Growers' Exchange. The Exchange is showing a very fraternal spirit and opening its books and giving every facility to the Florida people to get pointers on California methods of co-operative fruit marketing.

Trips have been taken to pre-cooling plants and to orange groves and packing houses and some of these points will be made the basis of an article in the Citrus department of next week's Cultivator.

We hope the fraternal spirit shown by the Californians will cement the friendship between these two great citrus producing sections.

Florida is more than welcome and we hope that her representatives will have an enjoyable and profitable visit to our state.

GAMBLERS IN FOOD STUFFS.

The corner which was attempted in the wheat market seems to have failed to have held good. The slump which has started wheat on the downward grade shows that the effort was apparently that of the gambler.

This country, as a whole, wishes to see the farmer get a living price for his produce and to that end we believe that even the consumer is willing to pay a reasonable price for bread, but this gambling in food stuffs has awakened the country to a fact, which has been to a certain extent realized for many years, that this gambling element should be suppressed and the forcing up or forcing down of wheat at the will of the bulls and bears is inimical to the best interests of the country and our law makers should take cognizance of that fact and correct the evil.

WHEAT CONDITIONS.

Outside of the gambling in wheat which has been conducted in Chicago during the last few weeks the legitimate price of wheat is shown to be such that plainly there is anticipation of shortage in the output of this year. But that this shortage is not sufficient to justify the price to which wheat has been forced is shown by the report of the Department of Agriculture. This report says: "The average condition of winter wheat on April 1 was 82.2 per cent. of a normal, against 91.3 on April 1, 1908, 89.9 on April 1, 1907, and 86.6 the average condition for the past ten years on April 1. The decline in condition from December 1, 1908 to April 1, 1909 was 3.1 points as compared with an average decline in the past ten years of 6.0 points."

GEORGE T. ANGELL.

One of the best known characters in this country was Geo. T. Angell, the editor of "Our Dumb Animals," who died recently in Boston. Mr. Angell has been regarded as one of the best friends of dumb animals which this country ever had. He has persistently and constantly fought for their protection and for their comfort. He was at the head of the Society for the Prevention of Cruelty to Animals and of 70,000 children in "Bands of Mercy." The work which he has started will doubtless live forever.

REMOVAL OF QUARANTINE.

The Secretary of Agriculture has issued an order, effective April 24, releasing entirely the quarantine for foot-and-mouth disease, as he is satisfied that the disease has been completely eradicated from the United States.

CHANGE OF ADDRESS.—In notifying this office of change of mailing address, please bear in mind that the old postoffice address must be given, as well as the new. Our records are such that it is almost impossible to find a name on our lists unless this information is given.

Agricultural Notes of the Pacific Coast

Northern California

Yolo County beet acreage is immense.

Santa Rosa's rose carnival will be held Saturday, May 8th.

The thrips is causing much damage to pear orchards near Suisun.

A full crop of all varieties of fruit is promised to Eldorado county.

Sutter County almond crop will fall short but all other fruits are looking fine.

Alfalfa cutting began at Woodland, Yolo County, about the middle of the month.

Newcastle and Loomis will ship much larger quantities of cherries than ever before.

Lakeport, in Lake county, will soon have a new industry in the form of a mushroom plant.

One fruit concern of Sonoma County has placed an order for six car loads of box shook.

The supervisors of Mendocino County have appointed a sheep inspector for each supervisorial district.

Ferndale reports haying as progressing rapidly. Some injury was done however by drying winds.

Alameda County orchardists report that the Scutellista is doing exceptionally good work on the black scale this year.

Yuba and Sutter County wool growers recently met at Marysville and made arrangements for the annual spring sale.

The fruit outlook for Nevada county has never looked so promising as this year. Many new orchards are being planted.

The Ukiah Times announces that many vegetables are shipped that section from San Francisco and appeals for "home made" vegetables.

Newcastle fruit growers are appealing for a co-operative market as a remedy for poor prices that have been secured for fruit of that section.

The Sacramento Valley Development Association is pulling the different communities together to work up one large fund to advertise the advantages of the valley.

The Gridley canery picnic promises to be the biggest ever, this year. The attendance last year being between 8000 and 9000. The date of the coming picnic is June 4th.

The Sacramento Valley Development Association is planning to receive the National Irrigation Committee from the U. S. Senate which will make a visit to that valley later in the season.

Berkeley milkmen have asked for an injunction against the State University to prevent its agricultural department from marketing its surplus milk to the residents of that city. The milkmen claim that the University is doing this at less than cost and for which the state tax payer pays.

The promise is that this will be an exceptionally good year for sheep men of the state. Present offers of buyers of wool are only about 13 to 16 cents while in the Eastern states 25 to 26 cents is the price, while in Montana 21 and 22 cents. The reports is, however, that the season is so exceptionally favorable that nearly all lambs are saved.

Central California

Hanford has adopted a pure milk ordinance.

Total rain fall at Salinas aggregates 18.49 inches.

Visalia is discussing the question of a sewer farm.

Hanford is to be given another rural delivery route.

New alfalfa hay is being freely offered in the market.

Tulare ships each month about $70,000 worth of butter.

Merced county recently organized its fourth Farmer's Union.

Egyptian corn planting is quite extensive in Stanislaus county.

A county Farmers Union was organized at Turlock last Saturday.

Arabian alfalfa at the Tulare substation is growing remarkably well.

Farmers about Hughson, Stanislaus county, are making first cuttings of alfalfa.

The Modesto creamery is now handling over two tons of cream daily.

Beets in the Corcoran field now measure about an inch and a half in diameter.

Some trees shipped to Santa Clara valley affected with root knot were condemned.

Visalia observed April 13 as annual clean-up day and Hanford observed the 15th.

Merced county is considering a proposition for bonding the county for $500,000 for good roads.

Thrips are reported by Entomologist Morris to be decreasing in sections where they first appeared.

Tulare has a clean-up day at which time roadsides are to be freed from weeds and unsightly tin cans.

Orchardists near Madera are vigorously fighting a small colony of scale which has recently been discovered.

Tulare claims the largest eucalyptus nursery in the world and that it will propagate about 5,000,000 trees this year.

Some Pajaro valley apples are selling in New York at satisfactory prices. One sale recently netted $1.70 per box.

The last few days have been busy ones in all the packing houses preparing the great output of raisins for Raisin Day.

S. W. Marshall, one of the pioneer nursery men of the state, died recently at his home in Fresno. The business will be continued by his son.

This is the busy season of the year with the peach borer moth. Soil should be removed from near the crown of the tree and the bark whitewashed.

Prof. E. B. Babcock and County Entomologist Earl Morris of Santa Clara county are investigating various fungus diseases affecting roots of fruit trees.

The Farmers Union membership of this state now aggregate nearly 5000 and its most hopeful friends predict that before the end of a year this will have increased to 60,000.

The Madera county supervisors have passed an ordinance which makes it unlawful for anyone to have in their possession citrus trees raised in Fresno or Tulare counties.

Southern California

Coachella valley will produce two hundred cars of Bermuda onions this year.

Cotton seed now being planted in Imperial valley is costing the growers $14.00 per ton.

Some Imperial hay shipped to Los Angeles market too soon after cutting heated in the bale.

Cucamonga, San Bernardino county, apricot growers have already been offered $20.00 per green ton.

Several thousand acres on the Hemet Tract are being set to citrus and deciduous trees this spring.

The Anaheim Walnut Grower's Association paid to its members last year $10.68 per hundred for soft shells.

Large attendance was given to the Demonstration Train in Orange, Los Angeles and Ventura counties, last week.

The Santa Fe has added a gasoline motor, which it is thought is the forerunner of a large number of them to be used in the suburban traffic.

It is now thought that melon shipments from the Imperial Valley will not begin before the 2nd or 3rd of June. The output will probably not exceed 1200 cars.

Water is running over the Great Hemet dam for the third time in the last three years. This will insure sufficient water supply for the Hemet tract for several years.

Representatives of a large sugar company have been looking over the section around Perris, Riverside county, to determine as to the advisability of locating a sugar factory there.

The membership of the Imperial County Dairymen's Association is increasing. The dairy interests of the valley are now receiving more than $1,000 per day for the output of the milch cow.

Southern California has been much concerned by the report that potash, largely used as fertilizers in the orange groves, was to be heavily taxed in the Payne bill. Latter reports show it on the free list.

The large shipments of oranges during the last two or three weeks have put the total shipment ahead of any preceeding year at this date. A few weeks ago, the shipments were more than 1,000 cars behind the shipments of last year.

The Colorado river is receding from its first flood, but the big flood which will test the Laguna dam and the levees at the Imperial intake will come probably about the first of June. It is anticipated that the flood will be higher than usual this year.

A rancher at Artesia had a peculiar experience recently by being nearly drowned in skim milk. He was walking along by a large tank, in which milk is run after separating, and accidentally slipped in. Not being a swimmer, he was nearly dead when rescued.

At the recent annual meeting of the Fullerton-Placentia Walnut Association an excellent noon luncheon was served by the ladies and a full day given over to business. The association sold last year almost a million pounds of nuts. The net price to growers was about 10½ cents.

The Coast

Timothy hay is selling in Portland. Oregon, at $14 to $16.

The "Jim Hill" mustard is proving troublesome again this year.

One grower at Camas, Wash., is planting 90 acres of English walnut trees.

Tobacco raisers at Bingen, Wash., are raising exceptionally fine cigar tobacco.

The prospect is good for a bumper crop of wheat in the Palaouse, Washington, country.

Despatches from Asotin, Wash., state that the fruit crop for Clarkson Valley is most promising.

The annual horse show recently held at Colfax, Wash., was poorly attended owing to inclement weather.

A great increase in the acreage of apples and walnuts at Sheridan, Wyo., is the result of last seasons plantings.

Sheep men of the Yakima valley, Washington, are endeavoring to interest capital in a wool scouring plant.

Walla Walla, Wash., has preserved and pickled two tons of fruit and vegetables to be exhibited at the A-Y-P Exposition.

The electric lines in Washington are as up-to-date as the steam railways and are now conducting farmer's institute trains.

Poultry men at Belingham, Wash., are rebelling at high prices on wheat, and other feed and some are going out of the business.

An irrigation company having lands near Salem, Oregon, will subdivide and place on the market eight thousand acres of fine land.

Portland, Oregon, is making an appeal for greater number of cattle and hogs to keep the packing houses of that city wholly occupied.

A new irrigation district near Morrison, Wash., has found a strong vein of water at 75 feet depth which covers a vast range of the country.

Spokane is preparing for the great Irrigation Congress. It is expected there will be 40,000 visitors in the city at the time of the meeting.

Wool buyers at Rocksprings, Wyoming are endeavoring to make contracts at 21 cents. Most of the growers are holding for a higher price.

The largest wool sale made in Washington this year was made by a Umatilla county grower who disposed of 150,000 pounds at a price supposed to be 18 cents.

The 32nd annual session of the Oregon State Grange Patrons of Husbandry will be held at Linden, Oregon, Tuesday May 11. It will be a four days' session.

Hop shipments from Oregon during the month of March were 5,163 bales, or a little more than one-third the amount of the same month in the preceding year.

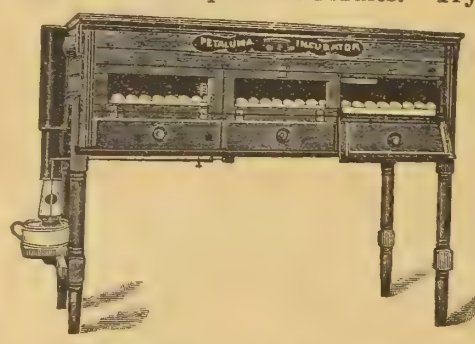
The attorney general of Oregon has passed recently on the dairy law and it has been pronounced constitutional and the commissioners will soon name inspectors.

The work of the Reclamation Bureau on the Yuma Irrigation dam has caused a rise of water on the Gila river in Arizona so that the levees have to be strengthened.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. You ***can't*** afford to try and be successful and not get results. ***Midland Poultry Food*** will produce results. Try it and see. $1.95 per sack



Petaluma Incubators and Brooders

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Petaluma Incubator Company

Petaluma, California

Our General Agents for Incubators and Brooders and Midland Poultry Food:

Petaluma Incubator Co., Petaluma, Cal.
Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles
Berrar & Robertson, San Jose, Cal.

When the chicks are hatched don't feed them anything for 24 hours, then feed them the best dry Chick Feed you can get. We say that is

West Coast Chick Feed

SAMUEL R. KELLAM, former president of the L. A. Co. Poultry Association, says: "West Coast Chick Feed is the best feed for young chicks I have ever used. I have given this feed a thorough test, and have always found that it produced fine, large, healthy chicks."

MRS. A. BASLEY, the celebrated poultry authority, says. "I want some more of your West Coast Chick Feed, for it is excellent. It is purer, cleaner and appears better balanced than other feed I had been using, and to tell the truth, I have been experimenting, feeding both together, and they always eat yours in preference."

Ask your neighbors, for there is more of "West Coast" sold in Southern California than all other kinds put together. If not sold by your dealer send us $3.50 and we will send a 100 lb. sack, freight prepaid within 300 miles.

West Coast Mill

705-709 So. Griffin Avenue, Los Angeles, Cal.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

PRACTICAL EXPERIENCE WITH LEVERETS.

FOLLOW that good old English recipe and "First catch your hare." The day of fancy hare-breeding has about gone by, but common pride prompts one to desire good stock.

We started in with two well-bred does which had been bred to males not allied to the does or to each other. Then later purchased a fine buck. In this way it was possible to make many matings without inbreeding which is, or is not, very bad indeed, according to personal opinion. So far as my belief goes inbreeding seems to tend toward lowered vitality. The does are known to be in mating condition when they pound heavily on the hutch floor with the hind feet; their kicks sounding almost like the blows of a hammer. Never leave a doe in the pen with the buck more than a few minutes. The period of gestation is thirty days and there is rarely any variation. About a week after breeding supply the doe with a nest box about 15 inches square and about a foot deep. This is best made with a removable top to be buttoned or hooked in place, and an opening in one side near the bottom, of sufficient size to allow the doe to go in and out freely. The box should be set with this opening toward the solid wall—and not too far away. The object being to keep the interior dark as possible.

Put some straw or litter in hatch and allow the doe to make her own nest. We have had does begin making a nest the very day they were bred; and one fine doe in particular never began her nest until a couple of hours before it was needed.

Provide the expectant mother with plenty of clean cool water and let her alone. A day or two after kindling open the top of the box and examine the young, removing any dead, or if any are deformed they had best be killed at once. The babies are not larger than ones thumb, gray-black, naked, blind with only rudimentary ears and about as easy to handle as small live fish. A three inch baseboard must be fitted around the bottom of the hutch as when the babies leave the nest they can easily pass through wire with one inch mesh. Feed the mother generously and don't disturb her. You may never see her nurse her young. We never owned but one doe which was ever seen to nurse her family, but if fairly treated they are almost always good mothers. Feed the little folks rolled oats or bread and milk or dry bread for main diet with a daily relish of green food, always keeping watch of the droppings and regulate the bowels by proper feeding; any loseness being promptly checked with dry food,—dry toasted bread scraps, etc., and constipation by increasing the green food. The does have been known to kindle again when the previous litter was only 33 days old, but a far better plan is to have not over three litters a year allowing the mother to care for her young until two months old. It is well to provide a shelf, unless the top of the nest box is available, in order that the mother may get out of reach of the youngsters as they annoy her exceedingly. Infant mortality is very light when proper care is exercised in feeding, watering and sanitation.

When the leverets are taken from the mother the sexes should be separated although the young does may be kept together until bred, and the young bucks until used for breeding purposes, after which each should have a separate pen.—Bee Josephine O'Mealey, Anderson.

MINERAL MATTER FOR HENS.

Chickens consume a great deal more mineral matter than is commonly supposed. Not only is there mineral matter in the general body composition, but large amounts in the bony framework and a considerable amount in the feathers. The growing chick, probably more than any other animal, needs an abundance of mineral matter to meet its growing demands.

It is a well known fact that chickens go about picking up every small bit of mineral substance that they can find. This is surely an indication that these things are of a benefit to them. Also, it has long been held that grit in the form of small pebbles and other hard substances are used exclusively for grinding food. Of late, after more careful study of digestion processes with poultry, authorities have come to the conclusion that grit does not aid materially in the grinding of food in the gizzard. It is very likely that the pebbles grinding together there are reduced to a powder and are utilized in the animal system as a mineral food, the slow reduction making digestion possible.

Different animal and vegetable foods contain different proportions of mineral matter, some containing a large and some a small amount. Of the grains, for instance, wheat contains more mineral matter than corn. Animal bony matter contains more mineral matter than animal flesh. Also, some common natural mineral substances contain a greater number of mineral elements that can be utilized for food than others. Some granites contain more inorganic elements than limestone. Oyster shells, the popular mineral chicken feed, contains practically nothing but lime, yet it is an excellent mineral poultry food.

No one food contains all the necessary mineral elements to supply the demands of the growing chick or the laying hen. A variety is necessary. Nearly everyone has noticed how a flock of chickens, especially in the spring and during the heavy laying season, will scratch and work in a pile of sand, gravel, or ashes of any kind. This ought to be a clear indication that they were finding something to satisfy their natural physical desires. Chickens will readily eat large amounts of coal ashes and cinders and it is a good thing to furnish them a supply at all times. A wagon load of small gravel should be in every poultry yard, and if the gravel

contains bits of broken river shells, so much the better.

Mineral in well balanced proportions, can be supplied to poultry in the form of cut, ground or pounded bone. Green bone supplies both animal and mineral matter. Old bones contain some animal matter, while burned bone contains only mineral matter.

Of all vegetable foods, clover, especially the leaves contain the most mineral matter. Clover is also rich in protein egg and flesh-forming substances. Chickens will eat clover either in a green or a dry state. A patch of clover near the poultry yard will supply them with food during the summer and clover heads and leaves raked from the barn floor will readily be consumed by them in winter.

Those who expect to make their young chickens grow vigorously and their hens lay well must never forget that they require an abundance of mineral foods and supply them with all they need. It is cheaper than any other foods, but just as essential.—Journal of Agriculture.

TREATMENT FOR ROUP.

A mattery substance forms in the corner of the eye, and perhaps the eyes will close sometimes. There is an offensive odor from the nostrils. The chicks become very light in weight, act stupid and eat little. They do not lay at all. The disease runs through young and old hens alike.

These symptoms point to roup, or diphtheria, as we know it among persons. It is a highly contagious disease and one to be dreaded. Exposure to cold, drafts, damp houses and unclean quarters are at the bottom of different cases. If the birds get run down in vitality from any reason, the disease is induced. Foul water may bring it on. Where the trouble is severe the bird rarely recovers.

On the first sign of this disease the bird should be removed from the house and the quarters disinfected by burning sulphur and carbolic acid for two hours when the fowls are out. Also drop turpentine and carbolic acid over lime until slaked, then scatter this about the houses. A good remedy is as follows: Tincture of aconite, ten drops; tincture of spongia, ten drops; add alcohol to make one ounce. Put one teaspoonful of this in a quart of drinking water daily. Kerosene is good. Plunge the head of the fowl in the liquid, withdraw quickly, and wipe dry with a soft cloth. The eyes may be treated by washing with warm water twice a day and anointing with vaseline. If the bird does not quickly respond to treatment, put it out of the way and bury it. Never let a hen with roup drink where the others do.

POULTRY NOTES.

Take care that the pullets do not get fat, for they will not lay well if they do.

Give the hens something to scratch in, for the scratching hen is the one that lays.

While a variety of food is essential to laying hens, yet plenty of non-fattening foods is more essential.

Feed green cut bone and meat scraps mixed in the hens' mash, then the bosses will not get more than their share.

Poor beans boiled soft, with a piece of fat meat put in for seasoning, makes good food for hens. They may be fed clear, or mixed with their mash.

CAUSE OF LIMBERNECK.

Limberneck with chickens is caused by the birds eating decaying flesh or filth containing maggots. The maggots lodge in the throat of the bird, causing paralysis of the muscles of the neck and consequently inability to swallow food. When affected, the chicken remains inactive in one place for days at a time without control of its neck or head. Since there is no longer power to take food or drink, it gradually dies of starvation and, perhaps, slow poisoning. Very few that become afflicted ever recover.

Not much can be done with a chicken suffering with limberneck. Soft bread soaked with turpentine or kerosene is said to be effective in removing the cause, if the case is taken in time.

Good laying breeds are too numerous for us to suggest one; the buyer should use his own discretion, only being sure the particular breed will thrive under the conditions of his selection.

POULTRY QUERIES.

Balanced Rations.

Would be pleased to get a formula through the columns of your poultry page for making a balanced ration for poultry in one thousand pound lots.

I am just starting in the business and I have my own power and grinder for grain and bone, and am in a position where I can get all grain, etc., at merchants discount.—L. M. S.

Here is the foundation for a great success. In the first place, the green cut bone should be made a goodly part of the daily ration, if the bones can be obtained perfectly free from taint, and cut and fed at once. This was our way when we had a bone cutter, and we could then see that every particle was beyond reproach. Those parts which were slightly old, but not absolutely bad were cooked in a large kettle outside, and stiffened with bran, and made a food the hens were especially fond of, always seasoned with salt, and sometimes with a little pepper.

As a rule, cooked food is not best for fowls, but this soup and bran food occasionally gives them a much relished change.

The balanced ration must contain one part of protein to four parts of carbo hydrates, and there are many ways of mixing foods to obtain these results. The "balanced ration" of commerce consists of two parts bran to one part each of cornmeal, alfalfa, and beef scraps, measured, not weighed, so as the bran is about twice as bulky as the other ingredients one would be safe enough in using 200 pounds of each to make one thousands pounds, and this food may be kept before the hens at all times.

To grind one's own feed, as our correspondent wishes to do, one must study the composition of the various available grains, mix a ration and try it, and add other combinations as indicated.

Peas and beans contain the necessary protein and may be substituted for the beef scrap safely, especially if green bone is fed, and as wheat at present prices is out of the question, almost, one may substitute oats and barley. Therefore for 1000 pounds try this:

Beans or peas, 200 pounds; oats, 300 pounds; corn, 200 pounds; and barley, 300 pounds. After grinding, mix in salt, 5 pounds and black pepper 5 pounds. Feed this mash dry or moist, but for regular diet the dry mash will be found best.

Our correspondent does not say

"Success" Fireless Brooders

50 Chick $2.50
150 Chick $5.00

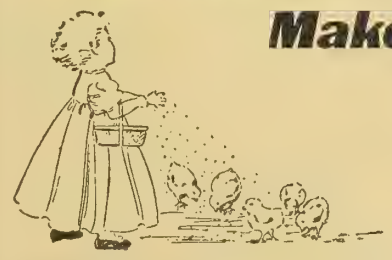
Coulson's POULTRY FOODS

Special Dry Chick Food

Makes Them Grow



Throw it out in the Litter and Make them Work

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequaled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the present high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed, to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE-SAVER. Write us for free samples and prices.

what end of the chicken business he wishes to tackle, so we presume it is grown stock and an egg ration and that is desired so this is what this food is intended for.

For fattening fowls this ration mixed with milk, fed three times a day will be found excellent. The last week of the fattening process (which should not take over two weeks) may contain a larger per cent of cornmeal, say one-half as much cornmeal as mixture. This, added to the cornmeal already in the mash, gives enough.

—Mrs. F. M.

ALKALI SOILS.

There are generally two kinds of alkali—white alkali and black alkali. White alkali is sometimes composed of sodium sulphate, ordinarily known as Glauber's salts, and sometimes of magnesium sulphate, ordinarily known as epsom salts. In other places both sodium sulphate and magnesium sulphate are found together and occasionally they are mixed with common salt.

Black alkali is composed of sodium carbonate, commonly known as salsoda. It derives its name, black alkali, from the fact that it is a solvent of humus, decayed organic matter in the soil, as a result of which it forms a very black stocky substance.

Land is not generally affected with alkali, but alkaline salts are found only in spots. Under such conditions it is possible to remove the alkali by a thorough system of tile drainage. These alkaline salts are all soluble in water, hence if the water accumulating in low spots can be removed from the soil through drains rather than through evaporation, the alkali will finally all be carried away. When natural drainage is not sufficient to carry away the surface water from the low places, and it must be removed by evaporation, it is evident that there will be an accumulation rather than a decrease of alkali in such spots.

It is estimated that one-tenth of one per cent of black alkali in the first foot of a loam soil renders it unproductive, but that it takes from four-tenths to five-tenths per cent of white alkali to seriously interfere with crop production. Of all cereals rye is least affected by alkali; following this crop the susceptibility to alkali of wheat, barley, oats is in the order given.

Alfalfa is not very much affected with either black or white alkali. Especially is this true if a thorough seed bed is provided and conditions for germination are favorable. After the land is once covered with alfalfa there is no other crop in this section that can be grown to better advantage on slightly alkali soils. This is partly due to the fact that it covers the ground throughout the entire growing season, thus preventing evaporation of moisture. It should be understood that as moisture is drawn up from below alkali is brought up with it, and as the water evaporates the alkali is left on the surface.

Is there any way to destroy this alkali in the soil? This depends upon its nature. If it is black alkali—sodium carbonate—and does not occur in the land in too large quantities, it may be destroyed by the application of gypsum. Gypsum is calcium sulphate and when this chemical is added to sodium carbonate or black alkali, calcium carbonate, ordinary limestone, and sodium sulphate, white alkali, are formed.

If, therefore, the black alkali does not exist in too large quantities, the white alkali, formed by the addition of gypsum, may render the soil harmless to growing crops. Alkali soils are also benefited by a liberal dressing of barnyard manure or by the plowing under of green crops. Sweet clover, vetches, etc., have been quite largely utilized in some localities for plowing under as a green crop. They will grow on very strongly alkaline soils better than almost any forage crop and produce a large amount of organic matter which, when plowed under, ferments, producing a considerable amount of acid, which in turn neutralizes the alkali.

It is estimated that it costs the farmer more to haul a bushel of grain than it does a railroad to haul a ton of it.

POULTRY NOTES.

A hen, without exercise, cannot be profitable.

Lice and mites must be fought with eternal vigilance.

It is difficult to maintain Bantams at the smallest size.

Filth is the root of nearly all evil in the poultry business.

Breeding fancy pigeons would be interesting to the boys.

A hen that is laying requires more food than one that is not.

Don't allow the coops, etc., to become damp and foul-smelling.

Success depends more on the care given to fowls than the breed.

Pioneer ROOFING

Of all ready Roofings, Pioneer "Rubber Sanded"—and Pioneer "Rubber Flaxine"—are best.

When writing advertisers, mention Cultivator.

If you have a dog that sucks eggs, get rid of the dog and not the poultry.

When the hens get sick and you don't know the trouble, look for lice.

The majority of failures are made through carelessness or thoughtlessness.

The nests should be renewed often and the roosts washed with some insecticide.

If the poultry business is carried on to any large extent the incubator is a necessity.

Lime scattered around in damp, filthy places will disinfect them and absorb odors.

Clean out the henhouse at least once a week. The droppings are good for fertilizer.

A careless person cannot get best results from poultry; they require regular attention.

To purchase eggs is the least expensive way to get a start of fine poultry, but it takes longer.

A WOMAN'S IDEA OF SUMMER COMFORT.

To every woman, especially the woman who keeps house, the topic of summer comfort in the home is one of never-failing interest.

This is particularly true where comfort in the kitchen is concerned, as it is in this one room that the most trying part of the work is done, such as cooking, baking, ironing, and heating water for wash-day purposes. Even in cool weather such work is not altogether welcome, but it becomes drudgery on days when the mercury is trying to jump through the top of the thermometer, aided by a hot stove that diffuses its almost unbearable heat through the kitchen.

But such days are past. With the New Perfection Wick Blue Flame Oil Cook Stove, kitchen drudgery becomes kitchen comfort, for this wonderful stove is so constructed that it not only produces quick results, but does it all without perceptibly raising the kitchen temperature.

All this means real comfort to the woman who works in the kitchen, especially when considered with the added advantages in the saving of time; in the doing away with all carrying of coal, wood and ashes; in having a stove that can be turned on or off, high or low, as required; and in not having to keep it lighted when not in use.

Then there is the saving of fuel to be considered; and it is here also that the New Perfection excels. Although equipped with three burners it has but one oil reservoir, thus reducing three separate filling operations to one.

Besides all this, the "New Perfection" is the only oil stove built with a cabinet top. Its commodious top shelf is particularly useful for warming plates and keeping food hot after it is cooked. In addition there are two drop shelves on which may be set the teapot or coffee pot and small cooking utensils. Also has two racks for holding towels.

Altogether the "New Perfection" is a stove of wonderful utility. Its extremely handsome appearance sets off any kitchen to full advantage. It is superior to the hot coal range no matter what the point of comparison may be—or whether regarded as a summer stove only or as a stove for year 'round use.

Another household article of unusual convenience is the Rayo Lamp, a scientifically constructed lamp that will adorn any room—whether library, parlor, dining-room or bedroom. The Rayo Lamp gives a mellow steady light that does not tire the eyes. Its center draft burner of the latest design and its fine porcelain shade make it a lamp of combined usefulness and beauty.

The New Perfection Wick Blue Flame Oil Cook Stove and the Rayo Lamp constitute two household articles that will meet any woman's idea of home comfort. In the thousands of homes in which they are already used they are making things cheerful because of their absolute safety, great simplicity, and wonderful convenience.

Irrigation and Forestry

THE DEEPER SIGNIFICANCE OF LIVING.

IT WAS Zoroaster, some 4,000 years ago, who said: "Reflection is the path to life, thoughtlessness, to death," and it is as true now as it was then, as true of nations as of men. Thoughtlessness is heedlessness and heedlessness is blundering and blundering brings disaster and disaster terminates in death with half a life lived and little joy had.

France is the banking nation of the world, and it has come to be so through the saving habits of the French people. The Frenchman puts by something every day, week, month, year of his life, saves some little out of his earnings; a wise monetary system makes these littles available for enterprise, and so France can lend the rest of the world something like a billion dollars a year. The French people have found thoughtfulness the path to life, for the French live well. They are the best cooks in the world. They set the fashion for dress. They cultivate art and the drama. Their language is the language of diplomacy and polite society the world over, their architecture is repeated in many lands and their love for France is not excelled by that of "the hill men for their hills." The French have found reflection the path to a very enjoyable life.

The greatest benefit conferred by President Roosevelt upon the country he has so ably served for seven years has been his calling attention to the need of conserving our national resources. We of America have thrown away each year more than the French nation has saved. We have not reflected upon the ultimate consequences of our industrial policies. We have been heedless and blundering and have suffered disaster of our own producing and, unless we mend our ways, those who come after us will perish as miserably as the miserable perish in India because India also did not reflect, but denuded its hills, submerged its valleys and starved its people. That way lies national death. If one doubts this let him ask of the buried Pharaohs, of Ninevah and Babylon, of the valleys of the Nile and Euphrates, of the bones of starved millions that whitened the Mesopotamian plain.

But conservation of resources is not merely a national problem. It is an individual problem as well. A spendthrift people will make a spendthrift nation and a nation cannot be made conservative of its resources unless the people who go to make up that nation are conservative of their resources. The policy of conservation, to be effective for good, must begin at the cradle and end only at the grave. This and meagre lives mean living full and well rounded lives with an anchor always to windward to hold fast to in the event of a storm. A great proportion of the population of England is within ninety days of being dependent upon charity. It is not so with France and yet the Britisher is conservative compared with the American.

The greatness of America depends upon the conservation of the resources of this continent, but the greatness of Americans depends upon the conservation of the energies and substance of the individual man, woman and child. Except the idea of conservation takes such hold upon the imagination and enthusiasms of individual Americans as the idea of saving takes hold of the mind of the Frenchman, or cleanliness of the minds of the people of Holland, the fate of India, of China, Egypt and Assyria awaits the America of not three centuries hence. The press of population against the power of subsistence will pinch hard in this country within the lives of babies born in 1909. Is it no concern of ours what befalls 1909 babies? Is it not the supreme concern? They are our babies or our children's, in which case we love them the more. To the manager of a corporation, bent on paying big dividends, this is sentimentalism. So be it. No truth has value until transformed into sentiment.—California Weekly.

Barley Field at Heber. Courtesy Calexico Chronicle.

GROUND WATERS IN THE INDIO REGION.

The Colorado Desert, in Southern California, is one of the most interesting and one of the most nearly rainless parts of the United States. It lies in a wide valley, the northwest extension of the great depression at whose south end is the Gulf of California. Before the overflow of Colorado River into the Salton Sea, which began about five years ago, this basin was, with the exception of Death Valley, the lowest dry land in the United States. It is also the hottest place in the country, according to the official records.

Features of the Desert.

Parts of the desert are wastes of shifting sand, kept in almost constant motion by strong winds. Other parts, on the borders of the Salton Sea, contain strongly alkaline areas, and in some places now covered by that sea large quantities of salt have been mined. South of the Salton Sea, in the Imperial Valley, the soil consists of fine silt, deposited in past centuries from the overflowing waters of Colorado River. This part of the area is the scene of the spectacular and almost uncontrollable overflow which was the occasion of a special message from the President to Congress and which was closed after repeated failures only in 1907, by the Southern Pacific Company.

Irrigation in the Coachella Valley.

Toward the north end of the valley in which this desert lies, for the most part below sea level, is the Indio region, or the Coachella Valley, where underground waters have been utilized for irrigating several thousand acres of fertile land. Melons, barley, and alfalfa are extensively grown on large areas, and smaller tracts have been planted in oranges, grapes, sweet potatoes, and sugar beets. Date palms have been planted also, and on the agricultural experiment farm at Mecca rare varieties of luscious dates, which heretofore have been produced only in the Arabian deserts and in the oases of northern Africa, are grown successfully.

A report on the Indio region, including a sketch of the Colorado Desert, prepared by W. C. Mendenhall, has just been published by the United States Geological Survey as Water-Supply Paper 225, which may be had free on application.

The report includes a description of the geography and geology of the Colorado Desert and an account of the undeground waters of the Indio region, and is illustrated by maps, sections and reproductions of photographs of interesting features of the country.

Portland, Oregon, quotes butter at this writing at 29 cents.

For Your Pocketbook's Sake---Read This

I am so confident that the Olds Engine is the most economical and most durable engine you can buy that I will make this proposition to every buyer of an Olds Engine.

I agree to replace, free of charge, any part of an Olds Engine that breaks or becomes worn, from any cause whatsoever, within one year from date of shipment, provided the replacement is one you think should be borne by the manufacturer. You are to be the only judge. There is to be no argument, no delay in returning old parts and getting new ones; you decide and I abide by your decision.

J. B. SEAGER, Gen'l Mgr.

Do you think this proposition could be made on any engine but a practically perfect one? You can easily see that to stand this supreme test of durability and perfect workmanship it must be built right, of the very best material, of the simplest construction. This is the kind of an engine you want. You take no chances in buying an Olds. All of my representatives can furnish these repairs without any delay. They do not have to consult me. Write to my nearest agent. He can fix you out with the best engine you can buy, no matter what others cost.

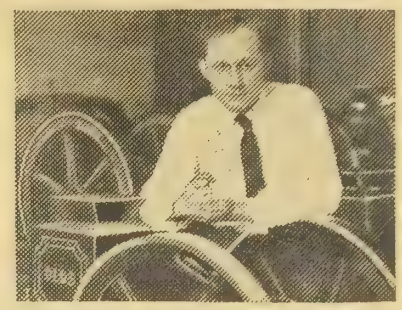
OLDS ENGINES

Give you the power you need at the price you can afford to pay for it.

They are the cheapest engines you can buy—simple in construction, most economical to run, do not get out of order, easy to start winter or summer—a ten-year-old boy can run the Olds Engine just as well as a man.

Thousands of farmers have found out the superiority of the Olds over all other engines. The United States Government must have found it out also because they buy Olds Engines for their military institutions, forestry and irrigation departments. Uncle Sam thoroughly investigates everything he buys. The Olds Engines stood the government test just as they will stand every other test.

For thirty years we have made nothing but Olds Engines. We know the Engine business just as you know your sitting room. Our business has steadily increased during that time. What made it? Why, because the Olds Engine did just what we claimed for it—every user was satisfied and knew he had got more than his money's worth, and he told some one else about it



F. B. Close, Mgr. Los Angeles Branch

YOU cannot afford to do without an Olds Engine. The first cost is saved so quickly in time, labor and money that no shrewd farmer should try to get along without one. The daily cost of an Olds Engine is so small it is hardly worth while counting, compared with the work it does.

There are not two farmers out of a thousand who could not use an Olds Engine with profit to themselves on their farms. You know what can be done with an engine on a farm better than I. You know an engine is needed on every good farm, but probably the reason you have not one now is because you have felt you could not afford it, or had some idea an engine was a difficult thing to run, and an expensive thing to keep in order, or perhaps you have had an engine that did not give you satisfaction. Not so with an Olds. You can afford it. Thousands and thousands of successful farmers have felt just as you do, but each man owns an Olds Engine today, and now he wonders how he ever got along without it.

Do you think the big successful men of this country would be where they are today if they had not kept up with the times? They bought the things they needed to increase their earning power. A successful man can always find a way to pay for a necessity in his business.

I guarantee every Olds Engine that leaves the factory to be in perfect running order. I do not spend much time in the office. I am out in the shop with my coat off watching every detail.

By keeping right out among the workmen, seeing that all the little things are actually done, I know the engine you get is all right, and that the high Olds standard is maintained. I also know the engine is "Best by every test," because I look after the testing and inspecting myself. They are the best you can buy, whether you pay less or more than the Olds price.

Write me about your own particular case. Let me advise with you. What I can tell you will fit your case exactly. Then you can decide what engine to buy.

J. B. SEAGER, Gen. Mgr.

Some of the Features of the Olds Engine

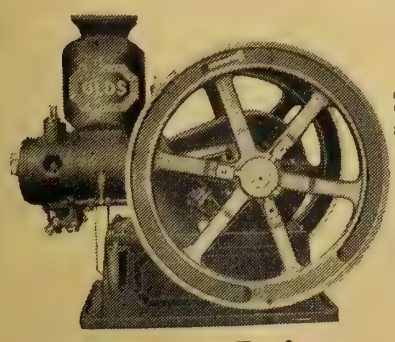
Olds Patent Seager Mixer

The only one that makes a perfect mixture of gas and air, giving the greatest power. No pump to leak or get out of order—no moving parts.

Removable Valve Mechanism. Removable Water Jacket. Jump Spark Ignition

Piston and cylinder ground to a perfect fit, giving better compression and more power.

Our catalogue explains these points in detail



4-A Hopper Engine

Simplicity, three separate inspections, durability, economy and certainty of operation.

Olds Engines are of the highest efficiency at the very lowest price because we can produce them without wasting a penny's worth of labor. There is a machine for every operation, and each piece, down to the smallest bolt or nut, is made of the very best tested material at a cost that could not be lower without cutting quality. Don't be misled by statements about "cheapness" in engins. Nobody can afford to buy a poor engine at any price, but there is a point where the highest quality can be had at the lowest cost, and the Olds Engine, because of the factory in which it is made, and the workmen who make it, stands without a superior in this respect. They are not slighted in places you cannot see, or where only an expert can discover it, but thoroughly well built through and through, in a factory that is known the world over as one of the most modernly equipped engine factories that has been built.

That is why we give you a durable, simple, strong, high-grade, perfect-working, long-lived engine at a low price.

Irrigating

You cannot afford to have your engine fail you when you require water for your crops. You buy both economy and insurance with an Olds engine. Made in all sizes from 3 H. P. to 100 H. P. Visit the nearest Olds Engine Pumping Plant. Ask the owner how he likes his Olds. There are Olds Engines in your neighborhood.

Write us for location.

Do Not Thing of Buying an Engine Without Investigating an Olds

It is to your decided advantange to send for our catalogue

Do it now before you forget it. A postal card will do; but better still write me a letter, telling me what you want the engine to do, and you will get a personal letter from me that will give you the facts you want.

Write me or my nearest representative. See addresses below

Write Today for Our Handsome Catalogue

It contains many fine pictures of the very latest models of Olds Engines with a detailed description that makes the engine question as plain to you as an open book. It contains letters from farmers who have used the Olds Engines, and they give their practical everyday experience with it.

Olds Engines are made in all sizes to suit every kind of work on the farm. We have exactly the kind of engine you want. Tell me what you want to do with it, and I will tell you just exactly the kind of engine you want to buy to do the work. It will be an expert opinion that costs you nothing.

Our hopper jacket engine on skids or wheels, 3 to 12 H. P., is ready to run when you get it. Fill it with gasoline, throw on the switch, turn the wheel, that's all. No piping to connect, nothing to set up, always ready, can be moved anywhere.

We also make regular engines 8 to 50 H. P. for heavier work.

Every Olds Engine is fitted with the Seager mixer which is recognized as being the most effective mixer that has ever been invented. No pump to leak. No moving parts to get out of order. They also have a removable water jacket so if through carelessness the water should freeze, but very little damage is done.

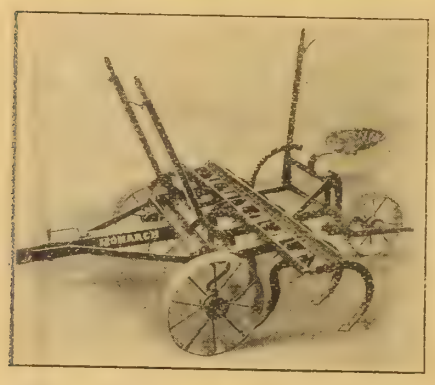
OUR MONARCH CULTIVATOR



Is designed for heavy work. Has great clearance (17 in.) between front and rear standards, which permits the working of trashy or lumpy ground, and lightens draught. While designed more especially for field use, it is now becoming a favorite among orchardists where deep cultivation is desired. By the arrangement of levers it can be carried level or deeper on one side if desired. Write

Western Machinery Company
230 Main Street, San Francisco, Cal.

The Monterey county Board of Supervisors will purchase and distribute no more squirrel poison until June 30. It is claimed that after that date the poison is more effective than at this season of the year.

The nut growing industry along the Columbia River in Klickitat county, Wash., is becoming a most prominent feature. The almond tree is most prolific and it is claimed six year old trees average 30 pounds.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Ground Squirrel Pest.

The squirrel is a pest in these parts, destroying a vast amount of grain and when that is harvested, taking fruit off the trees and even stripping deciduous trees of all foliage. Obviously the time to destroy these pests is after the grain and hay are harvested, but how best that is the question. Can you invite through the "Cultivator" replies to this query and publish the same. I believe strychnine the best and surest poison, but how to apply it; that is the rub. The poisoned grain of the stores is mostly inert. They thrive on it.—J. R. B.

With the law passed by the recent legislature compelling every one to cease from harboring this pest, it should now be easy to get all to combine in a campaign of extermination. Will our subscribers send in their methods of killing varmints. Let us have a bunch of suggestions from all over the state.

American Grapes.

Is the Isabella the only American grape grown in California and is it customary to head it low as with European variety?—J. W. D., Aptos, Santa Cruz County.

Nearly every variety of American grape is grown in California. All of the best varieties may be secured from the leading California nurserymen. Isabella should be trellised, do not prune it short.—J. W. M.

White Scale.

I send under separate cover a rose slip infested with insects. Please tell me what they are, also how to get rid of them.—Mrs. C., Escondido.

The insects on branch of the rose bush are good healthy samples of white scale, Icerya purchasi. These insects at one time practically ruined the orange groves of Southern California until they were conquered by a little lady bird, imported for that purpose. These little beneficial insects are now well scattered over Southern California and probably will soon find your white scale. However, if the infestation is bad and scattered over the place, you can secure the insects which will destroy them by writing to the State Horticultural Commission, Sacramento. If you have a bad infestation, the commission may wish you to send a few branches containing the white scale which may be used as "pasture" for some of the lady bird at the insectary. The name of the little beneficial insect is Novius Cardinalis.

Unless, however, the infestation is much worse than the branch sent to this office there is no occasion for worry. In fact, if you will make strong soap suds in which is a small cupful of kerosene well churned up it will probably be sufficient to destroy the scale.

Not a Milk Strain.

I have a cow, two years old, half Jersey, half Herford. She is now three months fresh and gives about half as much milk as she did three weeks before her last calf. She sucks herself despite every effort to prevent it. I have tied bags over her back and bag, have muzzled her, split her tongue, put a stick between legs and put nails in her halter and a stick in her nose. She gets around all of them. She is tricky, can open gates, is hard to drive up at night and I think sometimes holds her milk back. Her bag is large and I see no reason why she should not give at least three gallons per day instead of one and a half. Can you suggest a relief?—T. M. P., Mercedes, Tex.

No I should make beef of her for she is too wise if none of these things prevent her being a self sucker.—M. E. S.

Turkestan Alfalfa.

Please tell me where I can get seed of Turkestan Alfalfa and also of Paspalum dilatatum and which, in your opinion, is best for a small level pasture, not irrigation?—Mrs. M. K., Watsonville.

Seed men advertised in California Cultivator can supply you. We would prefer the Turkestan to. Paspalum. Paspalum requires moisture for satisfactory results.

Barren Strawberries.

Why are there no strawberries on our plants? The plants are two years old and very strong and healthy. They bloomed a month ago, and are still in blossom. The berries form and grow to be the size of a lead pencil, then dry up.—B. W. Martin, Elsinore.

You do not state what variety you have. Without knowing any more than you state, I should judge you have some pistillate variety. If so, you should have planted about every fifth row with some variety having perfect flowers so that pollen would be supplied to your present imperfect plants. If you have a pistillate variety now, there seems no help for you this season, as it is too late to plant strawberries. We have not found any variety so prolific and so satisfactory every way as the Brandywine, but you want to be certain you get good plants.—Q. A. L.

Grafting Grape Vine.

Please let me know if rooting Malagas planted this spring can be grafted to Muscats?—B., Kingsburg.

It is rather late to graft grapes. The latter part of March to the middle of April is the best time. Graft an inch or two below the surface of the ground and mound up the dirt to the bud of your scions. You can graft with small loss, vine one inch in diameter and up. If grafted when smaller than one inch, it is necessary to tie them in order to bind the scion in. Muscats will graft all right on Malagas.—J. W. M.

Canning Cherries.

I wish to can some sweet, well ripened cherries for home use, but folks say the black cherries will not keep well but almost dissolve into juice. Is this so, and is it the fault of the variety, or being too ripe, or faulty canning?—H. H. D., Los Gatos.

It is probable that fruit was overripe, or as some one has suggested, beet sugar may have been used, though there is a difference of opinion as to the effect of beet sugar in canning fruit. It has more friends now than it had a few years ago. Also, are you sure the can was perfectly air tight? If the fruit is very ripe, it is more likely to soften than the firm, fresher fruit.

Another has suggested that where fruit is put in water and brought to a boil, before adding the sugar, that

THE SAVINGS AND LOAN SOCIETY.

it is more liable to be soft than where syrup is brought to the boiling point and the fruit added to this. Even soft blackberries put in boiling syrup this way become very firm; so much so, in fact, that it is impossible to make nice jam of them if treated in this manner, therefore, if subscriber will put this season's cherries in the boiling syrup and try that and also test the effect of different sugars, she may have some suggestions for our next years' readers.

Beets for Cow.

Are beets the proper food for milch cows? After feeding our Jersey beets for a couple of months she acted queer. In attempting to drink she would jerk her nose out of the water as if she had toothache, but after a few trials would drink all right. Mentioning the matter to a friend from the East who has had considerable to do with cattle he said that the beets were the cause of the trouble and that while the beet increased the flow of milk and cattle would often fatten on them that after a time their teeth would become loose and finally drop out.—W., So. Pasadena.

When I first built a silo I was told that the cows teeth would all drop out, for they had done so in the East. I was told that it was useless to grow beets for the same old reasons. Now it is merely a case of not understanding how to read the conclusions correctly. Cows will have sore mouths if feed on any sort of woody tough food, or any pieces too large to be easily crushed. I can understand that the imflammation might even extend to the sockets of the teeth if any one kept them eating on these hard or rough pieces too long. Cut the beets up into pieces not more than a couple of inches square and mix them with hay, chaff, straw or bran, or feed them stirred into short alfalfa hay. A quart of the above to every gallon of the sliced or chopped beets. We cut ours, the mangel wurtzels when we used them, first with an axe and then run them through a hay cutter. Sugar beets can be fed to the hay cutter without first chopping them up with the axe.—M. E. S.

Grapes for Imperial Valley.

Please give advice in regard to the table grape proposition in the Coachella valley. I am planting out this spring about 20 acres to the Malaga grape and will continue each spring until 80 acres is in grapes. I wish to know which variety of table grape you would recommend and if only one variety. I wish to secure literature on culture and growing of the table grape and please advise me as to the best authority.—F. I. F., Riverside.

From the looks of the young vineyards around that part of the country I should think very favorably of is as a vineyard country. The Malaga and Sultanina (Thompson Seedless) are the best tested of the white shipping grapes. I should plant twenty acres of each. Ten acres of Muscats ought to find ready market for those sold in Los Angeles are never sweet like the ones from this portion of the country will be. The Emperor and Tokay do not color well they tell me in that region. The Cornichon is a good grape down there. I should try a few Dattier de Beyrouth, this is the most promising of the lately imported of varieties. It is a white grape, very late. We had some that were good on the vines in February and this was the wettest winter we had in many years. While the information given here is not my own experience, I believe it to be correct as it comes from the talks I had in the Demostration car. The people tell the demonstrators often more than we can tell them on the trips.—M. E. S.

Peach Leaf Curl.

I send leaves which have some disease. What is the trouble and what will cure it? They are from Lovell peach trees.—J. S., Parlier.

These leaves are seriously affected with peach leaf curl. There is no remedy for it at this season of the year. This trouble is more general this year than for several years. The treatment should have been given a couple of months ago before the trees leaved out. The best you can do now is to give trees plenty of cultivation and water and keep in as healthy a condition as possible. Then when perfectly dormant next winter spray thoroughly with Bordeaux mixture.

(Continued on Next Page.)

Now is the time of year that the ever present question prevading the family council is, "Where shall we go, or what shall we do this summer?" The planning and scheming period is now upon us when our thoughts turn from the sordid pursuits of city life; for man hath need of rest and he longs for the simple joys the country yields. We all wish to set aside for awhile the cares and worries of business and visit the Blessed Isles of rest and recreation.

To aid you in selecting a place for your outing or to locate your family for the summer so as to make possible week end trips, the Northwestern Pacific Railroad, the Picturesque Route of California, has issued a book called "Vacation." This book describes the garden spots and playgrounds of California in the counties of Marin, Sonoma, Mendocina, Lake and Humboldt. You can find in this book some place to suit your fancy and your purse, whether it is to fish, hunt, swim, rusticate on a farm, or visit the numerous mineral springs or resorts.

The issue of "Vacation 1909" is now ready for distribution and can be obtained from the Northwestern Pacific Railroad at the Ferry Ticket Office, the Up-town Office 874 Market St. and Room 986 (General Office) Flood Building, San Francisco, Cal.

Well machinery such as pumps and the equipment for making deep wells is coming to be of great importance to every town and every country community. The health of people and domestic animals imperatively demands pure water. Irrigation requirements are great and increasing. There is a chance for industrious skillful men to make a good steady income above that ordinary work, by operating the machinery of the American Well works, Aurora, Ill., and dealing in the supplies which are required directly and indirectly. An illustrated catalog may be obtained free on request. Mention this paper.

When writing advertisers, mention Cultivator.

Feeding Milk to Calf.

Please tell me how long a calf should be fed milk to make a good milch cow. Our calf is four months old, a very fine Jersey and we still give it milk, about a gallon a day, morning's milk at night and night's milk in the morning.—F. H. S., Fresno.

Stake this calf on green feed and begin at once to add skim milk to its feed, if there is no skim milk add water and gradually reduce the quantity in the morning until it receives none. Add water to the night milk and watch the calf, in a month's time it should require no more milk but live on grass entirely. Make changes gradually and watch effects, if the calf falls off, go slower in making the changes. Few calves receive any milk at four months on the dairy ranches where extra fancy stock is raised.—M. E. S.

Abortion.

I have a Jersey-Holstein which refuses to breed. Is there a remedy?—D., Brawley.

Have this heifer examined and if she is developed all right send to the C. I. Hood Co., Lowell, Mass., for breeding powder, which with its directions will probably be effective.

Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Establishing Corner Stakes.

A purchased five acres of land from a corporation receiving deed describing property as "South one-half of lot No.—, section—, township, range, etc., all known, as same is described on certain recorded map." The deed does not gi[ve] tell where t[he] lines and the[y] on any 5 or 1[0] find. From meas[ure] make I do not seem [to] and think neighbors encro[ach] the question is, is the comp[any] pelled to give me my corners boundary lines? There is said in deed about it. If th[ere] were any stakes they are [now] They may have been [put] present owners believe tha[t] pany who sub-divided the l[and] give us our corners.—A Subs.

The company cannot be co[m]pelled to survey your land for you cate the corner stakes. If sired that to be done, you have required it before you your deed. If the stakes place at the time you acce[pted] deed, it would be your duty them there, or re-establish th[em] L. P.

Diverting Storm Water.

Neighbor A has thrown up bankment and diverted water f[rom] iginal course. Neighbor B is ed to throw up an embankm[ent] keep this diverted water f[rom] land. These embankments ha[ve] ed the water to my land ov[er] has been spread silt and glory seed. If A had not water from its natural co[urse] not have had occasion to claims A had no right t[o] keep the water from hi[s] none of this water would on my land I am damaged county road is also being What course should I pur[sue] against whom? Do the su[per]have power to order A to ta[ke] his embankment and allow t[he] to follow its natural cours[e].—Subscriber.

If A's embankment would n[ot] forced the water upon your la[nd] cept for B's embankment, your of action is against B. If A's em[bank]ment, without B's, forced the upon your land and B's merel[y] to the damage, your action sh[ould] against them together. You give B notice to remove his em[bank]ment. Your right of action damages, or if the trouble from water artificially applied and B's land, such as irrigati[on] ter, for injunction. The county have to proceed through the unless the embankment is on property.—E. L. P.

Planting Near Line.

Please inform me as to the it is necessary to keep fr[om] property line of your nei[ghbor] planting eucalyptus trees.—[Subscri]er.

The law does not require keep any certain distance fr[om] property line in planting trees kind.—E. L. P.

Law of Inheritance.

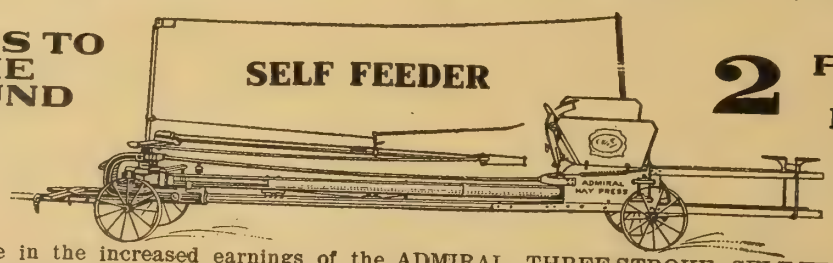
What is the law in M[ichigan] where a son or daughter dies making a will and one parent There are brothers and sist[ers] are the legal heirs?—W. bank.

If the intestate leave no husband or wife, his estate scend to his father; if no issu[e] husband or wife nor father, h[is] tate shall descend to his mothe[r]. no husband or wife or father mother or issue then in equal sha[res] to his brothers and sisters and to [the] lawful issue of any deceased broth[er] or sister by right of representation E. L. P.

There is an old adage which sa[ys] "An apple a day drives the doct[or] away." Certain it is that of all fru[its] which are within the reach of eve[ry] one none are so beneficial if [eaten] regularly. They act as a tonic [to] system and tend to purify th[e]

An Admiral Without Cost

3 FEEDS TO THE ROUND — **SELF FEEDER** — **2 PROFITS IN HAY BALING**



The difference in the increased earnings of the ADMIRAL THREE-STROKE SELF-FEED PRESS more than pays for the press in one season, at a conservative estimate of 2½ tons per day over the old style two-beat, foot-feed press, besides the ease of labor on both men and team, and better work. Let us figure a little to convince you.

2½ Tons per day for one week, 15 tons at $1.50 net.....$ 22.50
One month's earnings over the other press (26 days)..... 97.50
On an estimate of five months' work out of the year..... 487.50

The above gain with the ADMIRAL more than pays for the press.

New Century Hay Presses, Specially Built, Season of 1909, **$250.** All kinds of Wagons, Buggies, Implements, Tools, etc. Catalogues upon request.

USE OF THE DISK HARROW AND THE ROLLER.

SHORT time ago I received a letter containing such a good set of question about the disk er that I do not think that I better than to use the ques- subject of this talk.

—I desire especially to o use the disk harrow in a seed bed. Will it do as a te for the drag harrow or both be used?

finished with a disk harrow used for a seed bed, but the actice is generally to use both. y smooth surface may be made dium to light soils with the especially on land that is double d by lapping half each time. e medium to light soils would pulverize most readily by a drag ow. The disk is especially useful rking heavy, tight, land, While isk is about the best pulverizool it is apt to leave the land d. The smoothing down of these s with the drag harrow leaves and with a smoother surface.

stion.—Would you disk fresh n land where the ground is w and is good tilth when turned? why? Will the disk harrow to pack fresh plowed ground and t as a substitute for a sub-surpacker, where the packer, cannot ?

ld disk fresh broken land es- where I did not have a pack- ould scarcely like to say that the disk will act as a substitute for the packer, but there is no doubt but the disk if set fairly straight, will pack the soil and fill up the big spaces between the furrow slices to a considerable extent.

Question.—If last year's stubble be disked will it arrest evaporation and tend to preserve the moisture until land can be plowed later?

Yes. Mr. Campbell lays great stress on disking stubble or sod for two reasons, first, to open up the surface and let in the water, and second, for the production of a mulch to retain moisture. Sometimes a piece of ground is too dry at the surface to plow, while there may be a good deal of moisture some distance below the surface. In such case making a mulch by double disking would allow the moisture to accumulate nearer the surface, and land could be plowed later. I think that our New Mexico farmers are making a great mistake in not using the disk more freely on their stubble and sod land before plowing.

Question.—Would you advise rolling fresh plowing ground for the purpose of packing it and following this with harrow to leave dust mulch?

Yes.

Question.—What is the value of a roller in dry farming?

The roller is a tool which must be used with much judgment in dry farming, as its possibilities for working injury are fully as great as its possibilities for good. It can be used to great advantage in packing down sod which is broken shallow in the spring. It is valuable for crushing clods. Some day our farmers will be able to dispense with it for that purpose, because they will pay much closer attention to the moisture condition of the soil at the time of breaking, and will find that they will have much less need for a clod crusher than at present. Another condition that sometimes arises under which the use of the roller is very essential is where seed has been planted in a soil which is quite moist below, but dry near the surface. Rolling will compact the surface, thus causing concentration of the moisture there for a short time, and give the seed a chance to sprout. If the surface remains packed for very long, the soil will dry out. The great danger in the use of the roller is that it leaves the surface fine and compact, which favors evaporation. The surface should always be loosened, best with the drag harrow, after it has been rolled The essential difference between the roller and the sub-surface packer, is that the roller packs the surface of the soil, leaving it in a condition which favors evaporation, while the packer firms the plowed layer against the plow sole and leaves the surface loose.—J. D. Tinsley, New Mexico College of Agriculture.

The United States Forest Service is aiding farmers and stockmen about Alberquerque, New Mexico, against prairie dogs which have done immense damage. Nearly ten thousand pounds of wheat was poisoned to be used in the campaign.

BANKING PRINCIPLES IN FARMING.

The absolute necessity of conserving the fertility of the soil has never been more aptly and emphatically expressed than by James J. Hill, the railroad builder, when he said: "You can no more take wheat from the soil continuously than you can take money out of a bank without making deposits."

Mr. Hill counts restoring fertility to the soil a far more important question than tariff, banking, trusts or any other of the topics that find frequent discussion. He believes that if America is to continue great and wealthy it must nurse that which is the source of the greater part of its wealth; the soil.

Nor is Mr. Hill so patriotically narrow-minded as to think that America has nothing to learn from other countries. The average citizen is proud of American farms and their products; he talks boastingly of them in superlative terms. But the fact remains that America has much to learn from foreign lands in this very matter of soil fertility. The present average yield of wheat to the acre in the United States is 13.88 bushels; in England it is 30 bushels; in Denmark, 38; in Netherlands, 34; and in Germany, 27. In none of these countries are soil and climatic conditions more favorable for raising wheat than in the greater part of the United States.

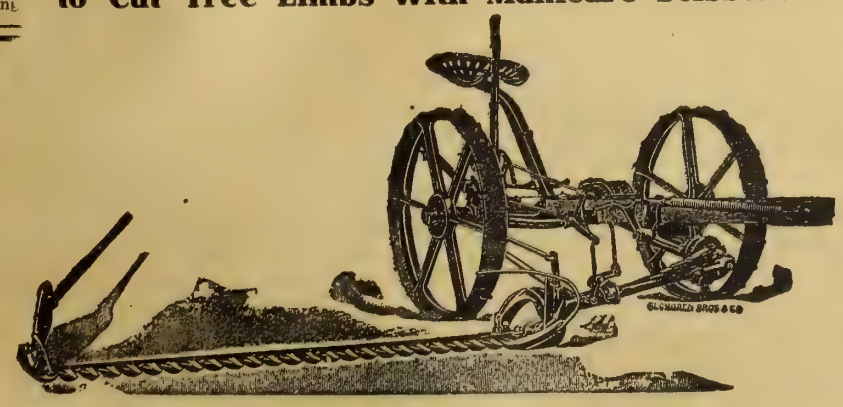
The moral is just this; the farmers of those countries have not contented themselves with going up to the bank window and drawing out day by day,

Did You Ever Stop to Think

That the Lightest Looking Mower Is Very Apt to Cut Heaviest;

ALSO

That Only a Very Foolish Person Will Try to Cut Tree Limbs with Manicure Scissors



The New Standard Mower

All power in a Mower originates from the grip of the wheels on the ground,—the firmer the grip the greater the cutting power.

The 5-foot New Standard Mower weighs 825 pounds. The entire weight of the cutter bar (while cutting) is transferred through the suspension spring to the main wheels. The bar is neither pulled nor pushed,—it is carried—an exclusive Standard feature.

The power thus secured is transferred to the gearing through the mechanically perfect wheels, found only on the New Standard Mower. The gearing develops high speed without undue strain and passes the power to the knife. The knife works in our famous curved Cutter Bar,—the only frictionless knife channel made.

These are a few reasons why the New Standard Mower is the most powerful cutting mower made.

A folder giving full detailed description of the New Standard Mower and our other Haying Tools will be mailed free on application.

FARM LANDS FOR SALE.

RANCHERS, ATTENTION—OUR SPECIALTY, oranges groves and ranches. If you have one to sell or exchange, list with us. We have many customers, who wish to buy and exchange for country property. Los Angeles Purchasing Co., 404 Chamber of Commerce, Los Angeles, Cal.

TULARE CITRUS BELT—WE HAVE the cheapest and best orange lands right here. If you want reliable information about this glorious country, write STRATHMORE REALTY CO., Strathmore, Tulare Co., Cal. Excursion fares from Los Angeles, Cal.

FOR SALE—PALOMITAS VINEYARD 194 acres; 106 planted to choice Emperor, Malaga and Muscat vines, 3 to 5 years old Part or all. Half cash, balance on easy terms. MRS. M. E. SHERMAN, Fresno, Cal.

ORCHARD HOMES FOR SALE—FIVE acres and upwards; fine citrus and deciduous fruit lands on easy instalments and low interest. Write us today. WYATT & WILSON, Winters, Cal.

FOR SALE—TULARE CITRUS BELT right here at Exeter, small tracts, small payments, terms, our home 52 years, also dairy ranches. FRED M. HART, Hanford, Cal.

I MAKE A SPECIALTY OF ORANGE and alfalfa ranches and exchanges. 626 Main St., Room 9, Riverside, Cal. N. R. BELL.

TREES.

SPECIAL PRICES TO TRADE AND planters on grafted and seedling walnuts, Elberta, Muir, Lovell, Phillip Cling, Leavy Late, Lemon Cling, Satsuma plum, lemons and apples in variety. A. R. MARSHALL'S NURSERIES, Box 64, Santa Ana, Cal.

SEED.

FOR SALE—CALIFORNIA BLACK walnut seed in sack lots. Wanted: Mayette, Franquette and Parisienne Walnut scions, also Rupestris St. George, Rip. x Cord. x Rup. 106-8, Rip. x Rup. 3306 and 3309 cuttings grafting size. Address FANCHER CREEK NURSERIES, Fresno, Cal.

FOR SALE—ORANGE SEED SELECTED from choice groves, can supply any quantity at reasonable prices. K. W. LATTIN, 20 West 4th St., Alhambra, Cal.

HORSES.

FOR SALE—ABOUT 200 HEAD OF work and brood mares, including young mules and horses from one year to four years of age. One full blooded Percheron Stallion four years old in May. One Jack about seven years old. Several full blooded Poll Angus Bulls and a number of full blooded Durhams. CHAS. W. HART, Farmersville, Cal.

FOR SALE—YOUNG JACK, FIFTEEN hands, Kentucky bred from Starlight Jeuett. Imported sire. Price one thousand dollars. SCOTT LEWIS, R. D. 1, Box 77, Santa Paula, Cal.

FERTILIZERS.

NOW IS THE TIME
to fertilize for results in the coming crop.
ARMOUR'S "O.T.M.", "B.B.&P.", and "5-8-2" grow big crops and build up the soil. They have been doing it for years.

ARTICHOKES.

FOR SALE—JERUSALEM ARTICHOKES, the great winter hog feed. Address, FANCHER CREEK NURSERIES, Fresno, Cal.

HOGS.

REGISTERED BERKSHIRE AND POland China hogs, both sexes. C. A. STOWE, Stockton, Cal.

GRAPE CUTTINGS.

STRONG OUT DOOR GROWN ROOTED cuttings. All kinds of plants. Send for 1, 2, 3c list. GEM NURSERY, Los Gatos, Cal.

MECHANICAL ENGINEER.

GAS PLANTS FOR LIGHITNG, COOKing and heating installed complete in private homes. Estimates furnished and expert advice given. R. WALTER WILSON, 1022 E. 49th St., Los Angeles, Cal.

SWEET POTATOES.

FOR SALE—YELLOW SWEET POtato plants. J. W. BROWN, Home Phone 643, Downey, California.

HELP WANTED.

A BEE MAN WANTED—THE USUAL wages paid and board furnished. About 300 stands. Address immediately, Box 695, Wasco, Kern Co., Cal.

POULTRY

WHITE WYANDOTTE AND WHITE Orpington eggs from choice matings, $2.50 per 15. A. W. HUSKINS, 713 Waterloo St., Los Angeles, Cal.

BARRED ROCKS, RINGLET STRAIN, direct from the famous E. B. Thompson pens, New York. Have taken more prizes than any other Rocks at The Madison Square Garden Shows. For beauty, size and laying quality, unequaled. Eggs per setting $1.50 and up. Reduced rates on incubator lots. Special matings. $3.00 per setting of 15; 2 settings $5. Agent for The Potter System of Selecting the Laying Hen. Price $1.00. A. C. CISSELL, 1812 Santa Monica Ave., Los Angeles, Colegrove car to Swan street.

M. E. DILLINGHAM, SAN GABRIEL, Cal., is selling out: About 20 golden Seabright Bantams, $2.50 per pair; 7 pairs Black Tail Japs, $2.50 per pair, all Partridge Cochine Bantams same price; 1 trio Black Breasted Red Game Bantams, $3.00; Buff Cochin Bantams, $2.50 and up per pair; and also 1 pen White Wyandottes, 1 male and 10 pullets, $12.00.

SILVER CAMPINES, GREAT LAYers, non-sitters, beautiful fowls, splendid foragers. Recently imported from Belgium. Eggs for hatching $3.50 per doz. Write for circulars. E. SMITH, 3527 Dauphin St., Los Angeles, Cal.

BLACK MINORCAS—FINEST QUALity. Bred to lay big white eggs and up to standard size. Eggs $1.50 to $3.00 setting. Grand Cockerels reasonable. J. P. McDONOUGH, Geyserville, Cal.

BUFF PLYMOUTH ROCKS, BRED TO lay, win and pay. My birds have won more prizes than all competitors combined. Eggs and stock. Circular. DR. W. H. HOLMES, Slavin Block, Pasadena, Cal.

BUFF ORPINGTONS — THOROUGHbred and first prize stock and eggs for sale. Will sell pens, trios, etc., at special rates. I am closing out to quit business. MRS. E. G. WALL, 1920 Monticello Ave., Hollywood, Cal. Phone 59829.

WHITE MINORCAS (EXCLUSIVELY), standard bred, prolific layers, large white eggs. Eggs (after April 1st) $1.25 for 15; $3.00 for 45; $5.00 for 100. L. V. PETERSON, Guerneville, Cal.

PARTRIDGE WYANDOTTES—C. ANdrews, 823 W. Franklin Ave., Hollywood, Cal.—1st cock, hen, cockerel and pullet; 2 cups, Poultry Breeders' Show, 1908.

WHITE PLYMOUTH ROCK STOCK, eggs, baby chicks for sale. Eleven prizes last State Fair. RICHARDSON, 42 Sacramento Ave., Sacramento, Cal.

MAMMOTH BRONZE TURKEYS — Eggs fifty cents each. None in West larger or finer marked. Laid by old hens. MRS. LAURA E. HARDING, Brawley, Cal.

WHITE MINORCA EGGS FOR hatching, $5.00 per 100 after March 15. Some prize winners. MRS. E. BANTA, Calistoga, Cal.

PRIZE - WINNING WHITE MINORCAS. Eggs for setting, $2 for 15; $3 for 30; $6 per hundred, f.o.b. express. C. S. LANE, Santa Barbara, Cal.

FOR SALE—BABY CHICKS, ALL VArieties, 100 lots upwards. J. STANSFIELD, 3301 East 14th St., Fruitvale, Cal.

S. C. BROWN LEGHORN EGGS $1.50, $2.50 and $5.00 per setting, $5.00 and $7.00 per 100. MRS. C. H. VARY, Pomona, Los Angeles Co., Cal.

RHODE ISLAND RED EGGS FOR hatching, $1.50 for 13, $7.00 per hundred. CHAS. F. TUTTLE, Phone Main 1294, P. O. Box 320, Altadena, Cal.

O. L. CRANE, BREEDER OF PIT AND Cornish Indian Games. Rural No. 3, Santa Rosa, Cal.

SHOPPING BY MAIL.

DO NOT WASTE TIME AND MONEY going to Los Angeles for shopping or business matters which could be attended to by experienced men and women familiar with conditions there. Write us, COLUMBIA COMMERCIAL CO., 204 E. 9th street, Los Angeles, Cal.

PURCHASE THROUGH US—WE ARE a Mail Order House. We furnish anything desired from a spool of cotton to an automobile. Send for catalog. COLUMBIA COMMERCIAL COMPANY. 204 East 9th St., Los Angeles, Cal.

SITUATIONS WANTED.

A CHRISTIAN GERMAN WITH FAMily wants position immediately to take charge of orchard or farm. Is an experienced machinist, able to repair pumps, engines and all farm machinery. Address, OTTO REHWALD, 147 North Boylston St., Los Angeles, Cal.

year after year, without every little while making deposits which should give them a working balance. The same principle applies in agriculture, and the farmer who is succeeding now, and who is to succeed in the future, either in America or any other country, is the one who deposits the elements of fertility in the soil, as he deposits money in the bank, in greater amount than he draws out.—Iowa Homestead.

INVESTIGATIONS TO IMPROVE ALFALFA.

Alfalfa forms the basis of our agriculture throughout the western states; its unique adaptation to semi-arid conditions makes it an invaluable asset. Owing to its power to survive a drought, to exist on scanty moisture, its root system enables it to reach a deep-lying supply of soil fertility that is beyond the reach of common plant roots, but which will in turn become available to any crop if the proper crop rotation with alfalfa is established.

The power of alfalfa to restore worn out lands, and to improve soil that is deficient in humus and nitrogen is apparent to the most casual observer who will compare the crops grown on alfalfa sod with those grown on ordinary soil or even where barnyard manure has been heavily applied. Realizing these facts, it is evident that alfalfa should be more extensively grown in our crop rotations to maintain and restore the soil that is being depleted by the large crops of sugar beets and other products.

Many acres of alfalfa hay are sacrificed each year for the more remunerative returns from beets, cantaloupes or potatoes and, as a result, alfalfa hay is becoming scarce and the price is advancing to a point that will tend to dishearten the stock feeder. Also, the high prices realized for hay have not encouraged saving the alfalfa crop for seed; consequently the price of good alfalfa seed is about equal to the cost when it was first introduced. In the estimation of some the high price of land in the irrigated sections precludes the use of alfalfa as a profitable crop; especially on the small tracts and even on the larger farms, the proper proportion of alfalfa to other crops is seldom maintained, and evidently the real merit of alfalfa is overlooked.

When expensive land is occupied with alfalfa for recuperation, which soon or later will become necessary, it is apparent to all that it should be made to yield the highest returns possible, in hay, seed or fertility. To this end the alfalfa seed breeding work has been instituted. The idea was suggested in 1904, when investigating the insect injuries and other causes for the poor yields of alfalfa seed in the lower Arkansas valley in Colorado. It was then noted that there was a great contrast in the seed yield of different plants under apparently the same condition; also, that the type and quantity of hay from different individuals varied. Seed from some of the most promising plants was secured and sown the following season in a comparative test with the common alfalfa, and some Turkestan seed from Germany. Later the nursery was increased to sixty-four plats of different varieties and individual types. The nursery has served as a comparative test to determine the relative merit of these different types of alfalfa, and it is almost needless to say that the most remarkable contrasts in desirable qualities have been developed. Some of the traits superior to ordinary alfalfa that have been shown are as follows:

Hardiness; freedom from winter killing.

Large stooling; eight to ten times as great as common alfalfa.

Frost resistance in the green growing plant.

Desirable type for hay; fine stems, many leaves.

Freedom from tendency to lodge with wind or rain.

Seed setting tendency, satisfactory.

The contrasts in desirable qualities found in the nursery is evidence of a great opportunity to improve the ordinary alfalfa by seed selection, and the results of the few year's selection is assurance that such improvement would be immediate for our alfalfa crop, if a supply of such seed were available. We have bred up our corn, wheat, potatoes and beets, but with our alfalfa seed we have been satisfied with the work of an Arab. Alfalfa has been alfalfa, and the man that produced seed sold his best and seeded his fields with the tailings from his fanning mill.—P. K. Blinn.

MACHINERY.

FOR SALE — ELECTRIC MOTORS from 5 to 30 H. P. in second hand, also complete line in new. Electric generators always on hand. See us for any electrical machinery, can save you money. BAILIE & BRANDT, 943 N. Main St., Los Angeles, Cal.

FOR SALE—12 H. P. UNION STATIONary engine cheap. Can be seen running. MACHINERY EXCHANGE, N.W. Cor. Main & Bruno Sts., Los Angeles, Cal.

FOR SALE—RENT OR EXCHANGE, boilers and engines, gas engines, pipe and oil well casing, pumps, all sizes and makes; get our prices before you buy. A. CANNADY & CO., 691 N. Main St., Los Angeles, Cal.

FOR SALE—MEHRING MILKING MAchine with extra parts and covered pail, all in good order. WM. H. BIRD. Box 6, Compton, Cal.

FOR SALE—CENTRIFUGAL PUMPS of standard makes and sizes, both new and slightly used at exceptionally low prices, also pump fittings. BAILIE & BRANDT CO., 943 N. Main St., Los Angeles, Cal.

FOR SALE—CHEAP, BRAND NEW grain mill for two or three H. P. WM. MANTZ, Santa Maria, Cal.

"ON THE SQUARE."

Secretary Chas. A. Chambers of the Fresno Nursery Company sends us a bunch of "On the Square" pencils. We have tried them and find them true to name. That is, like the firm from which they come, they are strictly "On the Square."

Long may the Fresno Nursery Continue to be "leading growers and dealers in fruit trees and grape vines."

THE CENTURY.

The May Century has fiction a plenty—the last chapters of Alice Hegan Rice's novel, "Mr. Opp," and stories in which humor is the dominant note by Mary Heaton Vorse, Adeline Knapp, and W. Albert Hickman—but leading place is given to Thomas Nelson Page's story, "The Old Planters," a tale of a quaint old hostelry in Virginia, and of the quaint old aristocrats who played host, and of the guests who came and went.

Not the least interesting and important article of the number is the narrative of how, in less than six years, 388,000 American farmers have pulled up stakes in "the states" and moved to free homesteads in the Canadian Northwest. That story is told in "The Last Trek to the Last Northwest," by Agnes C. Laut, author of "The Conquest of the Great Northwest," who has traveled through all the territory of which she writes.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

Bees and Their Care

EXTRACTION OF BEESWAX.

IN view of the increasing interest in apiculture and the lack of definite information on the subject of the extraction of beeswax, an important product of the industry, F. C. Alford, of the Colorado Station, has made a study of the relative efficiency of different methods of extraction now in use. He experimented with solar extractors, those using steam, and those using pressure under water heated sufficiently to melt the wax. In the latter method he used water alone and water containing sulphuric acid.

The solar extractor used by Mr. Alford was simple in construction and can be made by anyone who is handy with tools. It consists of a wooden box about 30 inches long, 16 inches broad, and 6 inches deep. This box is lined with tin and near one end has a wire-cloth screen to allow the melted wax to run down into a pan at the lower end of the box. The waste wax and brood comb were placed in the upper part of the box, which was set at an angle toward the sun and covered with glass, preferably double. The size of the solar extractor will be determined by the amount of wax to be extracted. If desired, a lamp may be used to furnish additional heat. A hole should be cut in the bottom of the box, so that the heat of the lamp will strike the tin lining under the wire screen. The lamp should be protected from the wind. The use of a lamp increased the efficiency of the extractor about one per cent. A like increase was obtained by soaking the comb in water for several days before extraction—a practice followed by some bee keepers. Soaking the comb for three days in a 5 per cent solution of sulphuric acid increased the yield of wax about 5 per cent.

Three kinds of steam extractors were tested in these experiments. Tests were also made of pressure under water with and without addition of 5 per cent of sulphuric acid.

Pressing under Water.

The comb, with some water, was put in a tub on the stove and the wax allowed to melt, but not to boil. A can was placed under a press and a slatted follower placed in the bottom of the can. Above this was placed a burlap bag and the hot water, melted wax, and comb were poured into the bag, the top of the bag folded over, a slatted follower paced on top and pressure applied by means of a screw. After some of the wax had been forced out, the water and wax were drawn off, the pressure relieved, the "slumgum" stirred, hot water added, and pressure applied again. The can, which fits under the press, has two holes which are stopped by corks. One is at the bottom and the other near the top. By pulling the cork out of the upper hole the wax which has risen to the top can be drawn off and by using the lower hole all of the wax and water can be removed. The whole apparatus must be kept as warm as possible. * * *

Sulphuric Acid and Pressure under Water.

It was thought that the addition of acid to the water in the experiment might increase the efficiency of the method. The comb was heated in a porcelain-lined tub with a solution of 5 per cent commercial sulphuric acid. When the wax had melted it was poured into the sack in the press and pressure applied quickly in order not to have the acid in contact with the metal any longer than necessary. The wax and water were drawn off, boiling water added, the slumgum stirred, and pressure applied again. This water was drawn off and put with the rest. As this was an experiment to determine the efficiency of the press a tin can was used, but in practical work it would be necessary to have everything acid proof, as hot acid, even when diluted, is very destructive to most substances. The can could be made of wood or porcelain-lined ware. The latter would probably be the better.

This method was easy to manipulate and rapid and was the most efficient of all the methods used.

The results reported show that "the slumgum from 100 pounds of wax treated by the ordinary solar wax extractor will retain from 34 to 36 pounds of wax, which can be removed by heating with dilute sulphuric acid and pressing under hot water. With the best of the steam wax extractors used there remains in the slumgum about 7 pounds of wax which is obtainable by the use of the sulphuric acid and pressure. With the price of wax at 25 cents a pound it would pay to buy old slumgum and remove the wax by this method."

The wax obtained with the steam extractors "did not have a good color, and would have had to be refined before it could be used. The wax from the solar extractors was always a better color than that from the steam extractors. The wax formed by pressure under water was nearly as good in color as the wax from the solar extractors. The wax obtained by pressure under water containing 5 per cent of sulphuric acid was very good in color, in fact, almost as good * * as most of the wax obtained from the solar extractors."

Wax from old brood comb is too dark to be used for comb foundation, so that some satisfactory method of bleaching must be employed. Various methods of bleaching were therefore tried, but most of them either destroyed the wax or were in themselves poisonous.

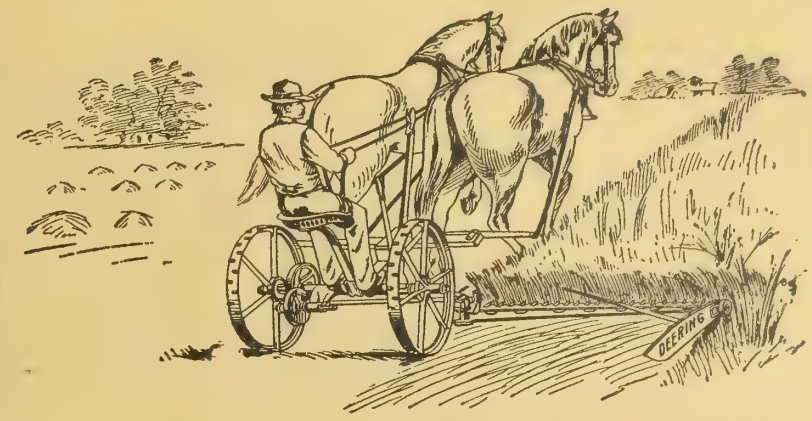
As a result of these experiments and from his experience in handling bees and rendering wax Mr. Alford expresses the following opinion:

"It is best for the average bee keeper to have a large solar wax extractor, heated by some artificial heat, by means of which most of the wax in the lighter colored combs, cappings, and burr combs may be easily rendered. The dark combs may also be treated in this manner and the slumgum stored in barrels until the bee keeper has time to treat it with dilute sulphuric acid and press under water. This method is quick and efficient. If the wax has to be refined it can be done by heating, while inclosed in a canton flannel sack, with a solution containing 5 per cent of hydrogen peroxide and 2 to 5 per cent of sulphuric acid. Both of these chemicals can be bought at the ordinary drug store. The common kind, commercial, should be used."

In mixing the acid and the water care should be taken to always pour the acid gently into the water and not the water into the acid.

The cost of the chemicals compared with the results obtained is very slight.

Deering Ideal Mower



When it comes to the test the Deering ball and roller bearing mower is ahead of them all—the lightest draft—simple—durable—with few parts to wear or get out of order. Cuts from the start in heaviest grass or grain—a pleasure to use and a satisfaction to own.

We sell highest grade harvesting machinery of all kinds, including the light-running, ball and roller bearing Deering Headers. Get your orders in now. Catalogues, description and testimonials on request.

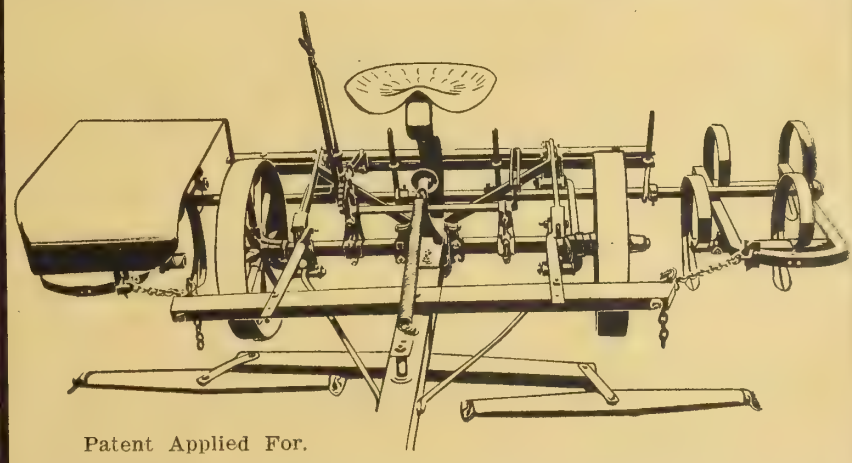
Graber's Attachment Cultivators



Patent Applied For.

The Only Cultivaror that will cultivate under fruit trees without injuring Fruit or Trees.

These attachments can be attached to any riding cultivator in two minutes time, making a complete 4-horse cultivator when in use with the rider, or you can raise the teeth out of the ground on the rider and drop the attachments by the aid of the four hangers which are held in place by clamps, thus making a 2-horse machine.

Best of all—we give you a 2-horse machine for less money and does work that no other 2-horse cultivator can do. We put these attachments out on trial.

Write for full particulars and prices.

ATLAS E-Z SEAL JAR

When preserving time comes round and the "jar question" comes *up*, you will decide wisely if you choose jars of the "Atlas" brand -they are far superior to all others. The Atlas E-Z Seal Jar shown below is an *instant* and *perfect* sealer. It has a *wide mouth*, that permits the preserving of whole fruits. It is extra strong at the top and *not* easily broken. It is made by machinery and therefore of uniform thickness and perfectly smooth finish. The most convenient jars to *fill*, *empty* and *clean* are "Atlas" brand jars.

ATLAS SPECIAL MASON

is another extra good jar. It possesses every advantage of the E-Z Seal — strength, wide mouth convenience and smooth finish, but closes with a screw cap. Made specially for those who prefer this kind.

A Book of Preserving Recipes

Sent free to every woman who sends us the name of her grocer, stating whether or not he sells Atlas jars.

If your dealer cannot supply these jars, send $3, and we will express prepaid thirty (30) quart size ATLAS E-Z SEAL JARS to any town having an office of the Adams or U. S. Express Co., within the States of Pennsylvania, New Jersey, New York, Delaware, Maryland, Virginia, West Virginia, Ohio, Illinois, Indiana or Michigan, or we will quote delivery prices in other portions of the United States by freight or express.

HAZEL-ATLAS GLASS CO., Wheeling, W. Va.

WOULD YOU LIKE TO SLEEP ON A MATTRESS

That is guaranteed to be absolutely hygienic?
That insures healthy, comfortable sleep?
That possesses all the good qualities of the finest hair mattress at about one-half the cost?
That is made in a factory where every precaution has been taken to insure the most perfect sanitary conditions?
That is made by skilled workmen in the most approved manner and the latest style?
That is guaranteed to give perfect satisfaction or your money promptly and cheerfully refunded?
That costs $15.00 for the full size, $12.50 for the ¾ size, $10.00 for the single size and is positively the best mattress made anywhere at these prices?

OUT OF THE WEST.

Out of the West, when the sun is low,
Comes the mellow light of the afterglow.
Out of the West, the sun breaks through
To tinge with gold the clouds dull hue.
Out of the West, the wind is sent
To clear the sky when the storm is spent.

Out of the West comes the yellow gold,
For this may life be bought or sold.
Out of the West came man who won
The laurel wreath of the champion.
Out of the West came the fastest horse
That ever sped o'er the trotting course.

Out of the West the ripe fruit goes
To cheer the East, midst its winter snows.
Out of the West, a city fair
Was plunged in a day to deep despair,
Out of the west rose a heartfelt prayer
For the countless ones who perished there.

Out of the West rose a city grand
It's first stones laid in the heated sand.
Out of the West comes the voice of praise
For those who toiled through the first dark days.
Out of the West let us send the call:
"Here is a welcome for one and all."

Out in the West we have built our home,
And out of the West we ne'er shall roam.

—B. W. McGrath, Cloverdale.

IN THE DARK.

SOME one had kissed Eileen in the dark. Who it was she had not the slightest idea. The man had stealthily stolen up behind her, while she was walking down the dark hallway to her room, and had planted a resounding smack on her lips before she had more than time to draw her breath. She was convinced though that some male member of the house party was the guilty person.

Eileen did not scream when she was kissed. Instead she marched to her room very, very angry, and there meditated revenge. Consequently, after a talk with her pretty maid, she told the assembled guests at the breakfast table the following morning, this story:

"'My maid," she said, "had a most disagreeable experience last night. While she was coming down the dark hall to my room, some man—who is unknown—kissed her!"

Eileen was surprised at the impression her statement made. All the guests showed deep interest, but two men in particular drew her attention. Elson Jacobs, handsome and young, directly across the table from her, turned deathly pale and the butler, standing directly behind him, turned a most embarrassed red. The guilty party must be one of these two men! Eileen felt a thrill of chagrin as she contemplated the fact that it might have been the butler and her heart beat rapidly when she thought that it might have been Elson.

Following the meal Elson came up to her.

"You say it was your maid that was kissed?" he asked.

Eileen nodded. A most sickly look came over Elson's face. Without a word and with dejected tread, he dragged himself away.

Shortly after the butler came to Eileen.

"I only thought I'd better say, mum," he exclaimed with extreme embarrassment, "that it was all right about your maid. She's engaged to me, mum, so it was all right for me to kiss her."

"You did kiss her in the hall last night?"

"Yes mum."

Eileen felt a pang of pure dismay at this. She felt sure that the butler had made a mistake—that he had kissed her instead of her maid. And yet, why should Elson act so queerly? Eileen felt very ill at ease. In despair she hurried to her room where the maid could be found.

"Mary," she cried to the girl. "You know what I told you about telling the guests that you and not I had been kissed? Well, it has turned out very badly. It looks as if I had been kissed by two men instead of one. It's horrible. The butler—"

Mary stopped her imperiously.

"Was he kissing you, too?" she asked.

"Oh, did some one kiss you in the hall last night? Why didn't you tell me about it?" cried Eileen.

"Sure, I don't think I had to be telling you all that; but he met me and talked, and then he did kiss me."

Eileen with a huge sigh of relief, rushed from the room. At the foot of the stairs she met Elson.

"Eileen," he cried, "I meant to kiss you last night. Tell me I didn't make a mistake and kiss your maid instead?"

"How could I tell," she replied archly. "I didn't see the man that kissed me and—and there's only one thing he did that I could recognize him by."

Elson with a laugh of pure joy rushed toward her, but Eileen, her face scarlet, rushed from him up the stairs.—Spokesman Review.

RECEIPES.

Cream Chicken.

Two cupfuls of cold chicken, one large cupful of cream sauce, a little chopped parsley, about one-half teaspoonful of salt and pepper. Cut the chicken into even pieces before you measure it; heat in the sauce until very hot, but do not let it cook; then season.

Stewed Celery.

Cook the celery in slightly salted boiling water until tender, having first cut it into half-inch pieces. Bring one and one-half cupfuls of milk to a scald, then pour it slowly over the well-beaten yolks of two eggs and one-half cupful of rich cream. Cook until it thickens, without boiling, season with salt and pepper, then pour it over the celery in a heated dish, and serve at once. Or the milk may be thickened with a little flour or corn starch if preferred. Stewed celery is very nice served on small squares of hot buttered toast.

Celery Stuffing.

For chicken and turkey, celery makes a delicious stuffing. For turkey use about one pint of finely chopped celery, one tablespoonful of minced onion, one teaspoonful of minced parsely, one-half teaspoonful of powdered thyme and the juice of a large lemon. Add one breakfast-cupful of oysters cut rather small, one teaspoonful of salt and two or three dashes of pepper. Fill the turkey with this, and sew it up. To make the turkey more tasty, baste it fre-

quently with a mixture of melted butter and oyster liquor.

Celery Sauce.

This sauce is to be served with vegetables. Take cream or rich milk and boil with pieces of celery till flavor is extracted. Remove it, and season sauce with salt and pepper. Add butter, then a little flour for thickening.

WHAT CAN BE DONE WITH SALT.

Salt cleanses the palate and furred tongue, and a gargle of salt and water is often efficacious. A pinch of salt on the tongue, followed ten minutes afterward by a drink of cold water, often cures a sick headache. Salt hardens gums, makes teeth white and sweetens the breath. Cut flowers may be kept fresh by adding salt to the water. Weak ankles should be rubbed with solution of salt water and alcohol. Rose colds, hay fever and kindred affections may be much relieved by using fine dry salt, like snuff. Dyspepsia, heartburn and indigestion are relieved by a cup of hot water in which a small spoonful of salt has been melted. Salt and water will sometimes revive an unconscious person when hurt, if brandy or other remedies are not at hand. Hemorrhage from tooth-pulling is stopped by filling the mouth with salt and water. Weak and tired eyes are refreshed by bathing with warm water and salt. Public speakers and many noted singers use a wash of salt and water before and after using the voice, as it strengthens the organs of the throat. Salt rubbed into the scalp or occasionally added to the water in washing prevents the hair falling out. Feathers uncurled by damp weather are quickly dried by shaking over a fire in which salt has been thrown. Salt always should be eaten with nuts, and a dessert fruit salt should be specially made.

HOMELY HINTS.

Constant exposure of mirrors to the direct rays of the sun is apt to crystalize the amalgam and destroy the brilliancy.

Strong hot vinegar will remove paint from window glass.

A little milk added to the water in which silver is washed will help to keep it bright.

To revive the luster of morocco or any other leather apply the white of an egg with a sponge.

A little flour spread over the top of cakes before they are iced will prevent the icing from running off.

Use a little ammonia in the dish water when washing glassware. It will make it sparkle like cut glass.

Sausages should be served with apple sauce or baked tomatoes. Either makes them more easily digested.

When cleaning knives mix a tiny bit of carbonate of soda with the bathbrick and they will polish more easily.

Cereals are seldom overcooked, but rather undercooked. Thus always allow plenty of time in preparing cereals.

SUSPICIOUS.

The Widow (at her washtub, to suitor)—Is yo' sho' yo' lubs me?

Sammy—Co'se I'se sho'.

Widow (suspiciously)—Yo' ain't los' your job, is yo'?—Evening Post.

The Lady—"What, 38 cents a dozen for eggs! Why, that's more than 3 cents for one egg!"

The Grocer—"Well, mum, you must remember that one egg is a whole day's work for one hen."

HOW TO CURE A NERVOUS HEADACHE.

Are you bothered with nervous headaches? Here is one of the simplest yet most effective cures. All that is required is an empty beer bottle or even the rolling pin. Anything will do, in fact, if it is round and hard. Lie down flat upon your back, and place the bottle under the back of the neck, allowing the weight of the head to press down the neck hard against the bottle. Retain this position for five or ten minutes and note how the headache gradually disappears. The pressure cures because it presses down upon two large nerves in the back of the neck, causing them to rest or sleep for the number of minutes the pressure is maintained. This rest allows the nerves to be toned up to normal condition. The treatment is intended for the nervous headache. It will have no effect upon the sick headache, wherein the stomach is the cause.

A SEWING CORNER.

A sewing corner is something that every woman who sews should have. Choose the brightest and sunniest corner in the sitting room, and make it your own little sewing corner. What a lot of trouble it will save you to have all of your materials together when you want to sew. And when you are called out in the kitchen to attend to dinner, you won't have the annoying feeling that your sitting room is a "sight" to behold, should any ne call.

Tack some nails in the wall, within convenient reach of your arm, and hang on them your spools of thread, darning cotton, etc. Above these drive more nails on which to hang your scissors, thimbles, pincushions, etc. Or the opposite side of the wall have another row of nails, on which to hang bags (made of cheese cloth, calico or any material you may choose), in which to keep scraps and odd bits of lace, ribbon, etc. Of course there must also be a large bag to hold the stockings which need mending.

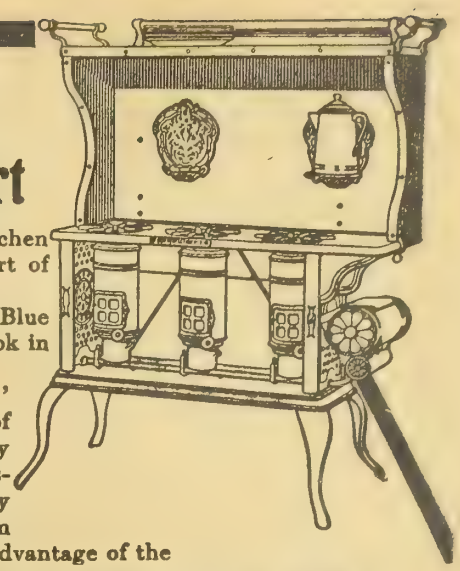
WORRY.

Where work wears out one, worry wears out thousands. There is less happiness among the great than among the poor "But if these limitations could only be removed?" "If I did not have to work so hard?" "If I could be my best self!" "If I could have that for which I know I am fitted!" Ah, greatness of gift always implies greatness of responsibility; if one limitation goes, another comes; that which seems to give freedom only increases slavery. Almost all men, like birds, beat themselves against their cages, longing to get into some different world, to soar beneath some more splendid skies, ignorant of the abysses in that larger world and of the storms which sweep those skies.

Coal Oil Stains.

What will take coal oil stains from carpet?—Subscriber., Bakersfield.

We will ask the readers of the Household Department to give us information as to their experience along this line. However, as one suggestion, a housewife has told us to cover the surface of the stain with chalk, preferably French chalk although the ordinary will do, then lay sheet of brown wrapping paper or blotting paper over it and place hot flat iron on top.



Plan for Summer Comfort

Don't add the heat of a kitchen fire to the sufficient discomfort of hot weather.

Use a New Perfection Wick Blue Flame Oil Cook-Stove and cook in comfort.

With a "New Perfection" Oil Stove the preparation of daily meals, or the big weekly "baking," is done without raising the temperature perceptibly above that of any other room in the house. Another great advantage of the

NEW PERFECTION Wick Blue Flame Oil Cook-Stove

is its handsome CABINET TOP, which gives it every convenience of the modern steel range. Has an ample top shelf for warming plates and keeping cooked food hot, drop shelves for holding small cooking utensils, and is even fitted with racks for towels. Made in three sizes, and can be had with or without Cabinet Top. If not at your dealer's address our nearest agency.

The *Rayo Lamp* gives perfect combustion whether high or low—is therefore free from disagreeable odor and cannot smoke. Safe, convenient, ornamental—the ideal light. If not at your dealer's address our nearest agency.

STANDARD OIL COMPANY (Incorporated)

Mayer HONORBILT SHOES FOR MEN

These splendid men's shoes represent the best there is in shoe leather. Every piece of material is of the choicest tannage. The workmanship is perfect; the styles are up-to-date. When it comes to service, there is nothing that equals them in lasting qualities.

"HONORBILT" SHOES

are everything the name implies. They are *"built on honor."* No matter where you look, or what you pay, you will never find anything that will outclass them in wear, style or comfort.

If your dealer will not supply you, write to us. Look for the *Mayer Trade Mark* on the sole.

FREE—Send us the name of a dealer who *does not* handle Mayer Honorbilt Shoes, and we will send you free, postpaid, a beautiful picture of George Washington, size 15x20.

We also make Leading Lady Shoes, Martha Washington Comfort Shoes, Yerma Cushion Shoes and Special Merit School Shoes.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT. GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT, soft,** steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Hay.

Scott & Magner say under date of April 24: The first car of new hay arrived on the market this morning, and created considerable discussion and attention. Although we have been receiving new alfalfa the last week, still this was the first car of grain hay to come in, and start the movement of the new season's crop. Advices that are received of several thousands tons of new hay that will probably be rushed into market during the next few weeks have practically stopped all tendency to buy, excepting from those who must actually have forage from day to day.

The better grades and choice hay sell readily at quotations below. Quite a feature of the markets for the last two or three weeks has been the arrival of hay from Washington, Arizona, and outlying districts, anxious to take advantage of the extremely high prices prevailing here. With the drop in prices consequent upon the arrival in large quantities of the new crop, these outside shipments must necessarily be discontinued.

The general prospect is apparently of a sudden change in the situation, with early arrivals of the new crop in large quantities. The general impression is that prices will drop back to normal conditions, at several dollars a ton under the present market within the next few weeks.

Citrus Market

LOS ANGELES, Cal., April 28, 1909.

The output of navels is rapidly diminishing and the heavy shipments have caused a material easiness of the market. As several of the heavy packing houses are finishing on navels, it is thought the few remaining will close the season at fair prices. Seedlings and seeds have also shaded slightly and, while this is disappointing to the growers, prices cannot be said to have taken a very heavy slump.

In lemons a satisfactory price pre-

Cream Separators, all sizes, all prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles,

vails and the market is firm. Receipts of foreigns are fairly heavy.

Shipments.

The shipments of oranges since Nov. 1, aggregate 18,148, lemons 2,595; a total citrus shipment of 20,743. Last year at same date oranges 16,840, lemons 2,127, or a total of 18,977.

NEW YORK, April 26.—Sixty-three carloads of oranges and three carloads of lemons sold. Market is very steady on sound stock, but easier on poor and over-ripe stock. Market firm on good stock lemons but poor grades sold off. Weather clear and cool.

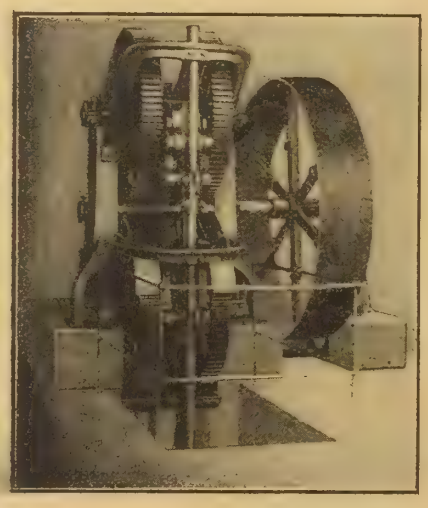
The Smooth Running, Noiseless Pomona Deep Well Pump



It is thirty to fifty per cent more efficient than any centrifugal pump ever made. No high speed bearings to cut out. All breakages and rod troubles eliminated.

This is the only pump you can afford to buy if you consider your own interests. Hundreds of satisfied users testify to this.

Used by the best water companies who know what a good pump is.

Send for a catalog or what is better come to POMONA and let us show you some of these plants in operation.

POMONA MANUFACTURING CO.
POMONA, CALIFORNIA

THE
Latest Deep Well Turbine Pump

Guaranteed to deliver from 100 gallons per minute upwards, depending on the diameter and capacity of well, from a depth of 50 to 300 feet below the surface. Can be either belt driven or direct connected to electric motor as occasion requires.

Write for Catalogue 46B.

A deep well pump that has no valves or plungers to wear or get out of order, no gears, consequently no noise or breaking of teeth.

Compact, durable, always primed and ready to operate, constant flow, hence increased capacity of well.

This type of pump is fast taking the place of Vertical Steam. Deep well Plunger and Propeller Pumps.

"Our Friends the Trees"

From an Address Made at Riverside by
Enos A. Mills of the Forest Service

"NO NATION has ever fallen for having too many trees. But scores of lands have been depopulated and brought to ruin through forest destruction. Most of the great nations of the past have been rich in natural resources, but the one resource most useful to and most used by every nation that built itself to greatness was the forest. The forest is a producer of wood—one of the most useful of materials. The forest is not only a resource within itself but it maintains numerous influences, which enable us better to master and manage the air, the waters and the soil so that these will render us the greatest service and do us the least damage.

"Prof. L. G. Carpenter, probably the world's greatest irrigation engineer, says that forests are absolutely necessary for the interests of irrigated agriculture. Among the many helpful influences of the forest the most important one to the people of Southern California is its water-saving influence. The forest greatly checks the evaporation of water. In this locality the winds have the ability, the capacity to annually evaporate more water than annually falls. Can you realize that on your almost treeless foothills that as high as 80 per cent of the annual precipitation is evaporated by the winds and lost.

"Western winds are extra dry. They are insatiable. The air is constantly absorbing water and the more free movement of the air, the more water it absorbs. A washerwoman places her clothes in the wind in order to dry them quickly. It will be necessary for you to keep the wind away from the water if you want the water yourself. In an open country from 5 to 10 times as much water is evaporated and lost as is evaporated and lost within a forest. The air rests upon the earth and is a thick, invisible blotter that is constantly absorbing water wherever it comes in contact with it. Those areas of the earth, those hills and mountains which lie open and exposed to sun and wind, are most quickly and completely robbed of their moisture. The forest is a shelter, a windbreak. It is ever present, ever defending waters from the wind. So if you want to save the greater portion of the water which nature supplies it would be well to maintain forests upon your water sheds. Is there any better protection for the water supply than the protection which you can give by thoroughly covering your hills and mountains with forests or chaparral?

"Your own John Muir probably is the greatest authority concerning the relation of forest to stream flow and he says that cut down the forests and streams will vanish. The experiences of China, Spain, Greece and Syria, and that of other lands are grim evidence of the fact that forest destruction on a large scale will lead to waterless river channels. At one time millions of acres of land in the countries just mentioned were productive agricultural lands. These lands were watered with streams which rose in forest-covered hills and mountains. The forests were destroyed, the streams vanished and the desert came.

"So great is the influence of the forest in saving the water which the clouds deposit upon the earth that there are numerous instances where a forestation has actually created springs and streams.

"Better forested watersheds would swell and sustain your streams, and give you a larger and more constant supply of water. Water is your greatest resource.

"Forested watersheds will render you another important service. Most of the water which you use for irrigation purposes falls to the earth months before you are ready to use it. Hence it is important to have this water runoff delayed. This is just what the forests will do. Trash accumulates in the forest, but this trash will also cover the ground and keep it loose open and porous, so that the ground will quickly absorb water. Hence this accumulation of trash, which the forest provides, together with the countless tree roots which penetrate and perforate the earth, literally conducts much of the water quickly into the earth where it cannot be evaporated. Once the water is into the earth it must seep slowly away. Its passage through the earth being slow, its runoff is thus delayed."

ONE USE FOR A PICKET FENCE

TRUE Sharples MARK 29 Yrs

THIS picture shows how one woman used her picket fence to dry the disks from her "bucket bowl" cream separator. She realized the need for using a separator and the work of thoroughly washing a half bushel of disks twice a day, but she did **not** know that the simple Sharples Dairy Tubular would have **saved** her that work and given **better** service, or she **never** would have let her husband buy a disk machine.

The simple, light Sharples Dairy Tubular bowl is easily washed clean in 3 minutes. A few thrusts of the brush does it. Better than spending 15 to 30 minutes washing a "bucket bowl."

Two Wrongs Don't Make a Right

"Bucket bowl" manufacturers are **wrong,** in the first place, in using wide mouth, squatty, "bucket bowls" fed through the top. That kind of bowl is **not** modern. They are **wrong,** again, in filling their bowls with disks or other contraptions, for such parts do not make a steady, simple, light, easy to clean, durable bowl. These two **wrongs** don't make "bucket bowl" separators **desirable** or **right.**

The **only modern** bowl is the light, slender, simple Dairy Tubular bowl, hung below its bearing and fed through the lower end. Our patents prevent imitation, so others still make "bucket bowls" out of date years ago.

Anyone can build disk separators cheap, and build them like the "old original" disk machine. The maker of this "old original" is advertising a suit against a catalog house machine that has been built like his for a number of years. Has he just discovered that other disk machines are like his? Or has he discovered what is still worse for him—that farmers who want to try a disk machine are buying cheap ones, so they won't lose so much when they replace them with Tubulars?

Disgusted farmers are trading in to us, for Tubulars, car loads of "bucket bowl" separators—new as well as old. Not a pleasant experience for them. **Avoid** it by getting a Tubular. Tubulars are made in the world's greatest separator factory. Branch factories in Canada and Germany. 1908 sales way ahead of 1907—out of sight of most, if not all, competitors combined. 1909 better yet. Get catalog No. 260.

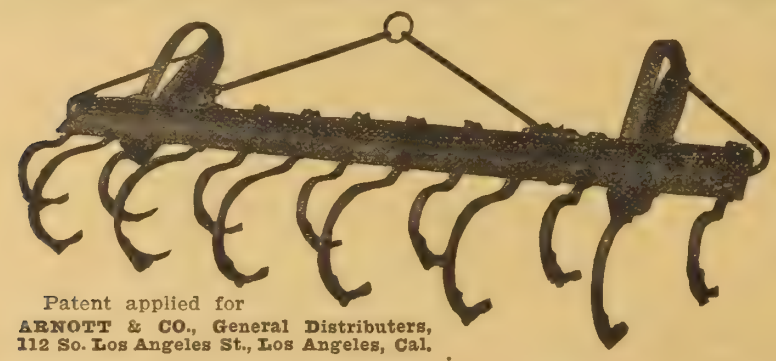
WILLIAMS' GOOSE-NECK CULTIVATOR



Patent applied for
ARNOTT & CO., General Distributers,
112 So. Los Angeles St., Los Angeles, Cal.

Especially adapted for citrus orchards. Sizes 7 to 14 ft. Lightest draft. Write today

The following is a sample of the unsolicited testimonials received regarding the Williams Goose-Neck Cultivator:

Merle, San Diego County, Cal., March 25, 1909.

Arnott & Company,
Los Angeles, California.

Dear Sirs:—You may recall that I recently purchased one of your Williams Goose-Neck Cultivators. I wish to say that I am exceedingly well pleased with it. In fact, as I told Mr. Jones, your representative in Oceanside, I would not take $500.00 for it if I could not get another. This is not an exaggerated statement, I mean it literally. In this section we do not have irrigation and everything depends on proper cultivation, so that good tools are very important. There are three points in which the Williams Goose-Neck Cultivator surpasses all other cultivators which I have seen, viz:

First. The draft is very light. My two horses weigh 900 lbs. each and they have no difficulty in drawing the 7 ft. cultivator.

Second. The Williams Goose-Neck Cultivator stirs the soil well without exposing the subsurface, thus preventing the escape of moisture.

Third. The cultivator being of low construction, one can cultivate under the trees as easily as harrow.

I was showing my cultivator to a neighbor the other day and had him take it home to try it. The use of it for half an hour so thoroughly convinced him of the merits of the tool that he has, through Mr. Jones of Oceanside, given you an order for one-half dozen cultivators.

Messrs. Williams & Son of Orange certainly deserve great credit for inventing the Goose-Neck Cultivator.

Sincerely yours

LOUIS C. LUHR.

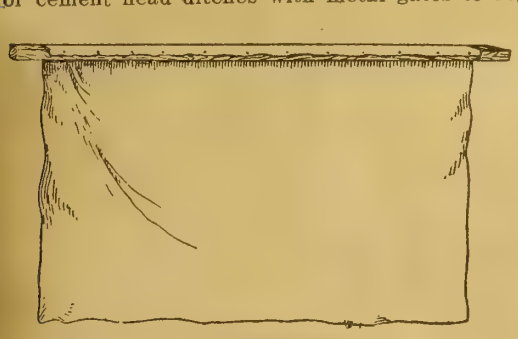
Practical Irrigation by Practical Men

A Series of Letters from Orchard Irrigators which are Filled with a Fund of Information

IT HAS been claimed and is probably true that California has reduced the handling of water in irrigation the nearest to a science of any section in the world. This has been true in part because of the returns given for intelligent handling of water have been such that it has brought some of the brightest men of the country to this state to aid in solving its agricultural problems; also in part because of scarcity and high price of water. The time was, but a few years ago, when orchardists turned into small furrows large heads of water which escaped with much of the soil and fertilizer at the lower end and often running down the street or "wash." Such cases are seldom seen now. In some sections, however, where water is still plentiful in proportion to the amount of land which it covers, it is conducted over sandy wastes in open canals, losing sometimes over half of its original quantity by seepage. In the southern end of the state, however, the land has been settled so thickly that the water is fully appropriated and used and the cry already is "How may we secure more water?" There, as a rule, water is conducted in buried pipes or in open cement lined ditches. Then orchards, as a rule, are provided with pipe or cement head ditches with metal gates to regulate the flow into the orchard furrow under perfect control of the irrigator. This control is usually so complete that not a drop escapes from the lower ends of the furrows.



The cloth dam.

Convenient in soft dirt head ditch where it is desired to let part of water escape, also when necessary to change course of water.

Wishing the most reliable information as to the method followed in handling this water in the orchard, the Cultivator recently sent a number of subscribers a series of questions asking methods of work. The questions were as follows:

1. Do you irrigate by the furrow or the basin system?
2. If furrow, do you believe in the deep or shallow furrow?
3. Have you ever used a sub-soiler to loosen soil to allow of better penetration?
4. How deep do you consider it necessary to have the soil saturated? How long is it necessary for the water to run in order to give thorough saturation? What is the nature of your soil and have you ever investigated as to how deep the water penetrates after the usual run?
5. What length should the furrows be on ordinarily level land to get best and most even depth of saturation?
6. If furrow system, how do you handle the waste water, or rather how do you prevent wasting of the water at the lower end and do you feel that your lower trees receive sufficient quantity compared with the upper end?
7. If a basin system is used how do you handle the soil? Do you find more difficulty in reducing to a perfect mulch than by furrows?
8. How soon after irrigation do you do your first cultivating, and what are the methods and implements employed?
9. Do you follow within a day or two with other cultivation or disking and do you finally leave the soil as cultivated, or do you "smooth?"
10. After the final cultivation, do you cultivate again before the next irrigation?
11. How long before the next irrigation, or how many times during the season do you irrigate?

In reply to the above questions we have the following:

Some of the writers reply by using the question number, and others treating it in a more conversational way. The answers are so plain and give methods in different sections of the state in a way which calls for no further comment.

* * *

Charles C. Chapman, Fullerton, Orange County.

1. By the furrow system.
2. In deep furrow.
3. I have.
4. Three or four feet. The length of time necessary for the water to run depends very largely upon the character of the soil. Light soil water will penetrate more quickly. I have various kinds of soil. As the season advances the water does not penetrate as deep as it does early in the season.
5. Four hundred to five hundred feet, although I use some over six hundred feet.
6. Some places I use the basins around the last three rows to hold waste water. Other places I am able to carry it on into the walnut orchard.
7. We use a lister to break down ridges followed by a spring tooth harrow. We are able to reduce these to a mulch as thoroughly as by the furrow system.
8. It depends upon the character of the soil. From two to four days. We first use a spring tooth harrow, afterwards a cultivator.
9. Follow with cultivator within a few days. We find the disk a valuable implement. We do not make any special effort to make the soil "smooth."
10. Yes.
11. From six to ten or eleven weeks. Three and four times.

* * *

A. G. Schulz, Porterville, Tulare County.

All of our irrigation here is done on the furrow system, and as a general thing I believe everyone here is in favor of deep furrowing, we want to get the water down to the roots.

A few years ago quite a few orchardists in this section used sub-soilers, but lately there has been no sub-soiling done here. Why the practice has been discontinued I do not know. Personally I have never used a sub-soiler, as I was afraid of injuring the root too much.

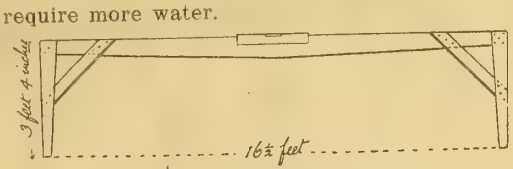
We try to furrow at different depths for each irrigation, using a shallow furrow earlier in the season, and working deeper as the season advances. In this way we think that we can prevent a plow-sole from forming, and get our water deeper into the soil when it is needed there.

The only soil that I have had any experience with is adobe, and the best results are obtained when water is run in furrows not over 300 feet in length, for the distance, if the land is comparatively level it will take about three days to saturate the soil in good shape. I have never investigated how deep the water will eventually penetrate, but it will reach quite a little below the bottom of the furrow by the time the water is shut off.

We generally use inch outlets for each furrow, and open them to about one-third at the beginning of the irrigation, as the water advances we increase the flow, until when the end of the furrow is reached we generally use the full flow of the opening, and hold it there for a short time by banking it back, but if the water has been handled carefully we find that this is not necessary, as by this time the land will all be quite well saturated.

It depends of course on the season of the year, how soon after the water is turned off before we begin to cultivate, on an average I should say about the third day, at any rate as soon as the soil can be worked without clodding. I generally first close the furrows with a revolving harrow, and then follow with a chisel-tooth cultivator, then follow this again with the revolving harrow in order to smooth the land better, and keep the water from evaporating.

In the older orchards we find that four irrigations are generally enough, but the younger trees require more water.



Homemade leveling device.

If the variation in a level constructed as above is ⅛ inch, that indicates 4 ft. fall per mile. ¼ inch indicates 6 ft.; 5-16 inch 8 ft. and ⅜ inch 10 ft. per mile. It is a handy tool for the irrigator.

* * *

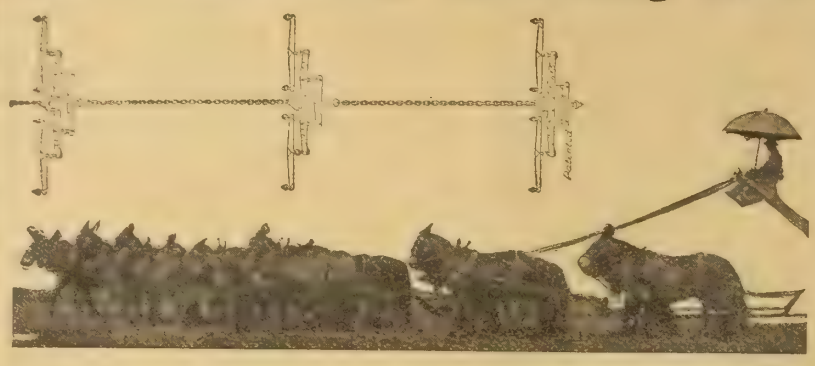
R. C. Allen Bonita, San Diego County.

I will take up the questions in order:

1. Furrow System.
2. Deep furrows.
3. Have used subsoiler at times to break up plow sole, but only as occasion seemed to require it—never as a regular part of irrigation system.
4. Soil should be saturated well below the root system of the trees—at least three or four feet. The length of time necessary to accomplish this will depend on kind of soil and the state of tilth. Our soil is mainly red mesa land with clay subsoil—part is black adobe mesa soil. There are great variations in soil and we have to adapt our methods to the differing conditions.
5. About 400 feet.
6. We irrigate from a pressure system with water always at command. We allow just such a stream to run as will reach the lower end of the furrow and block it off to hold it back. We keep this stream running for four or five days or until the soil appears to be thoroughly saturated. We feel, however, that the lower half of the furrow does not receive as satisfactory an irrigation as the upper.
8. As soon as the soil will cultivate into a mealy consistency. We use ordinarily a four horse Monarch cultivator, leaving the soil as cultivated. Our trees are planted in triangles and we go over the orchard three ways.
10. We cultivate again midway between irrigations.

(Continued on Page 536.)

The Schandoney Equalizing Hitch



for the Combined Harvesters, Plows, Harrows and any other team work

Your team will walk from two to four miles further per day and do it easier without uging, when using this Hitch. Your slow, lazy animals will surprise you when hitched to this EQUALIZING HITCH. Write us today for further information, Catalogue, etc.

All About the Orange and Lemon

Is told in our new book on Citrus Culture, embracing every phase of the subject from the seedling plant to the final disposition of the fruit in the Eastern market. The largest and best book on the subject ever printed—60,000 words, 100 illustrations. You will want a copy, which we will send you for the small sum of 25 cents. Remember we are the largest growers of orange and lemon trees in the world.

Supervisors of Glenn county have appointed M. Jenson live stock inspector.

With the Citrus Growers

DISPOSING OF OUR ORANGES.

THE Riverside People are always up-to-date in things pertaining to the orange and its growing and marketing. One of the steps of maintaining that position which they have taken during the past season has been a course of lectures given at the Y. M. C. A. rooms. At the last one of these meetings an address was delivered by Mr. C. C. Chapman of Fullerton and from it we quote:

"It is one thing to grow the orange, and another thing to market it profitably. The fruit must be presented in a shape to appeal to the buyer. With the transportation facilities that have been provided by the railroads, we ought to be able to do this.

"In Southern California we have some of the finest specimens of citrus fruit grown in the world. Ours is a hardy fruit, and it is plainly up to the shipper to market it properly. The solution of this problem lies in looking after all the details of the process of handling in a sensible manner. Not one step may be slighted without paying the penalty.

"We have reached a point in the system of packing adopted where we don't expect to see many more radical changes made. In fact, there is little that is new that is to be told the growers, and conferences of the kind such as we are enjoying tonight are valuable more particularly for the inspiration that is to be gained than anything else.

"About six years ago there was inaugurated an era of education in the art of handling oranges. As a result, the industry is on as safe, sound and permanent a basis as any other agricultural industry. The most important factor in this development has been the work conducted by Mr. Powell.

"One of his discoveries was the fact that the fruit we produce will, if not mechanically injured, keep for several weeks, enabling us to ship at any season of the year. The difficulty, however, is to prevent the injury of fruit and keep such fruit out of the pack. It is next to impossible to get the class of help that will see to this matter properly, regardless of the fact the growers would gladly pay adequately for it.

"One of the first important points in handling the crop is a familiarity with the orchard. Orchards have their weak spots and the grower should have knowledge of these. Although the best fruit produced in the world, the orange may easily be made a cull. It must have care all along the line. Picking is a trade by itself. The right kind of clippers must be used and they should have careful attention. As the result of the recent experiments, clipper cuts and long stems have practically disappeared.

"A good ladder is essential to good work. It must be light, one on which it is comfortable to work, and it should be long enough to reach above the tree, to guard against injuring the top. In Riverside, where nearly all of the fruit appliances have been invented, a well-nigh perfect ladder is manufactured.

"The picking bags should be of the proper size and kept in good condition. The method employed in emptying the bags into the picking boxes is an important point and should be carefully watched. A regularly prepared picking box only should be used in the field. It is an insult to the trade to offer fruit in a packing box that has been soiled in the orchard.

"With regard to loading and hauling only wagons with springs should be used, and only low wagons should be permitted in the orchard. The fruit should not be allowed to stand long in the sun, as the tendency to decay is thereby greatly augmented.

"The fruit should be watched most closely in the packing house. A cut, punctured or bruised orange is a serious detriment, and it is cheaper to throw it away here than to pay freight on it and have the disgusted buyer pick out the decayed fruit at the other end of the line. It is poor business policy to ship a bruised orange.

"As to shipping, navels should be sent out soon after picking. The Valencia, on the other hand, is in better condition to pack after standing for four or five days. If not damaged Valencias will not decay for months.

"If it is thought necessary to wash fruit, it should be done as soon as it is brought into the house. In my own case, I always use the brusher to brighten up the fruit, but it must be watched carefully to guard against any injury.

"Consistent grading is an important point. I endeavor to grade my fruit so that every car will be as nearly alike in quality as possible. A uniform size is also essential. We should furnish a pack in which the trade will not be disappointed. You can't build up a reputation for a brand unless you have a care with regard to these points.

"Endeavor to secure a good, sound, solid pack without crowding too much fruit into the box.

"Nothing so demoralizes the market as decayed fruit. The precooling of fruit is going to prove one of the most scientific methods of shipping that has ever been tried.

"Lastly, we should observe care in our methods of handling our fruit, not merely because of the returns, but for the satisfaction we can get out of it as well. It is a small man who does not enjoy doing an honest piece of work. It is our privilege to get out of our business, which is the most delightful occupation in the world, a degree of pleasure that is a far more satisfying recompense than the financial returns that follow as a matter of course."

TO MAKE A GOOD CITRUS GROVE.

A Valencia grove at Lindsay having made a wonderful record, inquiry was made of its owner as to methods of fertilization and culture. The owner, Mr. C. O. Cowles replied:

As to fertilizers, up to last year it has had a ton of commercial fertilizers, per acre each year. Last year this was changed to half ton of commercial fertilizer per acre and a dressing of barn yard manure in addition to a cover crop of vetch plowed in the spring. The grove has been plowed well each way, that is, plowed and cross-plowed each spring; irrigated about once a month during the dry season and well cultivated after each irrigation, and has never been fumigated or sprayed, there being no scale or red spider in this district, fumigation and spraying are unnecessary here.

There is likewise no secret in the

pruning this grove has received. Each spring I have removed the dead wood inside the heads of the trees as well as all suckers which may have appeared. I have sent men through the grove three times each summer and had them rub off the suckers which have started while they are still very soft and brittle, leaving very few to be removed at the regular spring pruning.

There is certainly no secret or other method of caring for an orange grove which can compensate for or take the place of the natural condition of the soil, climate and topography so essential to the highest degree of perfection in citrus, and it is to the natural conditions prevailing here to which the greater part of the success of this grove is to be attributed, as is evidenced by the fact that the returns from the grove under discussion are little, if any more than the average received from other Valencia groves of the same age in this district, the returns from some of which having been larger than I received from mine. Briefly the main thing is to locate your grove where the natural conditions are the most favorable, for it is there that care, cultivation, fertilization and judicial management may be made to count for the most, and no amount of these can compensate for the absence of these favorable natural conditions. Where nature has given us proper conditions and environments we can aid her by doing our part, but where these conditions are unfavorable we cannot expect the best results—no matter how hard or how carefully we may try.

BLACK SCALE.

At this season of the year we find on the citrus trees only young black scale. The last eggs were hatched out before November and only the hollow shell of the mothers remain. But on the roots of night-shade, (Solanum douglasii) we find a different state of affairs. This may furnish a ready and constant supply of scale in all orchards not free from this plant. Fumigation will not kill the scale because of their position beneath the surface of the soil, and in no case have I found a scale in the ground parasitized by the Scutellista. They apparently do not attack these root forms, so that control of the Black Scale by this insect is impossible so long as night-shade is allowed to grow under the orange and lemon trees. The farmers have evidently failed to realize the importance of this fact, for night-shade is plentiful in and about every orchard. Even in the best-kept orchards the plants are not uprooted, but cut off near the surface. In such cases new sprouts are continually appearing, furnishing a direct communication between the uninjured scale on the roots and the lower branches of the trees. Thus the scale propagates on the roots regardless of any amount of fumigation and supplies new broods for the orchards, due to the protection of the soil and the breeding continues throughout the winter as well as in the summer.

Not only is Black Scale found on the night-shade, but upon many other plants in the gardens, and especially in the rocky waste places or "washes" near many of the citrus groves. It is to the last condition which I wish to refer and particularly to the Rhus or Sumac which grows abundantly in all of these waste places. One need not examine closely to find Black Scale upon this plant at great distances from the citrus groves and often in great abundance. Sumac should not be allowed to grow near an orchard because it serves as constant breeding places for scale, and it is in one sense useless to fumigate an orchard so surrounded without also fumigating or destroying the Sumac growing near by.—E. O. Essig of Claremont in Journal of Entomology.

BLACK SCALE ON ROOTS OF NIGHT SHADE.

Or, as the bug specialist would say, "Saissetia olea on the roots of Solanum douglasii." Either way it is put the bug on that weed is a bad combination. The grower should get busy and uproot the night shade at once. Read Mr. Essig's article.

State wide crusade against the white fly should be instituted before our orange groves are devastated by this pest. A state commission should be appointed with power to enforce fumigation, and the use of the fungi that feed upon the larvae, and to cut down and utterly destroy every tree and plant in the state that is a source of infection.—Florida Fruit and Produce News.

Tulare county shipment of oranges to date aggregate 748,461 boxes, or about 1949 cars. Valencia and a very few of the navels are yet to go. Last year's total was 3150 cars up to November 1st.

The Riverside Groves & Water Co. has secured a deep well drilling outfit, which will go through granite, with which they hope to secure more satisfactory wells.

The Gregory Fruit Co. will build a raisin seeder at Colton.

LARGEST VEHICLE FACTORY IN THE WORLD

The Ornamental Garden

THIS MONTH.

THE lawn is susceptible to wonderful improvements at this time of the year and a good dressing of bone dust or superphosphate will prove advantageous. At this time of the year the bermuda grass is doing its meanest and a thorough combing with a sharp garden rake helps to prevent its spread. The cool days of the last two weeks have been exceptionally favorable for starting a new lawn and a better time cannot be chosen. When weather as favorable as this can be had it is very satisfactory to start without mulch dressing which is often desirable, but where no mulch is used over the surface to protect the seeds from the direct rays of the sun, one must use great care to sprinkle lightly two or three times each day and in extra warm weather still oftener.

In the flower garden sow primula, calcoelaria or reset plants which have come from former sowings. Plant chrysanthemums which are now well rooted, also petunia, balsam, zenias, coleous and also plant the amaryllis, agapanthus, dahlia and hollyhock. Canna roots may be divided and reset. Manure the ground heavily and keep the garden thoroughly wet and cultivated.

SALVIAS.

These plants are the most showy bedding flowers in cultivation, a bed of them surpassing the finest scarlet geraniums in brilliancy and continuous bloom. From the time they first begin to flower the plants are never out of bloom until cut down by frost. They are easily grown by following a few simple instructions: Start the seed indoors or in a hotbed early in March. Keep the soil warm and moist until the plants appear, which sometimes requires three weeks. When the second leaves appear transplant so as to stand three inches apart each way set in rich soil three feet apart each way. Keep the soil fine and loose at all times during the growing period. The latter rule may well be applied to growing all varieties of flowers.

Be sure and put the home garden in good shape before planting.

Small Fruits and Vegetables

THIS MONTH.

THIS is one of the best months for pushing the garden and in fact later green stuff for the table depends much upon culture at this time. It must be borne in mind that vegetables growing as they are at this season of the year require a great deal of water. One of the best ways of supplying water for the use of the growing plant is to conserve it, that which is already in the soil, by thorough tillage. Mulching also is most valuable for as the days get longer and the sun stronger it robs much moisture.

Cut worms will be a factor or may be now. In fact some growers have already entered their protests against the work of this little pest. Spray with paris green or arsenic and if the garden is small it may be protected to a certain extent by having furrows with straight sides entirely around it. Use great care to destroy every one which may be found near the roots of the plants. Turn over clods and kill all you find.

For future sow peas, sweetcorn, squash, pumpkins, cucumbers, okra, beets, carrots, lettuce, raddish, turnips, parsley, beans, spinach and in fact nearly all things needed for the summer garden. Cabbage, and tomato plants may be reset, also onions, asparagus, horseradish and rhubarb. After setting the plants, be sure they have an abundance of water to settle the finer particles of soil around the roots. If the setting should be followed by warm weather it may be well to protect from the direct rays of the sun for a few days. If only a few are to be planted, one may well choose the evening or later afternoon. Many feel that this is the preferable time of the day for resetting plants.

TO GROW SWEET POTATO PLANTS.

Prepare a hotbed by using fresh manure from the horse barns. Add about one-third to one-half straw or bedding material and mix thoroughly. This mixture should be packed in the bed to a depth of twelve to eighteen inches. A convenient width for a hotbed is six feet; they can then be made as long as desired. The mixture should then be thoroughly moistened but not made wet; too much water will retard the heating process caused by the fermentation of the manure. Let this mixture stand in the bed for three or four days, by which time it will have reached its highest degree of heat.

At this time the bed should be carefully examined to see that there are no dry spots. The mixture should be kept well moistened. The frames that are to support the covering of the bed should then be placed on top of the bed of manure with the slope of the top to the south. Two or three inches of soil should be spread over the mixture and the sweet potatoes carefully placed on the surface and covered with an additional layer of soil to a depth of two or three inches. Sandy soil is best for this purpose. Keep this soil moist throughout the entire period of plant growth.

The potatoes should be carefully distributed over the bed and no two potatoes should lie against each other, but they need not be more than one-half inch apart.

Potatoes that are more than two and one-half or three inches in diameter should be split lengthwise, and the cut surface placed down in the bed; smaller potatoes may be placed in the bed whole.

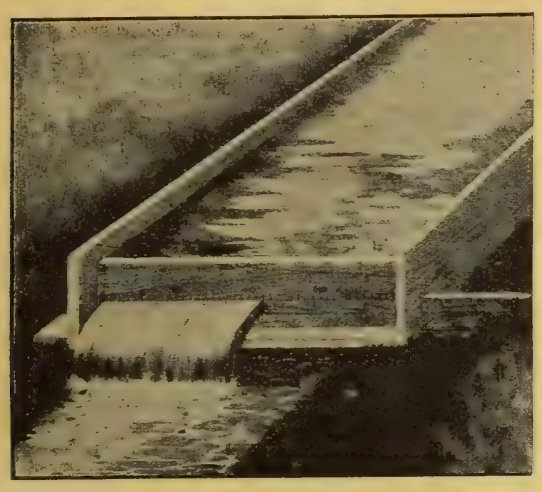
The plants should be placed in the bed about six weeks before the first plants are to be transplanted to the open field. If care is exercised in pulling the plants, a second crop of plants and a third and much lighter crop will be produced about two weeks later, during which time a good bed will produce from 100 to 150 plants per square foot.

The plants should not be placed in the open field until the soil is quite warm and all danger of frost is passed.

Measuring Water

To Measure an Inch.

For that measurement a box should be constructed, at more or less expense, with an opening made variable as to length, by a sliding stop, as shown in the cut of "A Miners' Inch Measuring Box." The lower edge of the aperture shown in the cut should be two inches above the bottom



A Miner's Inch Measuring Box.

of the measuring box and the plank five inches high above the aperture, thus making a six-inch head above the center of the stream. Each square inch of this opening represents a miner's inch, which is equal to a flow of one and one-half cubic feet per minute.

Wier Measurement.

This convenience, however, is seldom at hand, so we also give a cut illustrating the "Wier Dam Measurement," which is so simple that any one may construct and get at least a general idea of the amount of water flowing in a stream.

The miner's inch here is usually figured on the basis of four-inch pressure.

The wier should be so placed that the water passing over it should be in effect a discharge from the still water of a reservoir and shall not be in the least affected by the velocity of the current flowing into the reservoir or wier box. This velocity of an inflowing current, if noticeable at the wier, becomes a "velocity of approach," which will render inaccurate the desired measurement. This "velocity of approach" may be obviated by placing one or more lattice screens made of laths or other similar construction between the wier and the inlet.

The length of notch should be at least four times its depth for small quantities, and longer for large quantities. In addition to the above, for accurate measurements it is advisable, if possible, to also have the length of the notch about two-thirds of the width of the water on the up-stream side; it may be necessary to experiment somewhat in order to obtain this condition.

The overfall, or vertical distance, the water fall on the down-stream side, should be about twice its depth—that is, 12 inches if the notch is six inches deep, and so on.

In the pond not less than three feet, and preferably six feet from the wier and to one side so as to avoid any current, drive a stake, with its tops precisely level with the bottom of the notch in the wier; then measure carefully with a rule the depth of water over the top of the stake. This will give the theoretical depth of flow.

The two tables given on this page may be used to determine either the number of miner's inches or the number of cubic feet per minute.

The wier table is based on zero velocity of approach. Where the velocity of the stream is considerable, the following correction must be added to the measured depth in order to compensate for this velocity of approach:

½	ft. per second	1-16 inch
1	ft. per second	¼ inch
1½	ft. per second	⅝ inch
2	ft. per second	1⅛ inch

TABLE FOR WIER MEASUREMENT.

Giving Cubic Feet of Water per Minute, that will Flow Over a Wier One Inch Wide and From ⅛ to 18⅞ Inches Deep.

INCHES	⅛	¼	⅜	½	⅝	¾	⅞
0	.00	.01	.05	.09	.14	.19	.26	.32

Suppose the wier to be 66 inches long, and the depth of water on it to be 11⅝ inches. Follow down the left hand column of these figures in the table until you come to 11 inches. Then run across the table on a line with the 11, until under ⅝ on top line, and you will find 15.85. This multiplied by 66, the length of the wier, gives 1046.10, the number of cubic feet of water passing per minute.

Table of wier measurement giving miner's inches:

1	2	1	2	1	2	1	2
⅛	.01	3⅞	2.56	7⅝	7.04	12¾	15.27

Wier Dam Measurement.

For instance: If the rule indicates a depth of three and one-eight inches of water, turn to column No. 1 for three and one-eight inches. Opposite it in column No. 2 is 1.86, which means that for every inch of the wier there is flowing 1.86 inches. If the wier is 36 inches long: 36x1.86—66.96 miners' inches over the wier.

An Ideal Sheep Pasture in the Mountains.

Deciduous Fruit Culture

By J. W. Mills

SHALL WE CONTINUE TO SPRAY FOR CODLING MOTH?

MR. W. P. HEADDEN, in Bulletin No. 131, of the Colorado Experiment Station, has given most conclusive evidence that many apple trees that have been heavily sprayed for years with arsenical poisons are in a sick and dying condition, or are already dead.

This malady has been going under the names, "collar rot," "crown rot," and "root rot," without any well founded assignable cause. There have been several theories as to the possible cause, such as seepage, alkali, and disease organisms. The first two of these troubles are probably one and the same, namely, too much water in the soil, and no one has been able to assign the trouble to a definite micro-organism. It should be remembered, also, that Doctor Headden's experiments have nothing to do with trees that died from drowning; and the writer knows, personally, that many, at least, of the samples of trees analyzed were from land where seepage conditions are absolutely unknown.

Doctor Headden's discovery of the real cause of this trouble has come, we believe, in time to prevent very extensive losses from the death of orchard trees in this manner. It will be folly, however, for any one hereafter to spray his orchard with arsenical preparations more times or in greater strength than is absolutely necessary to get good results.

Personally, I very much regret, as does Doctor Headden, that arsenical spraying is resulting disastriously to any of our orchard trees; but it is worse than useless to evade facts, and I am thoroughly convinced that Doctor Headden has been very conservative in his conclusions as to the extent of damage that has already been done to apple and pear trees where excessive arsenical spraying has been carried on.

Symptoms of Arsenical Poisoning.

The symptoms, in a rather advanced stage of this disease, as described by Doctor Headden and Mr. Whipple, are about as follows. Trees usually stunted in growth; bark very yellow; bark often dead and black just below the surface of the ground; the main roots in a similar condition; leaves yellow and maturing early; apples very abundant, but small and highly colored; the bark of the trunk and main limbs often with vertical cracks which may or may not give out an exudation. Trees strongly exhibiting the above condition one year are almost sure to be dead the next year.

This trouble usually appears first upon a few scattered trees, and from year to year seems to spread to others. In any orchard where a few trees are found in the above condition the utmost caution is necessary in spraying with arsenical mixtures for the codling moth or other insect pests.

How to Spray.

Since coming to Colorado, more than eighteen years ago, the writer has steadily urged the fruit growers of the State to depend chiefly upon a thorough treatment or two just after the blossoms fall, and has advised not more than one late treatment. While this has now become a very general rule among Colorado apple growers, there are still many who think if two or three sprayings are good, more will be better, and it is in the orchards that have been sprayed four or five times or more each season that most of the mischief has been done.

Now, instead of recommending two or three applications for the codling moth, I am fully persuaded that it is best to recommend one, or at most, two.

If an orchard has a few trees that show the characteristic symptoms of poisoning, as given above, or if the trees have been heavily sprayed for several years, I would recommend one spray only just as the blossoms are about ninety per cent off. If the trees have not been excessively sprayed, and if for any reason the first application was not very satisfactory, it might be advisable to make a second application, from four weeks to thirty days later, which will be the time for the eggs of the first brood to begin to hatch well.

Arsenate of lead is by odds the best poison to use, as it is least soluble in water.

We have been recommending from three to five pounds of the poison to each 100 gallons of water; but since Professor Melander has demonstrated that two pounds to 100 gallons are sufficient for the best results in Washington state, I believe it is advisable to recommend two, or not more than three pounds, to each 100 gallons of spray, for Colorado. Add no lime to the mixture.

Some Precautions.

Use a fine spray, with good force (150 to 200 pounds pressure), as a given quantity of spray material will go further in this way and give better results.

The amount of material used can also be economized by spraying the upper portion of the trees from a tower, so as to direct the spray downwards into the calyx cups.

Avoid spraying the trunks and large limbs, so as to cause the liquid to run down and collect about the crown of the tree.

If much of the spray does collect about the crown of the tree, or if the trees have received repeated heavy sprays in former years, it would be well to follow Doctor Headden's advice to remove the poisoned dirt from about the crowns and replace it with fresh dirt from between the rows.

Avoid using strong alkaline water for the spray tank, as it will dissolve some of the poison and increase the danger of arsenical poisoning.

In orchards already suffering severely from arsenical poisoning, it might be advisable to abandon the spray for a time and depend upon bands and the prompt destruction of all wormy fruit to keep the worms in check.—C. P. Gillette.

IRRIGATION PRACTICES.

(Continued from Page 531.)

11. We irrigate three or four times according to the season. Also in the winter if rains fail. As we irrigate from a pressure system we can allow the water to run as long as we choose and believe that by running small streams a long time we accomplish better penetration than would be possible with larger streams and more rapid work.

* * *

D. Frank Southworth, Banning, Riverside County.

1. Furrow system.
2. Deep furrows.
3. Never used sub-soiler.
4. To depth of tree roots at least. Length of run varies on different soils. Soil is light clay loam. Have not investigated depth of water thoroughly enough.
5. Don't know. Our land has heavy, fall and furrow are from 630 feet to 1250 feet long.
6. Run small streams so very little water run off. Lower trees seem to do fully as well as any.
7. Know nothing about it.
8. Fill furrows from 24 to 48 hours after water is shut off. Cultivator.
9. Follow in short time with cultivator or harrow. Usually smooth with harrow.
10. Usually run harrow between irrigations.
11. Usually irrigate three times during season.

* * *

Charles J. Dreher, Oroville, Butte County.

1. Furrow System.
2. Deep furrows.
3. We use sub-soiler during the later part of the summer, but only to a sufficient depth to break crust formed just below the mulch.
4. In the grove under my charge, we run the water from 48 to 72 hours to give thorough saturation. The nature of our soil is rather clayey which takes water rather slowly. We have never investigated as to how deep the water penetrates.
5. Length of furrow depends on the character of the soil. In our soil I should say from 500 to 1000 feet.
6. We cannot prevent waste water at lower end of furrows. With proper handling only a very small amount is lost. Our lower trees receive sufficient water.

8. We use disk harrow to go over ground after irrigation and do this as soon as the ground is dry enough to work. Usually 24 to 48 hours after irrigation.

9. We follow in one or two days with deep cultivation and leave the soil as cultivated.

10. Usually cultivate again from two to three weeks after irrigation.

11. We irrigate every five or six weeks from May to October 1st. The

We made our basins large and deep by plowing two furrows together running east and west if the fall is to the south and west. We would irrigate as close to the trees as a team could walk without injuring the fruit. I prefer the plow to the ridger, however, we used the ridger twice in each row north and south to make the side of the basins and a ditch in which the water might run.

I find it a good plan to use strips

Used in closing openings in basin system of irrigating.

answers as given relate to handling groves planted in the red foothill soil carrying considerable iron and clay. Naturally the handling of this soil must differ from that of a sandy or granite loam.

* * *

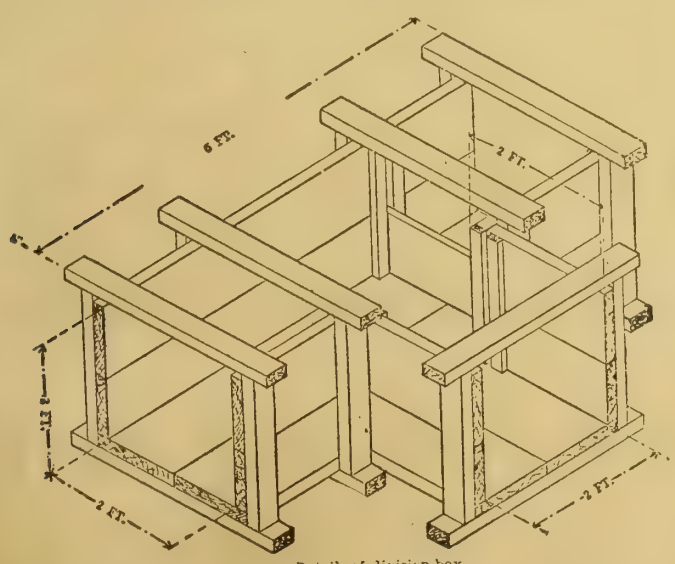
H. E. Gulvin, Hilmar Colony, Turlock, Stanislaus County.

My experience is largely in the southern end of the state where I spent fifteen years in the orange orchards. They still have a charm for me, but I now have learned to love the alfalfa fields of Turlock, also the peaches and apricots which grow to perfection. Now, as to irrigation, I give you the following from my fifteen years experience in Glendale, Los Angeles county, where water was scarce and we had to make every drop go where it would do the most good.

of canvas to lay in this ditch to save the water and save washing of the soil, that is about one-fourth of the way from the head ditch, or still better is canvas hose put together in 20 foot lengths then if trees are 20 feet apart sections may be taken off as each basin is filled.

I think head ditches should be at least 20 rods apart then run from the ditch to lower end and fill lower basin first, working back to head ditch and filling each basin from the upper side. The amount of water in each basin must be sufficient to soak down to reach former moisture.

Surface irrigation is useless or even worse, for water must go as deep as the roots or they will form on the surface, which is not the right place for them as they are destroyed by the cultivator. I cultivate the first day



Details of division box.

A division box like the above is well worth its cost especially in soft ground which washes badly.

I tried the furrow system, but found the soil was too porous, being a decomposed granite and taking the water so readily that it was no easy matter to give a uniform wetting. The upper part of the orchard would become saturated very deeply but the lower end would not be reached at all. On clay or heavy soil it would be entirely different. There I think the furrow system would be decidedly best, especially if the water supply is abundant. In the orchard with shortage of water, I find the loose granite soil is vastly better in the basin system of irrigation.

after irrigation or not later than two days and follow the cultivator with the harrow, working well under the trees. After three weeks cultivate again and that will give lots of mulch or loose soil to work up again in the basin at the next irrigation.

The next irrigation should be about five or six weeks after the first and must be done thoroughly each time. Little and often is a poor policy in irrigation.

Here in Turlock we have an abundance of water and so do not have to be so careful. When we prepare land to seed to alfalfa we ridge it up in

Harrow While You Plow

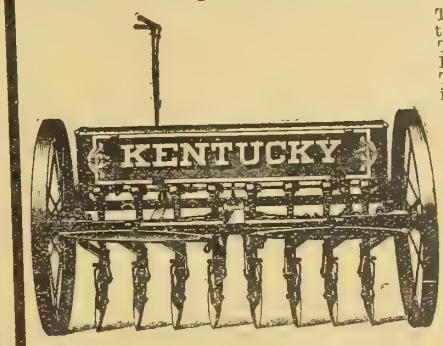
Make one job out of the two, and get your ground in finest condition by harrowing when the soil is first turned up.

KRAMER'S Rotary Harrow Plow Attachment

enables you to do this. Regular rotary harrow which attaches to any gang or sulky plow. It levels, pulverizes and makes a mulch of the "moist soil" that is not possible after the ground dries and "sets." Draft only slightly heavier—you'll be surprised to see how little. Everybody needs this great time and labor saver. Write for circular No. 84

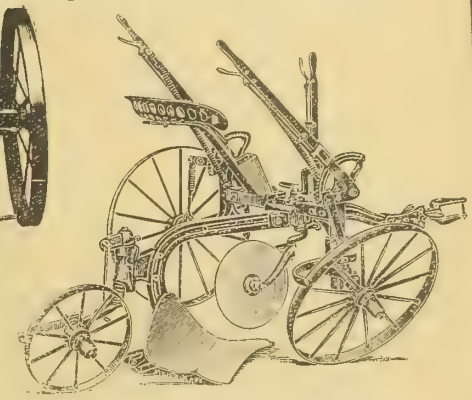
Deere & Co., San Francisco, Cal. Mitchell, Lewis, Staver, Portland, Ore.

Kentucky Disc Drill Syracuse Sulky Plow



The axle of the Syracuse Sulky Plow is made of two steel bars placed parallel; is above the beam. This is a decided advance in plow construction. Is a modern plow for modern farming. WRITE TODAY for illustrated circular. Sold by leading dealers or direct by us.

The record of this Disc Drill on this coast has been phenomenal. Its extreme simplicity, strength and general appearance has made it sell. The Kentucky Disc Drill now contains many improvements over its predecessors and many advantages not possessed by any other Disc Drill. Write for illustrated folder. It may mean much to you.



ARNOTT & CO., 112-18 So. Los Angeles Street Los Angeles, California

Rex Lime & Sulphur Solution

For Grape Mildew

This famous preparation of calcium sulphide has been found to be far superior and cheaper, and easier applied to grape vines for Mildew than Dry Sulphur. It also prevents the Thrip from remaining on the vines; it is a tonic to the vines; is guaranteed to be of a strength of 33% Beaume test with the largest possible amount of the Solution in the penti-sulphide form. It can be used in the dry weather and will adhere to the leaves and will not be blown off by the wind as Dry Sulphur.

For further particulars ask your dealer, or address:

IT IS UP TO YOU

In Three Issues of the Cultivator we have Told the Story of the

Kerman Tract

Told it plainly and fully, setting forth facts—and facts only—that can readily be substantiated by anyone who will come here to investigate for themselves.

We have outlined the possibilities and touched the probabilities; we have explained the "whys and wherefores" so that any reasoning boy can understand them; we have dealt with the land hunger of the east, with which we are conversant, showing that a California landslide has set in and is gathering force, a landslide that will raise horizontally every acre of productive land in California in the very near future; we have called attention to the many opportunities that have been missed elsewhere by those who hunger for land but who have fiddled away their chances, not only for a self sustaining home but for a fortune. We have called attention to the fact that the door of opportunity is yet open in the "new California," that it is practically the last west, and that it is high time to act before the land hungry easterner comes here and squats on what might have been, and should be, your opportunity.

More particularly, we have told about what is to be found at Kerman; of the magnificently rich fruit and alfalfa lands; of the water right that cannot be duplicated anywhere in California, character, quantity and price considered, a water right thoroughly tried, fully litigated, firmly established and guaranteed, a water right that has become the measure of merit for all others.

We have told of the location, of the climate peculiarly fitted for the production of high priced semi-tropical fruits, of alfalfa, dairy and poultry products, of the natural freedom from insect pests, a condition brought about by a peculiarly favorable climate.

We have explained the home comforts available—an abundance of pure soft water, cheap electric light and power, telephones and rural delivery to the farms, the good roads, beautiful avenues, in short, the chance for securing every comfort and most luxuries, besides the opportunity for the making of money. We have called attention to the record made by this tract in the past few months and hinted at what is coming. But most important of all, we want to say that the people already on the tract are of a character to make the finest of neighbors—no undesirables being allowed. The character of the settlers already here and the class now coming is sufficient guarantee for the future of the colony. They are making substantial improvements, are turning the tract into a garden spot, building good homes and beautifying their surroundings. Schools are plenty and churches available. The town of Kerman, located in the center of the tract, is up to date in every particular with advantages seldom found outside of large cities. It is now a division point on the main line of the S. P.

Of these advantages we have spoken and many more can be mentioned. Take the last three numbers of the Cultivator and re-read very carefully what we have had to say. It will pay you big if you are interested either in securing a splendid home or the mere making of money. Now

It Is Up to You

We can do little more except to answer questions, which is always a pleasure. We cannot knock you down and force this opportunity onto you. We cannot compel you to make money unless you want to. We cannot bring you here to look this colony over and to verify or disprove our claims. We cannot force you in on the "ground floor" so that in the future when these chances are gone that you will not regret losing them. We cannot convince you of the truth of our claims unless you give us the chance. We cannot do any of these things, though we are dead anxious to. Shall we have the chance?

It Is Up to You

We are ready and anxious to do our part. We are glad to make any reasonable effort to help you in this matter. Now is the time. And there is no time like the present. Our eastern connections inform us that all over the people are becoming interested in the **Kerman Tract** and that they will come here in increased numbers beginning with May and June. Every buyer from the east lessens your chance just that much.

Investigate this now. You can risk only your time and a little for traveling expenses. Right now either write to

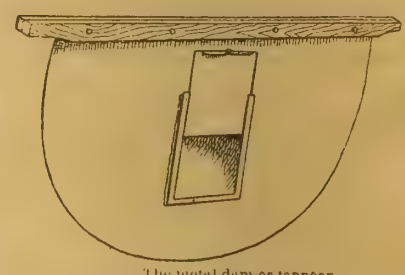
1. Furrow system.
2. Deep.
3. Yes. But abundant humus makes it unnecessary.
4. All of these things depend largely upon local conditions. (a) Ground should be saturated below the tap root. (b) From 24 to 48 hours in my soil. (c) Rich black soil, mixed more or less with gravel. (d) Yes, four to five feet.
5. The shorter the better. Probably the most practical, about 500 feet.
6. (a) By rigid regulation. (b) Yes.
7. No experience.
8. Largely owing to the weather, sometimes inside of 24 hours and



The metal dam or tappoon.

Unless one has almost perfect arrangements of gates and flumes the tappoon is almost a necessity. They are usually made without the little gate or opening indicated above.

sometimes three or four days. (b) We have a Planet Jr. two horse cultivator and a four horse one made at blacksmith shop. We use the one we consider necessary under the circumstances at the time.

9. In hot weather we smooth by dragging a chain behind the cultivator

10. Sometimes we do and sometimes we do not; owing to the condition of the ground.

11. We irrigate about once a month from May or June until September and later when necessary.

* * *

W. E. Wilsie, El Centro, Imperial Co.

Mr. Wilsie writes that for some reason he did not receive our first communication, but in response to another letter writes:

In a general way orchard irrigation will be the same in this valley as on the closer soils nearer the coast. I prefer furrow irrigation to any system I have tried, except that in winter if a green crop is growing I would flood the land. Our green crops can be put in early so they can be plowed under in time to get a good dry mulch before hot weather. Make the furrows deep and not too close together, three furrows between the rows and run small streams and let it run for a long time two or three days to fill the ground below with as little wetting of the surface as possible and your dry mulch will be preserved. As soon as the furrows are well settled (not dry) run over with a scraper made for the purpose filling the furrows with dry dirt. In a short time start a fine tooth cultivator and cultivate deep, but do not bring the moist dirt to the top, in this way the roots will be kept down. Irrigation will be required less frequently and it will be more effective.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. Minna E. Sherman

SEVERE CASES OF GARGET.

WHEN milk comes from the teats as curds and whey the trouble has passed into a severe form. When this occurs and clogs the opening of the gland into the milk ducts the case is likely to prove troublesome. When the tube can be inserted it may be used to put aside the curded mass. Now, I hesitate always to tell others about this form of treatment as many do not realize what complete sterilization of tubes and material used means. One quart of warm boiled water and a teaspoonful of baking soda added is injected through the milking tube and the finger held on the end of tube for at least a minute, before the tube is gently withdrawn. The milking tube should be boiled before using and lifted by a thread previously tied on the ring and dropped into a bottle of carbolized vaseline. It is only withdrawn from the vaseline at the cows side and handled by the lower end slipped in quickly and the rubber end of the garget syringe inserted and the soda water gently forced into the udder. Rolling and moving the udder a little, if it is not too tender, will help to bring the water into contact with more of the curds. After half an hour, milk out all that will come from the affected quarter. If more than one quarter is affected the milking tube should be sterilized again before being used, or two tubes should be sterilized. Now, do not put the tube after using back into the carbolized vaseline, but into the pan that has the soiled things in it. Repeat these injections of warm soda water until the curd is reduced to a fluid condition and milked out.

Garget Outfit.

The regular garget outfit, in mild cases, can be used to force air into the udder and this will expand the glands and relieve the inflammation in many cases. I have heard the air going into the udder make a sound like the small pops and gurgles of a full bottle turned upside down. The garget outfit costs about $4.00 and, if many cows are handled, pay well to own. Unless one has some experience, it is well to send for a veterinarian to attend the cow. There was a time when these men were quacks and one had to tend to the animals themselves. I, personally, gained an insight by having a father and a husband who both practiced medicine for many years, on the human family. These cow troubles are much the same as those of the human mother and the family doctor can give good advice in their treatment.

Bad Cases.

If curds have formed and been neglected the cow may become stiff in her hind quarters and lame in the back. Her appetite will be entirely gone, eyes will show fever and the nose become harsh and dry, breathing heavy and pulse quickened. Pus forms in the udder and, while cows rarely die from blood poisoning from this pus, they suffer greatly and should be helped along by poultices of flax seed meal and hot bran. As soon as the abscess has formed, have it lanced and dress it with whatever the doctor prescribes. We have used the following for some years. One dram of carbolic acid, two drams of camphor gum and five ounces of linseed oil. Dress the part with sterilized gauze soaked in this mixture. When the pus stops forming and the wound looks healthy, a dusting of powdered charcoal is all that is necessary. Now, one would think that this would ruin a cow as a milk producer, but it is surprising how many will soon give a full flow of milk again. The portion of the udder having had the abscess, may not give a full flow of milk, but the rest of the udder will take on greater activity and the cow give her full normal amount of milk. The cow seems to have just so much milk to secrete and nature is determined that she shall have a chance to do it.

Gangrene.

Sometimes things happen on a dairy ranch that are dreadfully wrong. At one time, when I had only a few cows and a poor milker, I took a vacation myself and when I returned the foreman reported a sick cow. I went down to the barn and found the daughter of Romeo Aaggie's Acme had an udder swollen to great size and already it had the appearance of gangrene. I immediately bathed the udder with formalin and then soaked a piece of gauze in a five per cent solution and put it over the bad portion. Then a simple tonic was given her and, so far had she gone, it was necessary to drench her with a gallon of warm milk to help her keep alive until morning and then a good veterinary would come. When he came he looked sorrry and advised that she be put to an end. I said: "No! she shall have her chance." So we took her out and intended to operate, but, as she staggered along, the diseased portion of the udder consisting of three teats and three quarters of the udder dropped off, leaving a clean fresh surface. This was promptly sterilized by a spray and dressed with iodoform powder. The cow made a quick recovery. She has raised some fine calves and has paid her way in the herd with a quarter of an udder. She milks from thirty to thirty-six pounds, when fresh, of 4.1 per cent milk. I think, barring this accident, her mother's record would not have been the best of the Romeo Aaggies. I believe, even, that of other cows here on the ranch, Puliana de Kol would have stepped down from her world's record as a heifer before this one.

Simple Cow Tonic.

The simple cow tonic referred to in the above paragraph is a harmless one and helps the cows. Two ounces of gentian, two ounces of ginger, sweet spirits of nitre. Give as one dose in a bowl of oil cake gruel.

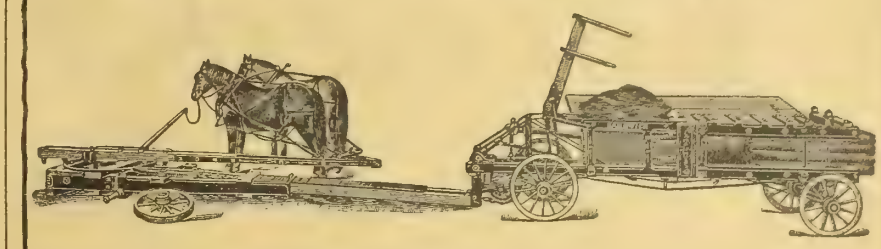
Of course, a few other things are often found wrong with a cow's udder and one of these is bloody milk. Congested condition of the udder will sometimes produce this trouble, and again the teats may have abrasions

FAST-WORKING

SOUTHWICK

TWO-HORSE SELF-FEED

HAY PRESS



No question about it, its the best horse power press made. Note its good points—great capacity, perfect bales, ease of operation, durability, full 40-inch feed opening, long bale chamber, low bridge, self-feed, stands on the wheels when in use,—a perfect press—and a money maker.

Get your order in to us quickly, as it will soon be too late to secure them in time for this season's baling.

We also have the Sandwich Engine-power Belt Presses—splendid machines of wonderful capacity. Also smaller presses—all-steel, self-feed.

We have many testimonials—here is one of the latest:

Colegrove, Cal., April 17, 1909

Hawley, King & Co.
Los Angeles, Cal.

Gentlemen:

I have worked on a Southwick horse-power press for twelve consecutive seasons, and now own one which I bought from you two years ago. I have baled as high as 40 tons in one day. On one occasion we baled 20 tons before noon, and last season—1908—I averaged 32 tons per day for the entire season's run, during which time I baled 2060 tons of all kinds of hay. I would not have any other kind of Hay Press.

Yours very truly
P. Bergon

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 39 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

The Most Perfect

Cream Separator

That Money Can Buy.

The United States 1909 Models

Nos. 14 and 15, like all other sizes, are absolutely unequaled.

They are **the standard** Separators of the world.

They are entitled to this claim of being **Standard** because they won out in the greatest contest of Cream Separators ever held at any National or International Exposition in 50 consecutive runs, lasting through one month, on the milk of 10 different breeds of cows. The ***De Laval Disc Separators*** and the ***Sharples Tubular Separators*** were entered in this contest and **were beaten.**

The United States Separators are used by a very large percentage of the leading breeders in all the 10 leading dairy breeds of cows.

The United States Separators are used by progressive dairymen and creamerymen everywhere.

The United States Separators have **handsome frames,** cast in **one solid piece.** They have **waist low supply cans.** The **gears** are all **enclosed, dust proof** and **self oiling.** The **bowls** are **most simple** in construction and **easily washed** thoroughly in all parts in from two to five minutes. No long goose neck pipe in the United States to get foul and difficult to clean.

Dairy women as well as **experts consider** that the **United States** is now the **easiest cleaned, turns easiest, skims cleanest** and **wears longest.**

The United States was the originator of the enclosed, dust proof, self oiling gears. All others using this feature are imitators.

on the inner sides that give out a few drops of blood on being pressed. Bathe for ten or fifteen minutes in cold water and rub the udder with camphorated oil. The old remedy was a teaspoonful of sulphate of iron every morning, but, in these days, the fact is that very little iron will be taken up by the system and it is doubted if it does the good it is considered to do.

As the years go by, the world is learning slowly that more and more of the medicines that were thought infallable chiefly produced their curative effect on the mind of the patient. —M. E. Sherman.

EDUCATIONAL BUTTER SCORING CONTEST.

The call for the second entry to the California Educational Butter Scoring Contest brought response from twenty-four creameries.

With one or two exceptions all butter arrived in good condition and there was a marked improvement in the appearance of the packages and the care taken in preparing them for shipment. In several instances the interior and exterior boxes were wrapped with burlap and in one case the inner box was packed with ice. We mention this to show that there is a determined interest in this contest, which we hope will be maintained. The excellent body and firmness noted in most entries should encourage those who took pains to cool and pack carefully before shipment. Two or three who competed before failed to send entries this time, while several new ones appeared. We have noticed a little carelessness in filling out the report blanks accompanying each entry. The buttermaker should fill these out each time as completely as possible for it helps us in rendering a proper criticism. The criticisms should be the "meat" of the contest, hence a full report with each entry is essential.

The scores, as placed by Mr. C. L. Mitchell and members of the Dairy Department, are as follows:

	Score.
Gridley Creamery, Gridley	96
University Farm Creamery (not competing)	95¾
Western Yolo Creamery, Winters	95
San Pasquel Creamery, Escondido	94¾
Bay Views Creamery, Napa	94½
Ceres Creamery, Ceres	94¼
Pozzi Creamery, Tomales	94
Edence Creamery, Petaluma	94
Colusa Butter Co., Colusa	94
Suisun Creamery, Suisun	93½
Pozzi Creamery, Marysville	93
Rose City Creamery, Chico	92½
Laton Co-Op. Creamery, Laton	92
Silva's Creamery, Santa Rosa	92½
Homestead Creamery Co., Nicasio	92
United Creameries, Arcata	92
Crystal Cream & Butter Co., Sacramento	91½
Denman Creamery Petaluma	91½
Elito Creamery, Nicasio	90½
Antelope Creamery, Topaz	90

Four scored below 90 making a total of 24 entries. One or two creameries reported unavoidable embarrasments, such as a sick buttermaker, or a delayed notice of date when entry was due. Consequently in the rush to hold their places, a lower grade of butter was sent to the contest, which explains some of the apparent declines in quality.

The judges were greatly encouraged with the quality of butter sent to this contest. It averages considerably better than the butter of the previous one, though somewhat better quality should obtain at this and the succeeding contest because of more favorable food and weather conditions. Again we call attention to the use of starters and scrupulous cleanliness in the creamery. There is evidently some trouble from old cream and perhaps some carelessness in getting cream delivered promptly and putting it as quickly as possible under control. Get the starter can in place as soon as possible. From the reports there is no apparent increase among the contestants of those using starter. Under favorable conditions some have done well without starter, but it's a mistake to continue trusting to chance fermentation. If a creamery cannot secure skim milk for starter making, the directors had better provide the buttermaker with a cow.—Herbert A. Hopper.

THE SCORE-CARD SYSTEM OF DAIRY INSPECTION.

Modern investigations in dairy sanitation have shown the importance of producing and handling milk under clean conditions, and a significant factor in attaining that result is the score-card system of dairy inspection, according to Messrs. Clarence B. Lane and George M. Whitaker in a report just published by the Bureau of Animal Industry of the United States Department of Agriculture. The main advantage that they attribute to the score-card system is that it deals with itemized conditions. City milk inspection a few years ago was merely a matter of detecting added water or preservatives. With recent progress in sanitary science the work has broadened, and boards of health are now investigating the sanitary phases of milk production, transportation, and distribution.

In the smaller cities most of the milk consumed is retailed by the producer, and even in places of considerable size many producers are also retailers. In cases where the functions of producer and retailer are merged in one person an inspection of the dairy farm discloses the methods of distribution as well as production, and the dairy farm score card answers all purposes under such conditions.

As cities grow, middlemen become a necessity and their places of business are more familiarly known as "plants." These plants have wide range of capacity, equipment, and methods. One extreme is a building 300 to 400 feet long on a spur of a railroad where milk is received by the train load, cooled, mixed, filtered, perhaps pasteurized, canned or bottled, and held in cold storage until retailed in the city. The other extreme is the dealer retailing only a few gallons who may have no plant and his equipment consist of only a carrier can and a quart measure which were washed in the kitchen sink with the family dishes; or he may have fitted up the dark, illy ventilated basement of his residence as a "milk plant," with a wooden tank for cooling the milk, a few dozen bottles, a washtub in which to cleanse them, a dipper for filling, and a brush to agitate lukewarm water inside the bottles. It does not necessarily follow that all small dealers adopt improper practices, but the chances are that the ordinary milkman with small capital and only a little at stake will not take as much care as a person differently situated.

For the past two years the Bureau of Animal Industry through its Dairy Division has been making a study of dairy inspection with a view to developing a system that would be practical and comprehensive, and has assisted the authorities of a number of cities in different sections of the

country in applying such methods for the improvement of their milk supplies. Some results of this work, together with instructions for using the score-card system, are given in the publication referred to, which may be had by addressing a request to the Bureau at Washington, D. C., for Circular 139.

A striking example of the possibility of improving dairy conditions through the score-card system is shown in the report of 20 dairies at Richmond, Va., which made the greatest percentage of grain from the first score to the last during a period of six months. The lowest score was 20 points on a scale of 100. "This place," said the health officer, "was indescribably bad. Seventeen cows were huddled into two dark, foul sheds, with about 200 cubic feet of air space to each cow. The water supply was grossly contaminated. The milk was poured from dirty milk pails into cans which stood in manure in a dirty stable yard. Everything was in keeping with this partial picture." This dairyman immediately took steps to meet the requirements of the scoring system in use, and his scores showed steady improvement visit by visit, the last score showing 62.5, which was above the average. The same health officer further states:

"Common justice demands that full credit should be given to the milk producers and to the city dairymen for their share in what has been accomplished. To anyone who was familiar with the conditions under which milk was produced and sold in this city a year ago, a visit to the dairy farms supplying us with milk at the present time would prove little short of astonishing. On every hand new stables have been erected and old ones improved, milk houses have gone up, stable yards improved, and most important of all, better methods of milking, handling, and transporting milk."

Many large dealers employ an inspector to give dairies supplying them with milk a rating on the basis of the score card, requiring them to reach a certain standard or stop shipping milk. To illustrate: One large milk company added the following note to the list of prices: "These prices apply only to those dairymen whose premises are scored 60 per cent or higher by the department of health. Those who score less than this will have a reduced price paid, and milk from dairies scoring less than 50 per cent is not desired and will not be accepted."

Unless public sentiment demands a good quality of milk and consumers are ready to meet the increased cost, improvement must necessarily be slow.

RID SOWS OF WORMS.

Few realize what inroads into swine herds worms make every year, and what a menace they are to successful hog raising, says a writer in Farm Stock and Home. A hog cannot thrive when irritated by these parasites, which are many times present in great numbers without producing very noticeable symptoms. The farmer goes on, feeding his hogs, and wonders why they are so unthrifty and ungrowthy. In many cases the trouble can justly be assigned to the presence of worms. There are probably few herds in which they do not exist.

Large feeders rarely start in to feed a new bunch of hogs, without first treating them for worms, for they have learned to their sorrow the futility of feeding an infected animal. Worms reproduce by means of eggs. These pass out of the animal's body with the manure and lie about in yards or barns or on the grass, waiting to be taken up into some other hog's system, there to develop and reproduce themselves. One hog with a single worm may be the cause of infesting a whole herd. Damp filthy places are most favorable to the egg or embryo, and if one is anxious to be free of worms, he should take care to keep surrounding conditions clean and sanitary.

Now is the proper time for worms. Whether one knows it or not, their intestines may be practically teeming with long, pinkish worms, and unless he gets these out of the systems, and things cleaned up before the young pigs arrive, they in turn will become wormy. It may take a little time and trouble to treat the sows now, but it will pay a dozen times over.

Sows troubled with worms should be kept off feed twelve hours or so, then given a dose in the morning of turpentine or gasoline. This should be given in milk, one teaspoon to every 80 or 100 lbs. of live weight. This amount may even be increased, after the hogs have taken it a few times. This dosing should be kept up for a week, the hogs being fed their regular ration only once a day. Much better results are secured by dividing the sows up into bunches of four and five, as each one then gets his exact share of the dose.

When sows are once freed of worms, place constantly before them a mixture of equal parts of powdered copperas and salt. This should be kept in a box out of the weather and where the hogs can get it at will. Another good tonic is made up of charcoal, salt, ashes, copperas and air slaked lime, mixed in varying proportions according to one's own idea. All of these substances are obnoxious to worms, and tend to keep the system free of them. If one gets his sows cleaned up and keeps them so, the pigs will stand an even chance when they appear. If they, too, are given these tonics from the start, and kept thrifty and strong, they will not likely be troubled with worms.

TO PREVENT ABORTION.

Give two drams of pure carbolic acid, well diluted with water and mixed in the cow's feed every other night, each alternate fortnight commencing at end of second month of pregnancy and continuing until the end of the seventh month. If the cow will not take the carbolic acid in feed mix it with a pint of skim milk or of flaxseed tea and administer it as a drench. At the same time the stable should be cleaned, disinfected and whitewashed and every day the rear parts of the cow should be sponged or sprayed with a 2 per cent solution of coal tar disinfectant.

SHOATS ON SHORT FEED.

It takes a lot of good feed to fill out the lines of a shoat that has long been on such short feed and get him back to the form of thrift that he showed when he left his mother to shift for himself. No man ever saw a pig making profitable growth or doing a fraction of what he is capable when his hair is dry and standing every way, his belly girth double that of heart or flank, as many a shoat shows today, and all because of lack of a little more feed.

CITRUS TARIFF.

One of the most conclusive proofs of the value of co-operation is shown by the magnificient fight put up by the California Citrus Protective League. That league is a voluntary association, embracing practically all of the citrus producers of the state. When the importers made an onslaught on the orange and lemon tariff, this association sent several of its strongest men to Washington to place before the Ways and Means Committee information as to the citrus industry of this country.

From unique booklet issued by the league which is placed in the hands of each member of the committee we note:

While the production of California lemons has increased during the past ten years, the percentage of home grown fruit consumed in the United States has not materially increased. In 1901 67 per cent of the consumption was imported; in 1907 64 per cent; in 1908, 2,231,125 boxes of lemons were imported into the United States, which was the heaviest importation in the history of the business and was an increase of over 400,000 boxes in excess of the importation of 1901.

"Experience has demonstrated that California possesses the requisite soil and climatic conditions to produce lemons equal to any grown in Italy.

"Lemons are a household necessity in all portions of our country, necessary to health and a comfortable existence.

"The 2,000,000 boxes annually imported from Italy if grown in California would furnish continuous employment at good wages to 5,000 people and would comfortably support 5,000 families in the United States.

"All of the lemons required for consumption in the United States could and would be grown in California if the tariff duty was sufficient to equalize the cost of labor and transportation between Italy and the United States."

These and other facts have brought forcefully to the mind of Congress the importance of protecting this industry in this country. We trust other fruit growers of the state will observe the important lesson and secure as strong an organization to protect their interests.

HIGHER PRICES.

The recent gambling plunge in wheat by which its price was boosted beyond that which is ligitimate, or at least beyond that which production and demand require, has called attention more than ever before to the great injury which gamblers inflict upon this country. Naturally as a friend of the producer, the Cultivator has no wish to bear a price in any production of the farm. In fact, but few farmers will derive any advantage from this recent flury. It is often to the benefit of the gambler to depress the price instead of increasing it and that is the time when the farmer receives greatest injury. Notwithstanding this position in which the farmer is, the mails have been flooded with "news items" in support of the gambling in futures, all presumably "in the interest of the farmer." For instance, in one of these we note the following clipped from the Manufacturer's Record.

"When farm products were low and farmers were literally bankrupt, when agriculture was at its lowest ebb and the people of the country were rushing to the cities in order to find some means of making a bare living, the mouthing orators, and, to their shame be it said, some ministers, densely ignorant of what they were talking about, preached the gospel of hate to the so-called "money power," claiming that this great money power, whatever it may be, was crushing the life out of farmers. The bankers, gamblers and speculators, all classed as the money power, were said to be in collusion with Europe in order to destroy the value of American farm products."

When the "money power" uses its power ligitimately, all hail to it. As an aid to the gambler it is only a curse.

Now, the farmer wants living prices, he also wants fair treatment at the hands of the country and demands that the gambler shall cease to command the market and that honest prices may prevail. If this can be done, we believe that the prices which are just will be secured and that when the farmer is ready to market his crop he will receive fairer treatment than he does now when every inducement is offered to speculators to control the market.

REGISTERING FARM NAMES.

As will be seen on another page in a letter from the Secretary of State that office is now ready to receive applications for "claim to trade mark." The act which was passed by the recent legislature amending section 3196 provides that any farm owner may secure a trade mark priviledge for the name of his farm under practically the same regulation that the tradesman may register a trademark to protect the name of any make of his merchandise or manufactures. The same application for the farm name registery will be used as for the regular trade mark and the fee will be $5. This fee will be a small matter to the man who wishes to protect the name that he may mark his fruits and who has a large traffic in his own products. But for those who wish simply to protect their name the $5 fee will be somewhat of an objection. We think possibly the Missouri plan where the fee is only nominal and where the name is protected for each county in the state, that is, the same name may obtain on a dozen ranches located over the state providing no two ranches in the some county have the same name is a better plan.

There is one good point in this law and that is that it places the farmer on the same basis as the manufacturer or merchant in that they may protect the trade mark. The act is purely for commercial purposes and not of so much value for those who for largely sentimental reasons wish to protect their farm name.

RAISIN DAY.

Raisin Day was entered into with a hearty spirit which should please all concerned with the growing and marketing of the raisin. We do not know how general the observation was in the East, but in towns of this coast surely the good will expressed, and the raisins eaten, will reduce the stock of hold-overs. In Los Angeles, hotels made raisin pies, cakes, bread, doughnuts, salads and even soups. For this latter dish we believe the Alexandria Hotel held the unique distinction of having the exclusive formula. But the raisins eaten on this day is a small factor in the good done. The actual good is in calling attention of those who eat to the fact that the raisin is not only a most agreeable food, but a most nourishing and healthful one. The state seems to be looking to the prune men to take up the next campaign and instruct us as to whether the prune is used as a food for humans, then perhaps we will reduce the surplus prune output.

CHERRY DAY.

San Leandro is planning for a great celebration in July to commemorate the fact that it is a great factor in the production of cherries. We believe it has no expectation of equalling the wide spread popularity which was secured by the Raisin Day Committee, but will simply have a jolly neighborhood celebration.

Saratoga had her Prune Blossom Day, Pasadena her Rose Carnival, Hollywood her May Day Flower Show, Sacramento her Camellia Day, Santa Rosa her Rose Day and so on over the state. Let each community have a celebration on its birthday or other occasion which advertises it and brings it citizens together in a closer bond.

MISSION ARCHITECTURE.

We are informed that the supervising architect of the Treasury has decided that hereafter Government buildings erected in California shall be built in the Mission style of architecture. The belfry towers, red tiles and characteristic arches are supposed to enter into the style of architecture and it is most gratifying to Californians to note that the Department has accepted this characteristic style of architecture and hope its use will become popular with all public buildings. We understand Riverside is to be given the first building in this style.

LUMBER TARIFF.

The country over has taken it for granted that the revision in the tariff assured free lumber; but, from present indications, lumber interests are great enough to prevent the consumation of this desired end. Even the Pacific Coast with its vast lumber industries is, we believe, almost unanimous in its desire for this step which it is believed will result in extending the life of that industry in this country. If Congress wants to make a real revision, let it give us free lumber.

According to information received by the Department of Agriculture through the Department of State, the Belgian Government has issued a decree, effective May 1, removing the restrictions previously imposed against the importation of cattle from the United States because of the existence of foot-and-mouth disease.

Automobiles in Hawaii are held responsible for the rapid deterioration of the public roads, which is now causing considerable concern. New methods of road making will be tried, including the petrolithic tamped system which it is hoped will prove more serviceable than the present macadam surface.

Agricultural Notes of the Pacific Coast

Northern California

Red Bluff, Tehama county has a wool scouring plant now in operation.

Placer county is discussing the advisibility of a good roads campaign.

One firm at Willows has planted this season 11,000 Symnra fig trees.

A meeting of wine and raisin growers is to be held in San Francisco, May 18.

Spud growers are tickled over the price to which good potatoes are now soaring.

The Geyserville prune growers have recently been shipping a quantity of last fall's crop.

Two horses were recently killed in Glenn county because of being affected with glanders.

The State Fair proposes to have an ostrich race as one of the features of the coming fair.

The Central Milk Co. of San Francisco was recently fined $200 for selling adulterated milk.

Two farmers near Suisun will furnish a San Francisco crockery firm 100 tons of tule grass.

Farmers and especially grain growers would have appreciated more rain during the month of April.

Much butter is going into storage in San Francisco and it is thought bottom prices have been reached.

A co-operative dried fruit company composed of growers about Winters will soon build a big storage ware house.

Hayward's Poultry Producers Association recently entertained the San Francisco's Grocers Association at a banquet.

The first box of California cherries to go East was from Vacaville, Solano county. On April 22nd it was sent to Philadelphia.

Wholesale killing of horses has been going on at a large ranch near Gridley in the hope of stopping the epidemic of glanders.

The Alfalfa Farms Co. of Jacinto, Glenn couny, has completed a half dozen wells which will be used for irrigating alfalfa land.

The Sacramento Valley Sugar Co., has contracted for the growing of several thousand tons of beets in Butte valley, Siskiyou county.

Placerville, Eldorado county, occupies the unique position of having a barn wrecked by a stroke of lightning during a recent storm.

The San Francisco Wholesale Dairy Exchange is protesting against the advance in icing charges in car loads of butter and eggs from Eastern points.

One Red Bluff wool producer reports a sale of wool at 24½ cents, which, so far as known, is the highest price secured by a California wool grower this season.

Owners of sheep which are to be grazed in the National Forests must comply with the rules and have all sheep dipped and show certificate that they have passed inspection.

A big unfermented grape juice plant of the East seems to have a strong hold in the Eastern market so that California grape juice producers have found difficulty in securing a market for their output.

Central California

The Rasin Day Committee are elated over the success of the Rasin Day observation.

Alfalfa hay at Hanford is now selling at $7 per ton and is somewhat mixed with foxtail.

The Turkestan alfalfa at Tulare station is proving a better winter grower than the common variety.

King's county has purchased a dipping plant to be used to eradicate cattle tick from cattle of that county.

About half of the Tulare Indian Reservation near Porterville has been placed in the Sequoia National forest.

Selma sent 40,000 quarter pound cartoons of raisins to extreme Eastern points for distribution on Raisin Day.

Local berries from San Joaquin valley are now replacing the southern varieties which earlier filled the market.

The Monterey Mule Co., is now incorporated with a capital stock of $50,000. Its principal place of business will be Salinas.

The two sugar factories at Corcoran and Vasilia will consume about 30 car loads of beets per day. The season will last about 100 days.

More intensive planting is urged for the lands west of Hanford. It is pronounced to be an exceedingly good location for tomatoes and vegetables.

Tulare county stock men joined in extensive dipping operation to more perfectly eradicate the Texas fever tick.

A prospective colony of Germans inspected lands about Exeter recently with the expectation of making a home in that section.

Farmers who were fortunate enough to have early cutting of hay have rushed their product to market as rapidly as possible so as to secure the high prices.

The old California Rasin Grower's Association is not allowed to die a peaceful death, but is still disturbed with litigation which it is hoped will soon be settled.

The Melon Growers' Association of the Alta district, Tulare county, shipped 141 cars of melons last year. It is hoped to handle a still larger output the coming year.

The Foothills Citrus Farms Co., having large holdings on mesa near Bakersfield are enabled through development of wells to make extension of the orange plantings.

Owing to the loss of a weir in the King's river, irrigationists near Hanford have been inconvenienced by a shortage of water for a time. This weir originally cost about $20,000.

The Corcoran Sugar Co., is now employing a number of men fitting up the factory for the coming season which will begin about June 1st. When in full swing the factory will need about 100 skilled men.

A hot time has been experienced in Tulare county over the refusal of the Horticultural Commission to allow a car of trees from the Southern end of the state infested with scale to be sold. It was maintained that the infestation was exceedingly light and that no injury would have come from the planting of the trees.

Southern California

Indio reports large numbers of turkeys hatched and doing well.

Over 8,000 acres of sugar beets have been planted about Alamitos.

A full car load of eucalyptus trees was recently sent from Redlands to Banning.

Orange County Board of Supervisors have elected Dr. H. J. Stevens, county veterinarian.

The Florida Orange Growers have been shown California methods of fruit packing during the last week.

J. H. Reed, the veteran tree warden of Riverside who recently resigned, has been prevailed upon to withdraw his resignation.

Imperial Valley hopes to market barley during the month of May and that means the probable securing of the present high price.

Large numbers of seed bed orange trees have been planted this year. It is thought that a lower price will prevail within the next few years.

Japanese celery growers of Orange county have decided to join the Celery Growers' Association and unite with white men in marketing their output.

The marketing of the regular onion crop of the Coachella Valley is now in full blast. They are selling for approximately three cents per pound.

The Reclamation Service is still making surveys to determine the advisability of a canal to the Coachella and Imperial valleys from Laguna dam.

The Santa Fe cut off which is planned through Southeastern California and a part of Arizona will open up a large quantity of magnificent land in both California and Arizona.

It is rumored that Jap and Chinese gardners have formed a big vegetable trust and are endeavoring to secure possession of the Los Angeles market and control the entire vegetable output of Southern California.

Some walnut growers of Ventura county are now turning under a rank growth of foenugreek and other green manure crops. It is also reported the Limoniera Company has an apparatus for cutting up the finer prunings from the trees and plowing under.

The Texas horticultural commission has served notice on the commission of California that oranges shipped to that section, infested with a scale, will be confiscated and burned and if it should come in any quantity, a rigid quarantine will be established preventing its entering the state.

The members of the Tri-Counties Reforestration Committee which recently held its quarterly meeting at Riverside, reported progress in the matter of spreading of storm waters of the Santa Ana river over waste land so that the water has been conserved in the lower strata of gravel.

We have often seen reference to northern fruit, especially oranges, being shipped under the Los Angeles brand, also recently large shipments of asparagus were shipped under the brand of a Los Angeles shipping concern. This always causes adverse comment on the part of the northern growers. Now, we note Southern Californians are up in arms because Southern California raisins are shipped as Fresno raisins.

The Coast

Spokane, Wash., is eating Florida grapefruit.

Many apple trees were set out during the past season at Chelan, Wash.

The Walla Walla, Wash., county bee keepers have formed beekeepers association.

Farmers at Ferry, Wash., are finding the use of blue stone valuable in keeping down weeds.

A ten acre apple orchard in the Hood River section, Oregon, recently sold for $1000 per acre.

The interior department has thrown 200,000 acres of land along the Green River, Colorado, open to entry.

The price of export flour at Seattle, Wash., has advanced 25 cents per barrel and is now reported at $5.65.

Squirrels are destroying the winter wheat and other grain crops through Columbia and Umatilla counties, Oregon.

Farmers about Pueblo, Colo., have secured control of the city market, and are marketing their own produce direct.

Colorado apple growers have planned for a National Apple Exposition to be held in Denver next December.

Garfield, Wash., ranchers recently bought an entire train load of cows to be fattened on Whitman county pastures.

The orange groves near Yuma have been cleaned of all fruit and no more shipments will be made until November.

Vast numbers of sheds have been erected on the Alaska Yukon ground for the cattle display which will open on Sept. 27.

A sharp rivalry exists between creameries at Marshall, Wash., for the milk of that section and good prices are paid to growers.

The demand for heavy draft horses at Pullman, Wash., is in excess of the supply and a fairly good span commands $450 to $600.

A lumber company at Marshfield, Oregon, has succeeded in making paper pulp from stumps and waste material from the mills.

The Douglas county creamery at Gardnersville, Nev., report a successful season. During the last six months the patrons were paid $36,000.

The third annual fair of the Woodburn, Oregon, Horse Association recently closed after a most successful run, 6,000 people attending.

Washington State College has a large increase of the live stock belonging to that institution. High bred cattle, sheep and hogs make up the recent large purchases.

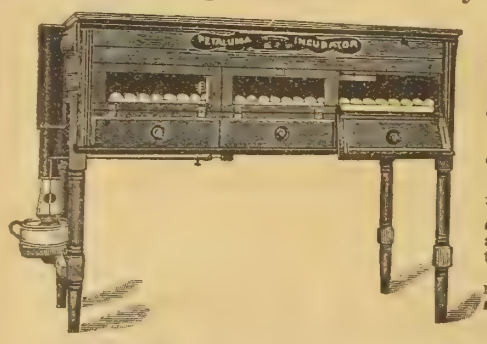
A new tract of land will be opened up and improved near the city of Denver by which 12,000 acres will be brought under irrigation and made a vegetable and fruit producing centre.

Preparations have been under way since last fall for holding the second annual Colorado Inter-State Fair and Exposition, which will take place at Overland Park, Denver, September 12 to 18, inclusive. Mr. G. C. Fuller, the secretary of the Exposition, advises there will be complete classification with liberal prizes offered. The premium list will be ready for distribution the latter part of May.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. You ***can't*** afford to try and be successful and not get results. ***Midland Poultry Food*** will produce results. Try it and see. $1.95 per sack



Petaluma Incubators and Brooders

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Petaluma Incubator Company

Petaluma, California

Our General Agents for Incubators and Brooders and Midland Poultry Food:
Petaluma Incubator Co., Petaluma, Cal.
Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles
Berrar & Robertson, San Jose, Cal.

When the chicks are hatched don't feed them anything for 24 hours, then feed them the best dry Chick Feed you can get. We say that is

West Coast Chick Feed

SAMUEL R. KELLAM, former president of the L. A. Co. Poultry Association, says: "West Coast Chick Feed is the best feed for young chicks I have ever used. I have given this feed a thorough test, and have always found that it produced fine, large, healthy chicks."

MRS. A. BASLEY, the celebrated poultry authority, says. "I want some more of your West Coast Chick Feed, for it is excellent. It is purer, cleaner and appears better balanced than other feed I had been using, and to tell the truth, I have been experimenting, feeding both together, and they always eat yours in preference."

Ask your neighbors, for there is more of "West Coast" sold in Southern California than all other kinds put together. If not sold by your dealer send us $3.50 and we will send a 100 lb. sack, freight prepaid within 300 miles.

West Coast Mill

705-709 So. Griffin Avenue, Los Angeles, Cal.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

A FEW WORDS.

THERE is a great deal of controversy regarding the balanced ration and the fact remains that the perfect one has not yet been found. Scientific investigations prove that such and such foods, contain such and such elements, but, true it is, that these elements change during the process of digestion, and in different individuals produce entirely different effects. So with breeds, what one breed will thrive and lay well upon is not sufficient to keep another breed in health.

We can only study our flocks and try to find which food combinations "agree" best with our particular kind of fowl. Then when we are sure that we have discovered the ideal diet, along comes a condition of weather or a state of health in the fowls themselves that knock all our theories skyhigh, and we have to go hunting and experimenting all over again.

Diet.

To me, it seems that fowls relish a change of diet as much as we do and that to stick to one food, or combination of foods, for any length of time, is to invite trouble. Therefore, I believe it is well to change the grain often.

Wheat, we know, contains nearly all the elements necessary to sustain life, yet, a continued diet of wheat will induce leg-weakness because of its hardness and the tax upon the digestive apparatus. Corn contains heat-producing elements and fat forming material and is indispensable, yet cannot be fed alone. Milk is excellent, but is best fed in moist mash, which should not be used more than every other day. Fowls do not as a rule, take readily to milk as a drink, and it does not take the place of water and if left standing long in the drinking vessels becomes so sour as to be a menace to the health of the flock. Oats and barley are good foods, oats especially so, but do not make a perfect food. Meat they must have, and the ideal way is to give green cut bone with some meat adhering to it, fed fresh. One-half ounce to a fowl is sufficient, once a day, and if diarrhoea should result, every other day. Grit and shell they need "in their business" and they must be kept constantly before them, or, first we know, soft shelled eggs provoke us to wrath at our shortsightedness.

Green food must be provided all the year around, and, anyone who has a flock of hens to see after, has duties which must be done, and done every day and to the genuine chicken crank, these duties become pleasures, but to the busy man or woman, who has enough to do without bothering with chickens, these essentials are often sadly neglected, and the fowls kept in a hap-hazard fashion which does not result in satisfaction to any one concerned. Neglected fowls do not pay because they cannot maintain health and vigor unless given the wherewithal to secure it.

Over-pampered fowls, on the other hand, become useless from over-indulgence just as pet poodles become wheezy and asthmatic from the same cause. It takes study and time to find out just where over-feeding begins, and those who have not the requisite patience better not attempt the chicken business. Examine the birds for fat, at times, and if you can feel great layers of it around the egg organs, you must let up on the food.

Over-fat hens will not produce fertile eggs and are prone to drop off the roost with apoplexy any night.

Exercise.

Exercise is good for fowls at all times and the old woman's method of "chasing them up and down a greased plank" had wisdom back of it, though mythical. Litter is not always available, but one can spade a place in the ground and bury the grain in that, so they will have to scratch for every grain in this country where the ground never freezes. If they miss a few grains, they will sprout and make all the better food, and if the ground is sprinkled so as to keep it moist, so much the better.

Make 'Em Scratch.

A very good way, where the ground is mellow, is to have a garden hand plow, turn over a furrow the length of the yard, put in the grain and plow it under. The fresh ground attracts the birds, who soon find the grain, and look for it every morning. Then what glorious wallows these furrows soon make and a new place may be turned over thus keeping the ground sweet by contact with sun and air. "Keep your fowls, and by and by they will keep you."

The properly balanced ration consists of one part protein to four parts of carbonaceous food. This ratio is all right for only part of the year as changes in the weather and the hens condition make different rations necessary. Take the spring time, when the hen is in natures condition to reproduce her kind, less of protein is really needed than at any other time of year, yet that is the very time when most people feed more.

During the summer months this ratio may be kept up until towards the moulting season, and then, as the hen is required to renew her coat of feathers, and lay too, the protein may be gradually increased until nearly 33 per cent is used, at the height of the moult, when the ratio may be as gradually reduced to the 20 per cent for winter again. Those who have tested this way of increasing the protein during the moult, claim that a good egg yield is possible, as well as a glossy coat of feathers.

To continue the protein too far into the spring months, invites early moult. That is, to continue more than the 20 per cent ratio demanded by nature, and if protein is to be with-held at any time of year, spring is that time.

A correspondent claims to study the seasons in this way and to be able to keep his flock up to the limit of profitable egg production all the year around, as well as to maintain a high fertility during the late fall months, and, in fact, the whole year.—Mrs. Metcalf.

Riverside has declared war on the English sparrow.

POULTRY QUERIES.

Diarrhoea.

Will you kindly give me some information regarding a disease among my chickens. They seem to have a diarrhoea, and become stupid and in a few days they die.

Your chickens seem to suffer from indigestion in some form, but unless we know more about the food and care we cannot advise definitely. Baking soda in the drinking water sometimes helps in cases of this sort, but a dose of castor oil or a pill would be more effective in the earlier stages, also a change of diet. Sometimes parched corn helps wonderfully. Too steady a diet on one kind of grain will cause this trouble, and too rich food will also cause it. Stimulating mashes are a prolific cause of it, and lack of grit and shell may be a cause. If lice or mites abound, the weakness resulting from the annoyance would cause it, so it is difficult to assign the reason without further facts.

Fits.

Will you kindly tell me what is the matter with my little chicks. They droop for a day perhaps, then seem to have fits. Their heads draw back and when touched seem to be in great pain and only live a short time. They have large range, plenty of green grass also alfalfa. I feed chick food, Egyptian corn; keep charcoal, grit and shells before them.—Mrs. L. A. B., Selma.

Musty food will cause symptoms of this kind, as would improper incubation, or injudiciously inbred parent stock, in rare cases. Poison may also be suspected very strongly, where chicks have large range, so if any spraying has been done to kill insects and the grass wet with it, they may have eaten some of that.

HOW TO USE HEN MANURE.

Hen manure, like Peruvian guano and all other fertilizers rich in ammonia, should not in its fresh undiluted state be permitted to come in immediate contact with the roots of plants, nor with the seed. The floor of the poultry house should be strewn with powdered muck, or woods earth, or land plaster to fix the ammonia and purify the atmosphere. Subsequently the manure should be composted before being applied to the field. Usually for vegetables it should be broadcasted nearly always applied in liquid form, and raked in. For greenhouse use, it has the tendency to "burn" if used to excess, and like all other nitrogenous manures produces leafage rather than bloom.

The dung of all domestic fowls and of birds generally has marked manurial properties on account of the large amounts of ammonia and phosphate contained. Hen manure could be successfully used for any greenhouse crop if composted with five times its amount of soil (or better, sods), and to every barrel of manure fifteen pounds of pure ground bone and five pounds of sulphate of potash, the whole to be cut down and well fined and mixed before using. The same could be used for vegetable growing in the hills, or could be simply mixed with enough dry earth plaster or rock phosphate to dry earth plaster or rock phosphate to dry it and be spread on the garden and harrowed in.

All greenhouse crops thrive equally well with the use of hen manure. For the purpose of watering plants the proportion of manure that may be mixed with water varies according to the sort of plant. About one ounce to two gallons of water may generally be used with safety; some plants will, however, bear a stronger solution.

An excellent plan of applying hen manure is to mix a portion with (in any case) several times its bulk of soil or garden refuse, and so form a fertilizing compost which may be applied to almost any garden crop with excellent results. Composts thus prepared become useful in two ways. The powerful properties of the manure become, when mixed with soil, partly absorbed by the latter and are thus rendered less harmful, and at the same time the decomposition of all the vegetable matter is hastened.

The quality of poultry manure to apply also depends somewhat on the nature of the soil. If broadcasted on the land and well worked in with harrow or rake, as much as 1,000 pounds per acre may be used. Damage from its use occurs mostly when applied to crops in hill or from lack of rain. We have never seen too much used. The difficulty has been that farmers use too little of that duplicate guano.

If the poultry droppings are collected daily, mixed with an equal bulk of dry dirt and stored in barrels, they will be in excellent condition for use in the garden when required. But the frequent admonition to keep them dry should not be followed. If allowed to become dry in the poultry house, portions soon reach an insoluble condition. If collected daily and kept somewhat damp, not wet, they will not lose ammonia, and will give better results when applied to the soil.—Rural Farmer.

HOW TO PLUCK CHICKENS.

Of course any housewife knows how to pluck chickens, but do they know how to prepare the birds so that they will be attractive to the eye (which counts much to the purchaser)? When a bird is plucked dry the poultryman will receive more per pound for the fowl than when it is scalded.

In picking dry, the breast should be plucked first, starting near the crop. After the breast the thighs, then the back near the base of the tail, and last the wings. As soon as the feathers have been removed the wings should be twisted over the back and the feet washed, after which the thighs and legs should be pressed to the body either by placing a brick on the bird's breast or by tying the bird, the object of this being to give the bird a plump or blocky appearance.

Any aged bird may be scalded without seriously injuring its quality if it is properly handled; but owing to the large number of poorly dressed scalded fowls the marketmen place a premium of from 1 to 2 cents a pound on dry-plucked stock. Boiling water may be used, but care must be taken not to leave young birds in the water too long, or the skin will cook, while with old fowl a little more time may not do any harm. The head and shanks should be kept out of the water, as the scalding will discolor them and make them unsightly.

Immediately after the bird is taken from the scalding water it should be dipped into cold water to stop the cooking, and, as poultrymen say, to "plump the bird." The bird should then be hung to a line with feet tied together, as no bird plucked on the lap or a table will have so good an appearance.

If a scalded bird is exposed to a draught when being plucked or when cooling, the skin is likely to harden and become tough. It is because of these possibilities that dry plucking is recommended by large raisers of poultry, as the condition of the skin to a great extent accounts for the high or low returns received.—The Farmer.

POULTRY FOODS

Special Dry
Chick Food

Makes Them Grow

Throw it out in the Litter and Make them Work

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequaled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the present high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed, to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE-SAVER. Write us for free samples and prices.

EGGS IN INCUBATOR NEED AIR.

One of our neighbors, who was hatching hen eggs in an incubator, took them out to air in a moderately warm room when they had been in the incubator 15 days. She got busy with her work and gorgot all about the eggs for over an hour. When she remembered them she thought of course they were all spoiled—chilled to death. But as they were so near hatching time she put them back into the incubator and got an extra good hatch of extra strong chicks.

Another woman had to move when the incubator had been running 14 days. She thought, of course, she would lose the eggs, but as it would not cost much, decided to move them. She lined two buckets with cloth, put the eggs into them and carried them half a mile. She put the incubator into a spring wagon, had it hauled to the new egg house, lighted it and put the eggs into it. She got an extra good hatch of extra strong chicks.

Give eggs from an incubator a good airing in a warm room from the fourteenth to the seventeenth day. I do so with good results.

Another woman had the usual instructions to keep the thermometer at 103, but happened to have a thermometer that had a long mark at 104. Without looking closely she thought that was meant for the right place. She kept the thermometer at 104 and above the first week before she discovered the mistake, but as the eggs seemed to be doing well she kept it there during the rest of the hatch. The result, an extra good hatch of extra strong chicks. She secured 93 chicks from 94 fertile eggs and raised 92 of them.

We only raise a few hundred chicks a year. We hatch in an incubator and raise in brooder in a brooder house. Feed mostly cracked corn and wet or damp bran, all they will eat. We used to feed dry bran, but one day I accidentally dropped some bran into the water pan. Awkwardness, of course. But the chicks seemed to think it was done on purpose. They gathered around it and ate it up in a hurry. I then gave them a dish of wet bran and they seemed to like it as well as a child likes candy. That settled the bran question. We now give them all the wet bran they will eat. And that means lots of it. They do well on it with what corn, ground pretty fine, or rather cracked fine, they will eat. But don't give them cornmeal unless it is baked, or the chicks will bake it in their crops. They must also have plenty of water all the time.—New England Homestead.

HOW TO SECURE FERTILE EGGS.

In order to secure a high per cent of fertility in the eggs that are to be hatched it is necessary that the stock be properly bred, reared, housed, fed, and mated.

One cannot expect eggs to hatch well from stock whose parents' eggs lacked in fertility for this trait is apt to be inherited. The ancestors of one's flock must have been strong vigorous birds whose vitality was never weakened by incessant laying or by colds or disease of any kind. They must have been well fed, well cared for, and kept in healthy surroundings.

The chickens must be properly reared to insure a high per cent of fertility in the eggs. Give each mother hen a dozen chicks and coop by herself. Have the coop with as much of the front open as possible for ventilation. Feed the chicks regularly five times daily on corn meal mash mixed with skimmed milk, cracked wheat, fine cracked corn, or any reliable chick feed on the market. Keep a supply of fresh water, grit, and charcoal where they can get it. Give plenty of free range and keep them growing.

When eight weeks old remove to open front colony houses, feed three times daily, wheat, barley, and cracked corn. Supply fresh water, grit, charcoal as before. Provide plenty of free range, and shade to protect them from the sun.

In the latter part of October move pullets and cockerels into winter quarters, allowing five to eight square feet of floor space to each fowl. The larger breeds require more room than the smaller varieties. Provide open front scratching sheds or remove windows during sunny days from closed houses. Supply an abundance of litter and make the hens work for nearly everything they get. Feed regularly wheat, oats, and corn, respectively at sunrise, noon, and an hour before sunset. Water, grit, charcoal, oyster shells should be always before them. Beef scraps, or fresh cut bone, and alfalfa or cut clover (the second crop is preferable) must be supplied once a day for meat and green foods respectively. Do not get the pullets to laying before they are fully developed or crowd them when they get to laying. Let the conditions be normal and the egg production will come as the natural evolution of the pullets' development. In February or March the breeding pens should be mated up. Select the male that is the champion over all the other males if you would be sure of his vigor. Select active females with plenty of vitality. Medium sized birds are preferable to small or large overgrown ones, other things being equal. Allow no more than a dozen females with a male, if the breed is of the American or Asiatic class and no more than twenty-five females to a male, if the breed is of the Mediteranean class. Health, life, constitution, and hardiness, must be taken into account in selection of the breeding pens.

Feed all hard grain, as much as they will pick up clean. With plenty of exercise, fresh air, oats, wheat, and corn, green and animal food, the eggs will be strongly fertilized and are bound to hatch well and produce strong rugged chicks.

So the secret of fertile eggs lies in approaching Nature as near as possible: First, in mating the breeding stock by selecting birds that are superior to their mates, thus following out the theory of evolution, "the survival of the fittest," second, in the rearing of the stock by natural methods, by having free range, using mother hens and open front coops and houses that approach out door conditions; third, in winter quarters by using houses and sheds that allow the largest amount of exercise and fresh air without impairing the health of the flock; fourth, in taking into consideration the natural laws of heredity in the selection of breeding stock whose progenitors have been productive in the matter of fertility.—Successful Poultry Journal.

KEEPING EGGS FOR HATCHING.

The claim that if an egg contains a very strong germ it may be held over two or three weeks before setting without deterioration is a poor rule to cling to. In the first place there is no known way to determine the vigor of a germ; some eggs in every clutch always being weak. Highly vital hens with vigorous mates ought to produce strong germs, but all hens have their off days and so it is not safe to assume that the germ is strong. Again the hatchability of an egg depends as much on where and how it is kept on its original quality. If kept at a temperature of about 50 with atmosphere not too dry and if turned regularly twice a day to prevent the germ sticking to the shell the deterioration will be slow but as eggs are usually kept in the temperature of an ordinary dwelling house in which artificial heat has made the air hungry for moisture the drying out process is rapid; and in such an egg when incubation commences the chick will grow too fast, will crowd the shell and probably be unable to make the necessary muscular exertions at birth for want of space. Many fully feathered chicks are found in shells that do not pip and almost without exception is it found that the moisture had evaporated too rapidly, causing them to overgrow.—Farm Stock and Home.

The feed and drinking vessels of poultry should be frequently washed out with scalding water. One advantage of using hot water for disinfecting purposes is that it is non-poisonous and does not produce any bad after effects. Cleanliness is one of the secrets of success with poultry.

One of the most important details in building a poultry house is to arrange the doors and windows in relation to the perches in such a manner as to prevent the least draught

AN ADVERTISING ANNIVERSARY.

The firm of N. W. Ayer & Son, of Philadelphia, the largest advertising agency in the country, celebrated yesterday by a dinner at the Bellevue-Stratford the fortieth anniversary of the founding of the firm on April 1, 1869. Ayer & Son state that they have more faith in advertising today than ever before. Looking backward, they see hundreds of business men who a few years ago said, "Advertising would do me no good," but who today are using it regularly and profitably. Looking forward, they see hundreds more who will either have to adopt this modern trade-building method or see their business go to more enterprising and progressive competitors.

California Farm Names

As promised our readers, we give herewith instructions received from Secretary of State Curry through his deputy, Mr. H. C. Waring, regarding the securing of trade mark privilege for farm names. From Mr. Waring's letter we quote:

"In accordance with your request, I enclose blank form for filing Claim to Trade Mark under Sections 3196 and 3196b of the Political Code of Cal. (In effect May 7, 1909). This office will not have a special form for this class of Trade Mark, but will have the general form made to fit this new kind of Trade Mark as well as the others. The enclosed will show what facts should be stated. Those desiring to file need not get blanks printed by this office, but should follow the enclosed in drawing up their Claims to Trade Mark.

"As to the purpose of these new sections, it appears that they were enacted to make farms and their products the objects of trade mark the same as goods imported, manufactured, produced, compounded or sold by any mechanic, manufacturer, druggist, merchant, or tradesman is made the objects of trade mark by Sec. 3196 of Pol. Code. In other words Sec. 3196 seems to specifically mention the particular callings that are entitled to have their goods protected by trade mark without mentioning farming. These two new sections are no doubt added for this purpose. Hon. L. H. Wilson, of Winters, Cal., introduced this measure in the Assembly and he could likely tell you the exact object it is intended to cover, if this reason given be not the correct one. Fee for filing a Trade Mark is $5.00."

We fear this plan will dissappoint many of our subscribers, that is, the fee of $5 required is more than many will wish to pay for simply protecting the farm name when it is largely for sentimental reasons, however, there is no harm done in the act and nothing prevents those who still wish to select a name for their farm from fixing upon such a name.

From farm names received this week we have the following:

"Alberta Orange Grove," owner, A. E. Rudell, Rialto, San Bernardino county. In writing in his farm name, Mr. Rudell wishes to know the address of proper party to file application with for farm names. This is given above.

"Moen Ranch," owner, E. O. Eggin, Hemet, Riverside county. Mr. Eggin says that he has made application to the Secretary of State for the registration of this name and adds "Moen is a very common farm name in Norway where every farm has a name and is recorded and taxed under such name. "Moen" means a piece of flat or level land. My farm or ranch is situated 2¾ miles southeast of Hemet and is covered by Lake Hemet water certificates."

"The Oaks," owner, F. M. Leasure, Tulare county. Mr. Leasure writes: "Our place is one mile west of Tulare on the Hanford road. I will mention a freak which we have which will probably be of interest to your readers. I have an 8½ months Jersey calf which is now giving three-quarters of a pint of milk each day."

Mr. Joseph Thorndike of Pasadena writes that he is much interested in the farm names and the registration of these and wishes information as to action to take to secure the protection. That is given above.

"Myrtlehurst," owner, Mrs. Alfred J. McClatchie, Montebello, Los Angeles county. Mrs. McClatchie is the widow of the late Prof. Alfred J. McClatchie who wrote "Eucalypts Cultivated in United States," issued by the Bureau of Forrestry, Department of Agriculture in 1902. Prof. McClatchie was also the author of many bulletins issued by the Arizona Experiment Station with which he was connected several years. The bulletin on Eucalypts, known as number 35, is unfortunately now out of print, but it is the most complete work which has yet been issued on this popular tree.

When Prof. McClatchie died, Mrs. McClatchie bravely took up the work of preserving the little ranch at Montebello, which is just without the outskirts of the city of Los Angeles. Prior to moving to Montebello, the family had a small ranch at Gardena which it was anticipated would be planted almost entirely to Eucalyptus, the work amongst which the Professor had spent much of his life. Naturally, the Professor wished a name which would honor his loved tree, so he chose Myrtlewood. Mrs. McClatchie now wishes to honor the Montebello home with a similar name so chooses Myrtlehurst. The eucalyptus belong to the myrtle family.

THE COUNTRY IS BETTER.

Replying to a request of the Spokesman Review for his sentiment as to the opportunities of country life as compared with city life, ex-Governor Geo. C. Pardee wrote:

"In reply to your request for a word of encouragement to the Country Life Booster club, that, in my judgement, the fact that almost every city dweller wants to live in the country, is proof that the country is better than the city as a dwelling place.

"Nowadays, with the telephone, the free rural mail delivery and the ability, by means of irrigation, to make a comfortable living from a few acres of land, the country is not isolated as it formerly was from all the activities of life which the young so ardently crave. Schoolhouses are becoming so plentiful in the country that it is only in exceptional cases that the children have to make long journeys to attend them.

"Small farms make compact communities, so that the country dwellers are able to hold easy communication with each other, and the results of intensive curtivation are becoming so remunerative that it is no longer necessary to go to the city to gain a comfortable livelihood.

"Finally, the country boy who goes to the city without an opportunity to get into some business or profession, leaves a good thing to plunge into a bad one. There are already too many hard-worked, poorly-paid street car men and the like in the cities, with no hope of bettering their condition."

GEORGE C. PARDEE."

SELECTING THE FARM GASOLINE ENGINE.

At present there is a great demand for the gasoline engine on the farm. There are many things that can profitably be done with it. It is the most desirable type of engine now found on the market for the farmer's use.

The farmer who is about to buy a gasoline engine does not always know exactly what he wants. Many questions naturally arise in his mind as to the make of engine to buy, the size, type, kind of cooling device, and the various other points of selection. He has probably read the catalogs and advertising matter of from one to twenty different engine companies, and knows less about what he wants after reading this matter than he did before. The prospective purchaser cannot depend too much on some of this advertising matter, as many of the claims are extravagant and unreliable. It is true that the advertising put out by the standard companies can usually be depended upon; but it is not always just what the farmer wants to aid him in making an intelligent selection of his engine.

The buyer should have some ideas of his own, and should select his engine according to requirements and conditions. He should not correspond too much with unreliable firms, and especially with those companies that put out cheap engines. The engine that is bought by correspondence usually does not have a representative in the same state as that in which the engine may be placed, and consequently there is no one to show the buyer how to operate the new engine. He must depend entirely upon the printed directions, or perhaps upon a catalog for his information.

The engine should be secured from some reliable firm that has a representative in a nearby town. Then, in case an expert is needed, or repairs must be secured, either may be easily obtained on short notice. The recommended type of engine is one which is well constructed from good material and is manufactured by a company that stands responsible for its success.

The engine of standard and reliable make may be somewhat more expensive in first cost than some of the other makes, but it will give better satisfaction and is cheaper in the end.

The gasoline engine should not be a complicated machine, but rather of simple design, with as few parts as possible. It should be so constructed as to be easily adjusted and kept in repair. The wearing parts, bearings, and small parts should be well constructed. Select the engine for simplicity, reliability, durability, and, lastly, but not least, for economy of fuel consumed.

A good farm engine should be able to run on not over one pint of gasoline per horse power for each hour. According to this, a two horsepower engine would require one quart of gasoline for each hour of work. An engine must have good compression in order to be economical in fuel. The mixer should require no regulating for the air. When the gasoline has been turned on and the engine is started, the air should feed without regulation.

Of all the methods of cooling the gasoline engine cylinder, the water-cooling method must be considered superior.

Select an engine with a good sparking device and then always use a good battery with it, and one of the greatest sources of difficult operation will have been largely overcome. The small dynamo or magneto is very successfully used in the place of a battery. The dynamo is more expensive than the battery in first cost, but it lasts very much longer and always insures a good spark.—H. M. Bainer, Colorado Agricultural College.

An Injury to Irrigation Interests.
Lands which have been over grazed, encouraged washing and injury. to land as well as to orchard interests below.

DESERT WATERING PLACES.

THE southwestern part of the Great Basin—that portion of it including the arid areas of southeastern California and those of Nevada that are most easily reached from California points—is known generally to the dwellers in the less arid districts west of the Sierra as "the desert," but local names are applied to its various subdivisions. The most important of the subdivisions are the Colorado and Mohave deserts and the Death Valley region. The Colorado Desert extends from San Gorgonio Pass southward to the Gulf of California and includes the depression known as the "Salton Sink." The Mohave Desert lies farther north and its boundaries are not so definite, but it includes much the greater part of San Bernardino county and the eastern portions of Los Angeles and Kern counties, Cal. The Death Valley region, which lies north of Mohave Desert, stretches eastward from the Sierra Nevada, covering a large part of Inyo county, Cal., and extending into Nevada. It is named from its central feature, Death Valley, the lowest point on the continent.

Resources of the Desert.

At the present time public interest in this desert region, which comprises an area of about 68,000 square miles, is intense, largely because of the discovery and development within it of mines that are heavy producers of gold. The resources of the desert, however, are not confined to the precious metals but include a wide range of products of economic value, among which may be mentioned several valuable salts, including borax, soda, gypsum, and common salt; building material, including marble, onyx, brick clays, and cements; baser metals, like copper, iron, and lead; and gems, among which are turquoise and opal. These products are widely distributed throughout the desert counties, and although the existence of some of them in commercial quantities and available form is as yet problematic, others already form the basis of important industries.

Wells and Springs.

The wells and springs of the desert region are few in number and very irregularly distributed—so irregularly, indeed, that while in some districts watering places occur in groups, in others they are 30 to 50 miles apart. Unusual activity in railroad work has so stimulated prospecting that there is a large influx of strangers, many of whom do not fully realize the danger of traveling through an arid region, and it is highly important that the springs and other watering places should be located as definitely as possible and described for the benefit of prospectors and other travelers. It is believed that this urgent need for the dissemination of information in regard to the location of known watering places and the possibility of locating and developing water at other favorable points will be met in part by a report by Gilbert E. Bailey, which has just been issued by the United States Geological Survey as Water-Supply Paper 224.

For many years Mr. Bailey was obliged to travel repeatedly many of the main desert roads and trails, and the information presented in his report was in the beginning intended for his personal use. The author's acquaintance with some of the desert districts is necessarily more intimate than with others, and the records are therefore by no means complete nor are they of uniform value, but it is believed that on the whole fairly adequate and accurate descriptions are given of most of the better known and more accessible springs and wells, and that many of those that are less well known are included. More than 300 watering places are described and mapped, and the map shows also a number of the principal roads through the desert. These roads have not been surveyed and only approximate locations are possible, but the map at least indicates the usual routes of travel.

A copy of Mr. Bailey's report can be obtained on application to the Director, Geological Survey, Washington, D. C.

Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Irrigating Ditch Right.

An irrigating ditch has run across my land for something like twenty years or more. No right was granted or shows on record in any manner. Please tell me what right they have to maintain the ditch. How much land can they claim on each side of the ditch. Can they clear the ditch, or dig it deeper and throw the material on my crops?—Subscriber, Arroyo Grande.

If the party who placed the ditch upon the land, or his successors, has claimed the right to have it there adversely to the owner of the land, the time has certainly been long enough to vest the title in such person or persons. They have no right to any land on either side of the ditch, but would have the right to enter upon your land to maintain the ditch in proper repair, but not to damage your crops by throwing material from the ditch upon them, or in any other way. They have no right to make the ditch larger or deeper than is necessary to carry the quantity of water that has ordinarily been carried.—E. L. P.

Storm Water Damage.

My land is bottom land. My neighbors above, this winter, made ditches to drain some land, in place of letting the water seep through the grass. Because of these ditches the water rushed on to my land, and damaged me by washing a ditch clear across my bottom land about eight feet deep and thirty feet wide when the heavy rains came on. What can I do?

You have a right of action for damages against those who caused the trouble, for, as I have repeatedly said, one may not turn waste water onto his neighbor's land to his neighbor's damage.—E. L. P.

Drainage District.

In case we organize a drainage district, do we pay on the land we hold or the land drained?

Section 9 of an act to promote drainage, as amended February 19th, 1909, provides as follows: "Such commissioners must view and assess upon the lands situated in the district a charge proportionate to the whole expense, and to the benefit which will result from such work, which charges must be collected and paid into the county treasury, either in cash or in regularly issued warrants of the district as hereinafter provided, and must be placed by the treasurer to the credit of the district and paid out for the work of drainage upon the warrants of the trustees approved by the Board of Supervisors of the county."—E. L. P.

Right of Way.

1. A sells one-half of farm to B; B buys water stock. The ditch right of water company was to the beginning of A's place. Can the company cut a ditch through A's place for B to irrigate? 2. Can A make B or company pay for right of way? 3. C is at the other side of A's place. Can C irrigate by that same ditch by cuttng holes through fence, when C has box gate so that water can go onto his farm; also other ways of irrigation. 4. Can the company build the ditch higher than it is necessary for A and B, so that C can irrigate? 5. If the company has no right to use the ditch, what can A do to stop it? 6. Can A open C's gate to let water in so as to get water out of ditch?—Subscriber.

1. The Water Company might condemn a right of way for a ditch, but could not make the ditch without A's consent or legal proceedings. 2. A has a right to compensation for the land taken in making the ditch, and for the damage done, in constructing the ditch, to the balance of A's land. 3. C has no right to damage A's fence in order to obtain water from the ditch, nor to go onto A's land for that purpose. 4. The ditch being on A's land, A might recover damage if any were caused by building the ditch higher than necessary for his own use, or possibly, if the injury caused was of sufficient gravity, the raising of the ditch might be enjoined; so far as B is concerned so long as he could conveniently obtain the water necessary his rights would not be involved in the raising of the ditch. 5. Remove the ditch or enjoin its use, provided the other circumstance warrant an injunction. 6. If the gate is on C's land, A has no right to trespass upon the land to open the gate.—E. L. P.

Clean-up day has become popular in nearly all the towns in Eastern Washington in what is known as the Inland Empire.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Motor Velocipede.

Where can I get such a thing as a motor velocipede? I think there must be a great many others who want what I want, for I notice that even women with husbands and horses often can't get the team when they would like to go some place.

And it practically makes the difference in the choice of a location, forcing us to crowd in nearer town than we wish to be, if we have to do all our going on foot and carry our parcels.

Can you or any of your readers suggest something?

Perhaps it is needless to state that our roads are far from good. A harmless little toy automobile that would go about as fast as a horse and carry 200 pounds or so would appeal to us.—A. R., Arroyo Grande.

It is possible the suggestion may be a good one, but we fear many of our fair readers would find difficulty in keeping the velocipede or motorcycles in good condition. The mechanicism requires understanding of such things and they are most perplexing however. Perhaps other farm readers may have some suggestions. To us it appears that a pony cart would be less complicated and require less attention to the "sparker" than will the ordinary "horseless." The pony would have this advantage that

would be of no value in farm work so that the head of the ranch would not be tempted to use with the larger team, besides the pony has the advantage of costing but little for feed. A motorcycle can be bought from any automobile firm. We take it however that A. R. wishes something which will stand alone.

Cut Worms.

Cut worms are infesting my potato patch, how may I control them?—J. W. H., Los Angeles.

Probably the best method of handling the worms is by placing near the plants wisps of green alfalfa over which paris green has been scattered or the alfalfa may be dipped in liquid poisons. If the poison plan is used a little sweetened water may be used with bran to form a mash and in it stir a small quantity of paris green or arsenic. A small quantity of this should be left near the base of each hill of potatoes. If worms are marching in from the outside, then a furrow laid around the potatoes will protect them from further encroachments. If the field is small, scattering of ashes or slaked lime or of even dry road dust around the hill is very distasteful to the worms. A formula sometimes used for cut worms is made as follows: 40 pounds bran, 2 gallons cheap molasses and 5 pounds arsenic. Stir all thoroughly. Its effectiveness is continued longer if cheap glycerine is added to hold in a moist form. A spoonful of this is placed near the base of each plant.

Red Spider.

What is the best remedy for Red Spider on almond trees?—F. G., Lancaster.

A good remedy for red spider is the ordinary dry flowers of sulphur thrown or sprayed in a dust through the trees. This is usually sufficient. Some prefer, however, the sulphide of potash spray. The following is taken from "California Fruits" and is made as follows: Granulated or powdered concentrated lye—15 pounds, sulphur—18 pounds, add water to make 20 gallons. Stir sulphur and lye together in a vessel which will allow plenty of room for boiling. When well mixed, add about a pint of water and stir slowly. This mixture will soon melt and boil, forming a red liquid. Stir until boiling ceases, then add water to make 20 gallons.

However, any treatment of red spider should be made before the work of the spider is visible to the eye.

Fertilizer for Beans.

What is the best commercial fertilizer for string beans? How many pounds should be used to a acre?—Subscriber, Orange.

The best treatment to give ground for growing string beans would be to apply anywhere up to 25 tons of stable manure per acre the season before planting. This worked in the soil at that time would have it in excellent condition by the time the beans were planted. This may be had for about $3 per ton. However, as Subscriber asked as to commercial fertilizer, we imagine that application of, say, 100 pounds per acre of nitrate of soda would give the quickest results. This would cost $3 or $4 per acre. The application of stable manure would be much more expensive, but would put the ground in much better condition.

Aphis.

I am sending you specimens of leaves from apple trees. They are infested with bugs or lice which causes them to curl and look unhealthy. What will destroy these insects?—Subscriber, Capay.

There were no live insects on the leaves when they arrived and, in fact, the dead ones had been more or less mashed in the letter, but indications were that the leaves had been infested with apis or plant lice, a small green bug which attacks the more tender growth of nearly all plant life. They are easily destroyed, but so wonderfully productive that a new crop comes on soon and infects the plant again. Knocking the lice from the growth with water under strong pressure is sufficient to kill most of them. However, the usual remedy is kerosene, emulsion or whale oil soap spray.

Perris.

What kind of a country is it about Perris, Riverside county? What is good land worth there? What crops do well? How many miles is it to Los Angeles? How many acres will keep a family?—J. D. O., Arroyo Grande.

Perris is located on a level body of land east of Riverside, a few miles, and has a general elevation of about 1500 feet. The soil is generally good and where water may be obtained for it will produce most of the crops which will do well in California. There are some excellent orange groves in the section. The country is, as a rule, given to grain growing. It is 85 miles from Los Angeles. The number of acres to support the family depends upon the size and requirements of the family, the amount of water secured, on the intelligence of the man who is doing the farming and on so many other factors that it is impossible to give a satisfactory answer to this question.

Beer Seed.

I noticed in your issue of the 8th that a subscriber wishes to know the name of a plant that is used to make beer. I do not know the plant, but I have seen a plant which was used to make "cider." I presume it is the same plant. I think if the enquirer

Renting Land on Shares.

"In renting a peach orchard on shares, what percentage of the collections does the owner receive. What are some of the more important stipulations usually used in a lease of this description?"—"ABC"

It is impossible to get information on this line which will be of any value as there is so much diversity of practice in the matter, made necessary by differing conditions, that without knowing fullest particulars it would be impossible for one to give any advice and even then local surroundings, distance to market, condition of the trees and so many other points would control, that definite information would be impossible. Shares usually vary from one-quarter to one-half.

Beans on Alkali.

Would you advise planting pink beans on land that is partly alkali spotted and will they grow as fast as white Egyptian corn? I have a piece of land planted to peach trees this spring and would also like to plant it to some kind of beans. Please tell me a good market for black eye beans and do you know of a commission house, or any concern that makes contract for crops on the vine or trees.—F. R., Visalia, Cal.

The pink bean will do as well as the black eye. They are practically the same as to tolerance of alkali and probably will do as well as the peach trees.

We know of no commission house which will contract for a crop in advance. They prefer, as a rule, to wait until the crop is ready for marketing and then play the producer as best then can to get the best end of the bargain.

Green Manure.

Would it be profitable to try to raise a green manure crop in my orchard, where I have no irrigation and the rains do not come generally before December? If so, what would be the best to raise. It would have but about three months to grow if I plowed the first of March. The rainfall is about twenty-five inches and comes in December, January, February and March.—C. A. S., Chico, Cal.

Yes, we believe it would pay under these conditions to grow a cover crop, probably the best under these circumstances would be the ordinary Canadian field pea. If in the ground so as to take advantage of the first rains they will probably be ready for plowing under by the first of March.

Swine Questions.

1. Is it practicable to silo alfalfa in this country? 2. Does it keep well? 3. Will stock hogs eat it and keep up? 4. Or is it better to grind the dry alfalfa hay in to meal and feed? 5. Will hogs do as well to cut the alfalfa green in summer and feed it say twice a day in close pens as they will to pasture it? In my neighborhood we can only pasture hogs about 5 or 6 months in the year as it dries up in fall. 6. Is there any way to keep the hogs on the alfalfa the remaining part of the year?—S. S. B.

1. Yes. 2. Perfectly, if made moist by addition of abundant amount of water. 3. Yes, it is good hog feed, but we give them alfalfa hay or pumpkins at the same time. 4. The expense of grinding alfalfa hay is needless. The pigs will eat it fully as well unground. The process of grinding in the machine consists of drying out the hay until brittle, then putting it into a perforated drum that revolves rapidly; the ground up portions are forced out and sacked up. The other form of making the meal consists of chopping and chopping until it is fine enough to drop through a small mesh and be carried away on a traveling draper to the sacking machine. This makes the machine too expensive to be operated on the farm without a large amount should be made to sell to others. 5. Certainly, only give them a small lot or else keep the pens clean by white washing them every two weeks and cleaning up the floors every other day. Sand thrown in will become valuable fertilizing material to put on the land. The cheapest way to feed the stock hogs in the winter is to use good leafy alfalfa hay with either pumpkins or pig melons during the season the pastures are too dry to be grazed.—M. E. S.

Sulphuring Grapes.

I have a couple of acres of grape vines, Thompson Seedless, Muscats and Red Emperor. Part set out last spring and part this spring (rootings). Will it be advisable for me to sulphur them; if so, how?—W. D. R.

A little dusting over of sulphur would not be amiss for mildew. When it once starts enough to show its work it has completed its mischief. On a small plot the sulphuring may be done by shaking the sulphur through a piece of gunny sack or a Vilomorin or Julian knapsack sulphur machine may be bought at a cost of $12.00 to $15.00. Sulphur is put on in the morning while the vines are damp from the moisture of the night time. Buy sulphur that is smooth and velvety to the touch when rubbed into the palm of the hand.—M. E. S.

Green Manure Crop.

Your advice on cover crop is O. K. providing it gets plowed under early and before it becomes woody, but may Heaven pity the man who does not get it under early, especially if it is heavy. I speak from experience.—C. L. G., San Diego, Cal.

This experience will cause a responsive cord to throb in the breasts of many who have been caught the same way. Moral—plow under early.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Scours—Worms.

I have a yearling colt that has the scours almost continually for several months, even before green feed came on. Is there any treatment useful or needed?—S. G., Inglewood, Cal.

It is quite likely the colt has worms. At least I would give the following:

Aloin ½ ounce.
Raw Linseed Oil 1 pint.
Turpentine 30 ounces.

Mix and give in one dose.—R. T. W.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

MOSQUITOES.

LATITUDE does not seem to be an important factor in influencing the numbers of the pest, for they may be found in the cold latitudes of the North equally as well as in the tropics.

The wonderfully economic bearing that certain species of mosquitoes possess was brought to light a few years ago when it was discovered that certain diseases of the human system were not possible unless inoculation of the patient with the organisms causing the disease first took place by the bite of a mosquito. It was known that malaria, a disease so much dreaded in the South, bore a certain relation to the swamps, and it was at first supposed to be the result of a certain miasma arising from them. When it was determined, beyond the shadow of a doubt, that malaria could not possibly be contracted in the human system without first an Anopholes mosquito biting the patient, the medical world was somewhat relieved of one of its many problems, and the problem of stamping out malaria became more the problem of the entomologist. The most vulnerable point of attack was the swamp. By killing the mosquitoes that bred therein much good could be done toward relieving the distress caused by malaria.

It was also found that yellow fever is contracted after inoculation from the bite of a certain species of mosquito, and a way was opened for lessening the ravages of that disease.

The female mosquitoes live over as adults and in the spring lay their eggs, on stagnant water, in little boat-shaped masses. The little larvae, commonly called wrigglers, in a few days hatch from the eggs and feed upon small organisms in the water for a period of two weeks, sometimes more and sometimes less, depending upon the food supply. While living in the water it is necessary for the little wrigglers to breathe. This is accomplished by means of a little tube-like organ on the anal extremity of the body, which is pushed above the surface film of the water. When the larvae become full grown they change into the pupal stage. During this stage they are still active, but do not partake of any food. In a few days the skin splits down the back and the winged adult emerges, uses the shed skin as a raft upon the water until its wings are strong enough so that it may fly away. It is only the female mosquitoes that need concern us, for the males do not bite. Upon emerging from the water the females hunt some animal, and if none is found they may partake of vegetable juices for a time. The life of the female mosquito is quite short, probably not more than two weeks on an average.

The fact that three stages of the life of the mosquito are spent in the water is favorable to their destruction. Oil poured on the surface of an infested pool will kill the larvae and pupae as they come to the surface to breathe. The egg masses will also be penetrated by the oil and killed. If a neighborhood is infested with mosquitoes, it is well to make an investigation and determine, if possible, where they are breeding. Often the water in a rain barrel, or even water in tin cans will serve as a breeding place to such an extent that a whole neighborhood may be infested. The emptying of such vessels, or the covering of them so that the adults cannot get in to deposit their eggs will result in great good. The drainage of pools and swampy places is an effective means of control. In the state of New Jersey the salt marshes along the coast were found to be breeding places for an abundance of mosquitoes which infested the region for some distance inland. A state appropriation was made to be used in draining these marshes, with the result that the salt marsh species of mosquito is no longer abundant.

The point to bear in mind in mosquito control is that they breed in water, the fouler the better, and that by destroying all such breeding places great good may be accomplished.—Geo. P. Weldon, Field Entomologist, Colorado Agricultural Experiment Station.

DODDER.

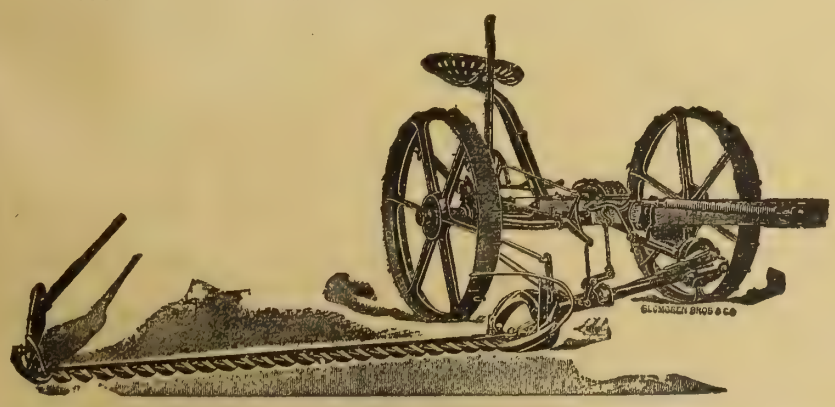
This annual parasite is easily recognised by its slender, twining, yellowish-green, practically leafless stems attached by minute suckers to the host plant, and bearing clusters of whitish or pinkish flowers. It is as great a pest to agriculture as the Mistletoe is to forestry. Two native species (Cuscuta tasmanicia, Engel, and C. australis, R. Br.) are known and have played some part in keeping down native and introduced weeds (St. John's Wort). The most injurious Dodders appear to be the introduced ones (Cuscuta epithymum, Murr., C. europaea, L., C. trifolia, Bab., etc.) which are continually imported and spread by seed. These parasites will destroy any leguminous crop if unchecked. Where a whole field is infested the entire crop should be plowed under, and if this is done before much seed has been formed, after a years' allowing (bare or green), followed by wheat, oats, maize or a similar crop, it will be safe to use the land for clover, lucerne or leguminous crops. If allowed to seed freely the seed in the soil may not be exhausted for five or six years.

When small infested patches are found, a trench should be dug round the patch over which straw or long chaff sprinkled with kerosene has been spread. After firing and burning off, the soil can be thrown over the quarantined area, covering and burning any parts that have escaped destruction. It is wise not to remove the infested plants for burning as pieces left on the field or dropped in fresh places re-establish themselves and spread the evil. To attempt to tear out the dodder with a rake is even more foolish. Spraying with copper sulphate or iron sulphate solutions have been recommended, but a badly infested crop cannot be saved in this or any other way. It is better to lose completely a small area of the crop by burning than to risk a

A FRICTION STORY

A small boy can slide faster down a smooth, greased board than he can down an ungreased board full of slivers.

MORAL: A mower which comes closest to eliminating friction will require the least power to operate.



The Cutter Bar is curved when raised, so as to be mathematically straight, to form a frictionless channel for the knife, when lowered. This Bar is patented and can be used only on the New Standard Mower.

The entire weight of the Cutter Bar is transferred through the Suspension Spring to the main wheels. The bar is carried—overcoming the friction of a dragging bar which is pulled or pushed on the ground.

Steel Rollers and Steel Balls surround the main shaft and pitman shaft.

The New Standard Mower develops more cutting power from its special high speed gearing and the grip of the main wheels on the ground than is developed in any other mower—although less power is required to operate it on account of absence of friction.

A folder giving full detailed description of the New Standard Mower and our other Haying Tools will be mailed free on application.

ORCHARD HOMES FOR SALE—FIVE acres and upwards; fine citrus and deciduous fruit lands on easy installments and low interest. Write us today. WYATT & WILSON, Winters, Cal.

FOR SALE—TULARE CITRUS BELT right here at Exeter, small tracts, small payments, terms, our home 52 years, also dairy ranches. FRED M. HART, Hanford, Cal.

I MAKE A SPECIALTY OF ORANGE and alfalfa ranches and exchanges. 826 Main St., Room 9, Riverside, Cal. N. R. BELL.

SEED.

FOR SALE—CALIFORNIA BLACK walnut seed in sack lots. Wanted: Mayette, Franquette and Parisienne Walnut scions, also Rupestris St. George, Rip. x Cord. x Rup. 106-8, Rip. x Rup. 3306 and 3309 cuttings, grafting size. Address FANCHER CREEK NURSERIES, Fresno, Cal.

FOR SALE—ORANGE SEED SELECTED from choice groves, can supply any quantity at reasonable prices. K. W. LATTIN, 20 West 4th St., Alhambra, Cal.

HORSES.

FOR SALE—ABOUT 200 HEAD OF work and brood mares, including young mules and horses from one year to four years of age. One full blooded Percheron Stallion four years old in May. One Jack about seven years old. Several full blooded Poll Angus Bulls and a number of full blooded Durhams. CHAS. W. HART, Farmersville, Cal.

FERTILIZERS.

NOW IS THE TIME
to fertilize for results in the coming crop.
ARMOUR'S "O.T.M.", "B.B.&P.", and "5-8-2" grow big crops and build up the soil. They have been doing it for years.
THE ARMOUR FERTILIZER WORKS, Los Angeles, Cal.

HAND FERTILIZER DROPPER, drops exact amount wanted each hill. No waste. Circulars. Agents wanted. FITZ RANDOLPH'S SON CO., East Orange, N. J.

ARTICHOKES.

FOR SALE—JERUSALEM ARTICHOKES, the great winter hog feed. Address, FANCHER CREEK NURSERIES, Fresno, Cal.

HOGS.

REGISTERED BERKSHIRE AND POland China hogs, both sexes. C. A. STOWE, Stockton, Cal

GRAPE CUTTINGS.

STRONG OUT DOOR GROWN ROOTED cuttings. All kinds of plants. Send for 1, 2, 3c list. GEM NURSERY, Los Gatos, Cal.

MECHANICAL ENGINEER.

GAS PLANTS FOR LIGHITNG, COOKing and heating installed complete in private homes. Estimates furnished and expert advice given. R. WALTER WILSON, 1022 E. 49th St., Los Angeles, Cal.

SWEET POTATOES.

FOR SALE—YELLOW SWEET POtato plants. J. W. BROWN, Home Phone 643, Downey, Cal.

HELP WANTED.

A BEE MAN WANTED—THE USUAL wages paid and board furnished. About 300 stands. Address immediately, Box 695, Wasco, Kern Co., Cal.

POULTRY

BARRED ROCKS, RINGLET STRAIN, direct from the famous E. B. Thompson pens, New York. Have taken more prizes than any other Rocks at The Madison Square Garden Shows. For beauty, size and laying quality, unequaled. Eggs per setting $1.50 and up. Reduced rates on incubator lots. Special matings. $3.00 per setting of 15; 2 settings $5. Agent for The Potter System of Selecting the Laying Hen. Price $1.00. A. C. CISSELL, 1812 Santa Monica Ave., Los Angeles, Colegrove car to Swan street.

M. E. DILLINGHAM, SAN GABRIEL, Cal., is selling out: About 20 golden Seabright Bantams, $2.50 per pair; 7 pairs Black Tail Japs, $2.50 per pair, all Partridge Cochine Bantams same price; 1 trio Black Breasted Red Game Bantams, $3.00; Buff Cochin Bantams, $2.50 and up per pair; and also 1 pen White Wyandottes, 1 male and 10 pullets, $12.00.

SILVER CAMPINES, GREAT LAYers, non-sitters, beautiful fowls, splendid foragers. Recently imported from Belgium. Eggs for hatching $3.50 per doz. Write for circulars. E. SMITH, 3527 Dauphin St., Los Angeles, Cal.

BLACK MINORCAS—FINEST QUALity. Bred to lay big white eggs and up to standard size. Eggs $1.50 to $3.00 setting. Grand Cockerels reasonable. J. P. McDONOUGH, Geyserville, Cal.

BUFF PLYMOUTH ROCKS, BRED TO lay, win and pay. My birds have won more prizes than all competitors combined. Eggs and stock. Circular, DR. W. H. HOLMES, Slavin Block, Pasadena, Cal.

BUFF ORPINGTONS — THOROUGHbred and first prize stock and eggs for sale. Will sell pens, trios, etc., at special rates. I am closing out to quit business. E. G. WALL, 1920 Monticello Ave., Hollywood, Cal. Phone 59829.

WHITE MINORCAS (EXCLUSIVELY), standard bred, prolific layers, large white eggs. Eggs (after April 1st) $1.25 for 15; $3.00 for 45; $5.00 for 100. L. V. PETERSON, Guerneville, Cal.

MAMMOTH BRONZE TURKEYS — Eggs fifty cents each. None in West larger or finer marked. Laid by old hens. MRS. LAURA E. HARDING, Brawley, Cal.

WHITE MINORCA EGGS FOR hatching, $5.00 per 100 after March 15. Some prize winners. MRS. E. BANTA, Calistoga, Cal.

PRIZE - WINNING WHITE MINORCAS. Eggs for setting, $2 for 15; $3 for 30; $6 per hundred, f.o.b. express. C. S. LANE, Santa Barbara, Cal.

S. C. BROWN LEGHORN EGGS $1.50, $2.50 and $5.00 per setting, $5.00 and $7.00 per 100. MRS. C. H. VARY, Pomona, Los Angeles Co., Cal.

O. L. CRANE, BREEDER OF PIT AND Cornish Indian Games. Rural No. 3, Santa Rosa, Cal.

TREES.

FOR SALE—300 FIRST CLASS NAVEL orange trees, ½ to ¾ inches in diameter at $1.25 each and 1,000 Eureka lemon, ¾ to 1⅛ inches in diameter at $1.10 each, if taken soon. Balled and sacked at nursery. Shipping expenses paid by purchaser. SANTIAGO FROSTLESS NURSERY, Santa Ana, Cal. R. D. 1, Telephone Sunset, Orange 354.

FOR SALE—A NICE LOT OF 2 YEAR Late Valencia trees, 150 Washington Navels, 80 lemon trees. Must apply at once as they will be sold at once, being an extra lot of trees. RIMPAU BROS., Anaheim, Cal.

DAIRY FOR SALE.

FOR SALE—A DAIRY. THE ONLY first class, modern, up to date dairy and milk route in the city of Los Angeles. This milk is sold at a premium, sixty head of A 1 young dairy cows, the cream of 15 years of careful choosing and retail route. 2 horses, 2 mules, 2 wagons, and other appurtenances necessary to make up a modern dairy. Here is your chance. This stock, if not sold at private sale by the 20th day of May, 1909, will be sold at public auction. Address, COLUMBIA FARM DAIRY, 2900 Hollenbeck Ave., Los Angeles, Cal. Dairy located at the end of Euclid avenue.

SHOPPING BY MAIL.

PURCHASE THROUGH US—WE ARE a Mail Order House. We furnish anything desired from a spool of cotton to an automobile. Send for catalog. COLUMBIA COMMERCIAL COMPANY, 204 East 9th St., Los Angeles, Cal.

much more serious infestation next year. Care should also be taken to use only clean seed. Indeed, the sale of seed containing dodder should be a severely punishable offence.

Infested clover or lucerne should not be fed to stock, as seeds may be voided unaffected in the manure, and reinfect new ground. Above all, good cultivation in the widest sense should prevail, and all fields, hedges and ditches should be kept clean and free from weeds, especially leguminous ones. Dodder also grows on St. John's Wort and other weeds, but usually not on compositae.—Journal of Agriculture of Victoria.

SEEDING ALFALFA.

Hardly a mail comes to the Colorado Agricultural College writes P. K. Blinn that does not contain an inquiry in regard to the sowing of alfalfa, the varieties best adapted to particular localities, the quantity of seed required per acre, and the conditions and methods necessary for good results.

The Colorado Experiment Station has been testing the different varieties and endeavoring, by the systematic selection of the best individual plants, to develop a superior type of alfalfa for hay and seed production. The results of the work have been very promising, indeed; but at present there is no seed available for distribution, although efforts to produce seed sufficient for wider tests are being put forth. The varieties that have given the best results in nearly all the tests have been the northern grown types. Some of the Turkestan strains, the Grimm alfalfa, and the varieties that have been introduced under the name of Sand Lucerne, are the most hardy and vigorous types. The Arabian variety has not been hardy, even in southern Colorado and the same has been found to be true of all the seed from the hot countries. [It is proving most satisfactory in California and will probably be planted extensively this fall.—Ed.] Nearly all our native alfalfa, especially that from California and the southwestern states, has reached us by what might be called the southern route, i. e., it was brought over by the Spaniards into South America; then across into Chili, and thence north into the southern and southwestern part of the United States.

While it has been a great acquisition to our western agriculture, it has lacked hardiness to some extent, and this probably accounts for the extravagant recommendation for planting twenty to thirty pounds of seed per acre.

Usually it is the lack of proper conditions, rather than the lack of quantity of seed, that is responsible for a failure in getting a stand of alfalfa. A pound of alfalfa seed contains about 225,000 seeds, and ten pounds of seed per acre would give fifty or more seeds to a square foot of ground. If the seed is vigorous and hardy and the conditions favorable, ten pounds of seed should insure a stand of from three to five good stools per foot, which is sufficient.

A fatal error is often made by sowing the alfalfa seed too deep in the drills with grain three to four inches deep; alfalfa will seldom reach the surface under such conditions. The usual method is to broadcast the seed just ahead of the grain drill, either with an attachment on the drill or by hand; in this way some of the seed is covered about the right depth, by harrowing after the drill. But much of it is so near the surface that it will not survive; therefore, much seed is wasted. The ideal method would be to have a drill that would accurately regulate the amount of seed and sow uniformly by drills not much over three-fourths of an inch in depth. We are sadly in need of a drill especially designed for sowing alfalfa seed. If one has only a small area of two or three acres to sow, it might pay to take the pains to sow with a common garden drill, so as to insure a uniform depth of planting.

All the tests the writer has made with the drilling of alfalfa in rows have shown encouraging results in both hay yield and in the production of seed, as it allows better chances to cultivate and regulate and control moisture. It also economizes seed, for in drills eighteen to twenty inches apart, four to five pounds of seed per acre will give a good stand of alfalfa.

MACHINERY.

FOR SALE — COMPLETE PUMPING plant 6 H.P. gasoline engine and No. 3 centrifugal pump, also fittings. MACHINERY EXCHANGE, N.W. cor. Main and Bruno Sts., Los Angeles, Cal.

FOR SALE—50 H.P. GASOLINE ENgine as good as new. Also other machinery. Will sell to suit purchaser. Can be bought cheap. Address 117 Bruno St., Los Angeles, Cal.

FOR SALE—RENT OR EXCHANGE, boilers and engines, gas engines, pipe and oil well casing, pumps, all sizes and makes; get our prices before you buy. A. CANNADY & CO., 691 N. Main St., Los Angeles, Cal.

FOR SALE—MEHRING MILKING Machine with extra parts and covered pail, all in good order. WM. H. BIRD, Box 6, Compton, Cal.

FOR SALE—COMPLETE LINE CENtrifugal pumps horizontal and vertical. Some rare bargains in slightly used, also second hand fittings. BAILIE & BRANDT CO., Agents Union Gas Engine Co., 943 N. Main St., Los Angeles, Cal.

FOR SALE—BELT DRIVEN AIR COMpressor 10x10, practically new. Will sell at a snap. BAILIE & BRANDT CO., 943 N. Main St., Los Angeles, Cal.

FOR SALE—U. S. BABY CREAM SEParator, No. 9, very little used, $25.00. D. F. McLeod, Box 14, Arroyo Ave., Pomona, Cal.

WONDERBERRY PLANTS.

A LIMITED QUANTITY OF GOOD healthy Wonderberry plants at 25 cents per dozen postpaid. B. STUBBLEFIELD, 818 W. 43rd Place, Los Angeles, Cal.

Have the Time of Your Life

with my Portable Billiard and Pool Tables. Send for Catalog and let me show you good, practical Tables at the price of toys. Used anywhere. No special room required. **C. RIDDERHOF**
Merchants Trust Bldg., Los Angeles

NITRATE OF SODA.

Nitrate of Soda acts very beneficially and with great certainty on all strawgrowing plants. It is exceedingly valuable in developing and maintaining meadow grass and pasture lands.

The experience of the Rhode Island Experiment Station shows in a positive manner the special advantage in its use where the soil is sour.

The nitrogen of legume crops is too slow to be of very much use since it requires a year before it becomes available, and then not rapidly enough for the demands of rapid growth; thus the early markets would be lost. In California in particular, where the cereals are so largely used for hay, their growth in the cold part of the year imperatively demands nitrate of soda since the process of nitration is very much hindered by our winter temperature.

On nursery stock and on bearing trees the influence of nitrate of soda is extremely beneficial as it insures rapid, vigorous growth; and it is plain that the larger the tree the greater its capacity for fruit-bearing. The failure of fruit trees to set fruit is largely due to lack of plant food, and more particularly nitrate of soda.

It has been applied with much advantage to various kinds of berries, bush fruits, vineyards, orchards, and small fruits generally.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

Household Department

FROM DAY TO DAY.

If the world seems cold to you,
Kindle fires to warm it!
Let their comfort hide from view
Winters that deform it.
Hearts as frozen as your own
To that radiance gather;
You will soon forget to moan,
"Ah! the cheerless weather!"

If the world's a wilderness,
Go build houses in it!
Will it help your loneliness
On the winds to din it?
Raise a hut, however slight!
Weeds and brambles smother;
And to roof and meal invite
Some forlorner brother.

If the world's a vale of tears,
Smile till rainbows span it!
Breathe the love that life endears,
Clear from clouds to fan it.
Of your gladness lend a gleam
Unto souls that shiver;
Show them how dark sorrow's stream
Blends with hope's bright river!
—Lucy Larcom in the Independent, 1868.

A CHANCE ACQUAINTANCE.

HAWLEY walked the length of the car, but the only vacant seat was beside a young lady reading a magazine. He hesitated a moment, then, with the usual "Is this seat engaged?" to which he received a faint smile and a negative reply, he dropped into it. The young lady immediately resumed her reading and Hawley cast several side glances in her direction which finally convinced him that she was a charming young person.

Small of stature, with a wealth of chestnut-brown hair, large eyes of the same hue, a clear pink-and-white complexion and a charming little mouth.

He noticed the article she was so engrossed in was "A Chance Acquaintance." He had read the same story, and as the train rumbled along he settled down deeper into his seat and fell to dreaming of the similarity between the man in the story and himself, for there was, to be sure, up to a certain point.

Hawley got no further. A faint sigh, coming from somewhere near his right shoulder, interrupted him. The girl must have realized what she had done, for she glanced up quickly and their eyes met. Then they both smiled at the humor of the situation.

"Rather an interesting story," ventured Hawley, nodding at the magazine.

"Y-e-s," she murmured, the pink in her cheeks deepening.

There was a moment of silence. "I was just thinking," Hawley continued, "of the similarity between that man and myself—that is, up to a certain point."

"Yes."

This time the tone was more encouraging.

"Yes," he went on. "You see, I, too, am on my way to my old home, the first time I've been back since I went away 15 years ago. Quite a long time; don't suppose I will know any one there now, unless others, like myself, go back to see the old town, and I guess that's what Old Home week is for."

"But it was something besides Old Home week that brought the other man, the one in the story, back," murmured the girl, as she paused.

Hawley smiled, nodding.

"Yes, that's so," he replied, "and perhaps it's something else that brings me back."

"Oh," she murmured, and again the pink deepened.

"You see," he explained, "I was only 10 when I went away; went to live with an uncle in the city, and there was a little girl of seven and we were playmates. We often played we were married and often promised each other we would be some day; just a lot of childish nonsense to look back at now, and still I've often wondered what became of her. Married, probably, to some hard-working farmer, the mother of a family, and her childhood lover forgotten."

"Was she pretty?" asked the girl, glancing out of the window. Hawley laughed.

"Well, as I remember her, she had rather an abundance of freckles, hair inclined toward what we now call auburn, and—"

"As straight as a string," broke in the girl. "The usual type."

"Something like that," assented Hawley.

For a few moments neither spoke. The girl kept her eyes glued on the passing landscape and Hawley felt that the subject had been exhausted, and was at a loss for another. But just then the brakeman called out the name of the next station and the girl began gathering up her things.

"Oh, do you get off here?" Hawley asked.

"Yes. That is, change."

"Not to the Winson branch?"

"Yes."

"How fortunate! I am going that way, too; may I help you?"

She allowed him to take her suitcase and soon they were again seated together on the Winson branch train. And as there were but four stations on this road Hawley was curious to know where she was going. She was a charming young person and he—well, he would like to know who she was and where she lived. He was wondering if she would take offense if he asked, when she again took up the former subject, saying:

"But the man in the story returned and married his childhood sweetheart. Judging from your description of yours you probably would not care to. That's what you meant by 'up to a certain point,' wasn't it?"

"Why, no, not exactly," he replied, then added: "But probably she has changed since then—I doubt if I would even know her now."

He glanced at the girl. They had passed one station and were nearing the second, and she made no motion to leave. He glanced at her ticket as she passed it to the conductor, but it was face side down.

Again she took up the subject, discussing it until they had passed the third station.

"You must be going to Winson, too?" Hawley ventured at a break in the conversation.

"Why, yes," she returned. "Old Home week, you know."

At that moment a heavy hand fell on Hawley's shoulder, and a gruff voice cried: "Well, Jed Hawley as I'm

THE SAVINGS AND LOAN SOCIETY.

This Trade-Mark is on Every Roll of

REX FLINTKOTE ROOFING

There are just two ways to tell REX Roofing—one is by the service it gives, and the other is by the Boy trade-mark on every roll. Imitations are made that have an outward resemblance to REX Flintkote, but you can't tell anything about the service until after the roofing is laid; so it will pay you to fix the Boy trade-mark in your mind before you start out to buy. It means advance assurance of satisfaction.

Write for Book and Samples—Free

The book will tell you all about REX Flintkote ROOFING and give photographs of buildings on which it is used, with letters of recommendation from users. The samples will show you what REX Flintkote ROOFING really is and enable you to test its properties.

alive, and—" here the man paused, looking curiously at the girl, who was intensely interested in the passing scenery, her cheeks now a flaming crimson, which extended back to her shell-like ears—"did you and Elsie hitch up after all?" he added in a hoarse whisper.

The true situation burst suddenly upon Hawley, and for a moment left him speechless. He gazed at the old man, then at the girl, who was trembling with suppressed merriment.

"—I—well—you see—not—not—yet ——" then he paused in confusion, and the girl's ringing laugh, as she turned to him, only added to it.

"Jed Hawley," she cried, "you ought to be ashamed! I knew you the minute you spoke. Freckles—red hair! Indeed! I'll never forgive you—never!"

But her sparkling eyes belied her words, and when Old Home week was over——

But why tell the rest?—Exchange.

About the House

THE fruit season is almost here and these general rules for canning, published by a domestic science instructor of an eastern agricultural college, may be of value to the Cultivator readers:

The addition of sufficient sugar to agreeably sweeten fruits has no effect upon the keeping qualities of the food, but is advantageous inasmuch as the sugar thus used penetrates into the substance of the fruit and increases its palatibility.

One-half cup of sugar to each quart of fruit is a good general rule, but one which will require some modification where excessively sour fruit is used. The time at which the sugar is added, whether when fruit is put on to cook or later, will depend upon the texture of the fruit itself. Where the fruit is tender and inclined to break during cooking the sugar should be added before the material is heated. The sugar will slightly toughen the fruit and it will retain its shape better. If the fruit is tough it should first be softened by boiling and the sugar added after the fruit has become tender, for, as above stated, the sugar toughens fruit when added before cooking.

Not more than four quarts of fruit should be boiled at one time in a kettle, because when there is a large amount portions will be mashed and overcooked and other portions insufficiently cooked, and the quality of the canned article is injured.

No tin or iron utensils should be used in cooking fruit or vegetables for canning.

The filled jars should not be placed in a draft of air while hot, as there is danger of their breaking.

It is desirable, though not absolutely necessary, to store canned fruit in a cool, dark place.

The same general care is required in the preparation of fruit preserves as in canning.

Three-fourths of one pounds of sugar is added to each pound of pared fruit, the fruit and sugar being long and carefully cooked together.

Preserved fruit will not ferment because the sugar added makes it too solid for yeast organisms to grow in it, though mold will grow upon it, if it is not protected from these.

Jams, butters and marmalades are modifications of preserved fruits in which the fibre of the fruit has been broken and mashed by forcing through a colander or sieve.

Sweet pickles are fruits preserved in a syrup of vinegar and sugar to which has been added cinnamon, cloves and other spices.

Jellies are prepared from fruit juices and sugar. The fruit should be fresh and slightly underripe. It should have only sufficient water added to keep it from burning. When tender, the fruit should be strained through a bag of double cheesecloth or a single thickness of flour-sacking or cheap flannel. The fruit juice, after draining, should be measured. Four cups of the juice should be placed in a large-bottomed kettle and boiled rapidly until reduced to three cups. Three cups of sugar should be added and the mixture boiled up once and skimmed, after which it is ready for the jelly glasses. One spoonful of melted paraffin should be poured over each glassful of jelly before the cover is put on. The rapid boiling and preparation of but a small amount at each cooking, are the two things that will insure success.

Vegetables may be canned successfully, but to do this it is necessary to place the cleaned, prepared vegetables in clean jars, place the rubber and lid in position without screwing down, arrange the jars on a support in a kettle or wash-boiler, surround the jars with cold water and bring to a boil. After they have boiled fifteen minutes screw lids down tight and continue to boil from two to four hours. The long boiling does not injure.—Elbepe.

A HOME MAKER'S NOTE BOOK.

If I were blessed with the gift of oratory, and had sufficient magnetism to hold an audience, I'd write a lecture entitled "Don't Fret," and deliver it all over the civilized world. I believe such a lecture might do a great deal of good. I know such admonition is greatly needed.

There is no real use in this world for fretful people, unless they are sent to stimulate patience in those who cannot avoid them. Things were never made any better or more easily borne because of fretfulness, and the atmosphere around a fretful person is so blue that it cannot be otherwise than extremely unhealthy. Fretful people are always regarded by others with a sort of good natured contempt. If they are very fretful, people keep out of their way as much as possible because it is pleasanter to do so. For the same reason a fretful person's mandates are sometimes obeyed. "Any thing, any thing so as to have a little peace in the family," is the feeling that prompts the obedience, rather than a conviction of the wisdom of such a proceeding.

A fretful person could never become a successful commander, preacher or teacher. People have too little respect for them for that. They are certainly not desirable as members of a family either as father, mother, sister, brother, aunt, uncle or cousin.

How nice it would be if it were possible to segregate the fretful! Did you ever notice how easily annoyed fretful people are by the fretfulness of others? Perhaps, if forced to bear, as they force others to bear, they might become cured. If fretfulness were a disease and there were no cure for it, the poor victim would be then pitied and endured, but as it is simply a state of peevishness and ill humor, of allowing one's self to grumble about everything and anything, it does seem

hard that every one else must be made so uncomfortable by it.

It seems strange, when fretfulness is always so easily discovered in others that it is so hard for one to see it in one's self. That one does not realize how inveterate the habit has become with him, must be the only reason why it is so prevalent, for I cannot believe that so large a portion of humanity would willingly make themselves so obnoxious to every one who is forced to associate with them.

For my part, I believe I would prefer that my friends should tell me when they saw me becoming unnecessarily fretful, than that they should feel like avoiding me. I know the information would not be pleasant to hear, but it seems to me I should thank them, and try to control myself.—St. Jo., Fruit Grower.

WHEN SWEEPING.

To prevent making a great dust when sweeping use moist sawdust on bare floors. When the room is carpeted moisten a newspaper and tear it in small scraps and scatter on the carpet when you begin sweeping.

As you sweep brush the papers along in front of you. They will catch most of the dust and hold it fast just as sawdust does on the bare floors.

In dusting a room do not use a duster, for this does not remove the dust from the room; it merely sends it into the air and it will then settle on some other part of the room. Use soft dry cloths that will not leave any lint and shake them frequently out of the window, or use slightly moistened cloths and rinse them out in water when you have finished.

EXTENDING ZONE.

"Teacher says," exclaimed the precocious child, "that we live in the temperate zone."

"Yes," answered Colonel Stilwell, "and if these Prohibitionists keep going it'll be worse than that."—Washington Star.

Hague Domestic Oil Burner

Showing the Method of Attaching to Cook Stove. A device for using low grade distillate. Saves 40 per cent of cost of coal or city gas—let us prove it. Write for circular.

Hague Domestic Oil Burner Co.
214 Winston St., Los Angeles, Cal.

PUZZLED.

You ask me whether I'm High Church,
You ask me whether I'm Low;
I wish you'd tell the difference,
For I'm sure that I don't know.
I'm just a plain, old body,
And my brain works pretty slow;
So I don't know whether I'm High Church,
And I don't know whether I'm Low.

I'm trying to be a Christian,
In the plain, old-fashioned way
Laid down in my mother's Bible,
And I read it every day;
Our blessed Lord's life in the Gospels,
Or a comforting Psalm of old,
Or a bit from the Revelation
Of the city whose streets are gold.

Then I pray; why, I'm generally praying
Though I don't always kneel or speak out.
But I ask the dear Lord, and keep asking
Till I fear He is all tired out;
A piece of the Litany sometimes,
The Collect, perhaps, for the day,
Or a scrap of a prayer that my mother
So long ago learned me to say.

But now my poor memory's failing,
And often and often I find
That never a prayer from the Prayer-Book
Will seem to come into my mind.
But I know what I want, and I ask it,
And I make up the words as I go.
Do you think now that shows I ain't High Church?
Do you think that it means I am Low?

My blessed old husband has left me;
'Tis years since God took him away;
I know he is safe, well, and happy,
And yet, when I kneel down to pray,
Perhaps it is wrong, but I never
Leave the old man's name out of my prayer,
But I ask the dear Lord to do for him
What I would do if I was there.

Of course He can do it much better;
But He knows, and He surely won't mind
The worry about her old husband
Of the old woman left here behind.
So I pray, and I pray, for the old man,
And I'm sure that I shall till I die;
So maybe that proves I ain't Low Church,
And maybe it shows I am High.

My old father was never a Churchman,
But a Scotch Presbyterian saint.
Still, his white head is shining in Heaven,
I don't care who says that it ain't.
To one of our blessed Lord's mansions
That old man was certain to go.
And now do you think I am High Church?
Are you sure that I ain't pretty Low?

I tell you, it's all just a muddle,
Too much for a body like me;
I'll wait till I join my old husband,
And then we shall see what we'll see.
Don't ask me again, if you please, sir,
For really it worries me so,
And I don't know whether I'm High Church,
And I don't know whether I'm Low.
—Annie Trumbull Slosson.

OPPORTUNITY.

Master of human destinies am I!
Fame, love and fortune on my footsteps wait.
Cities and fields I walk. I penetrate
Deserts and fields remote, and passing by
Hovel and mart and palace soon or late,
I knock unbidden once at every gate.
If sleeping, wake; if feasting, rise before
I turn away. It is the hour of fate.
And they who follow me reach every state
Mortals desire and conquer every foe
Save death, but those who doubt or hesitate,
Condemned to failure, penury and woe,
Seek me in vain, uselessly implore—
I answer not, and I return no more.
—John J. Ingalls.

Every Blade Tested

Like all the famous Keen Kutter Tools and Cutlery—not a single Keen Kutter Safety Razor is sent out until it is worthy to uphold the well-earned reputation of the name. Every blade is tempered, ground, honed and tested until it will cut a hair at any part of its edge. The

KEEN KUTTER
Safety Razor

is the only one adjusted to give the sliding stroke that cuts the beard clean and smooth without pulling.

The angle of the blade is exactly right to cut close without scraping.

The quickest, closest, smoothest, most comfortable shave—any time—any where—is assured with the Keen Kutter. The Keen Kutter Safety Razor is guaranteed.

Silver Plated in Genuine Black Leather Case, $3.50.
Gold Plated in Genuine English Pig Skin Case, $5.00.

Save one-third—buy on the Cornish plan.

Angle Lamp
The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT,** soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Hay.

Scott & Magner say: Arrivals during the past six days have amounted to 1,908 tons, being still a dropping off in receipts from the hay which came in during the previous week. Notwithstanding the light arrivals, the market has been droping, and the feeling is considerably weaker by reason of the dropping off in the demand. All of the purchasers are looking for the arrival of new hay, and as a result, are only buying in small quantities, anticipating a drop in the market.

A little new hay has been coming in during the week, but not in any quantity sufficient to affect the market. It will probably be a couple of weeks before any appreciable amount of new hay is in the market here. Reports from the country indicate that warehouses are practically cleaned up, and there will be very little carryover stock this year.

Reports of the new crop are encouraging, and indicate a plentiful supply in every direction. This will be greatly increased by a little rain within the next two or three weeks, which some sections badly need. General crop conditions are most encouraging.

Better grades of hay sell readily; poor alfalfa and stock hay have practically no demand, and must be disposed of at great sacrifice in order to effect a sale. New alfalfa has been coming in here sparingly, with practically no demand. The prospect of new crop alfalfa of good quality is holding down the sale and the price of what little is left of the old crop.

Citrus Market

LOS ANGELES, May 5, 1909.

The supply of fruit has continued to fill the Eastern market until a decidedly easy condition prevails. This has not reached a situation where any particular concern is felt for as yet the good sizes have been commanding a price which will bring practically

Cream Separators, all sizes, all prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles,

$1.50 f.o.b. California. Off sizes which are in large quantities have for sometime sold exceptionally low. The season seems to have favored the growing of large fruit and as yet there has been no particular complaint of puffs. Slowing up in shipments which has been hoped for has not materialized and until that occurs, especially with vast quantities of berries and small fruits now coming in the Eastern market, there can be no hope of increase in prices.

Lemons are also somewhat in the dumps, owing to cold weather. All sales are affected some by the weather and as the season warms a keener demand will be developed.

Shipments.

The total shipments of citrus fruits since November 1, are 22,264 cars of which 19,467 were oranges and 2,729 lemons. To this date last season the total was 19,923 cars of which 17,684 were oranges and 2,239 lemons.

NEW YORK, May 3.—Fifty-nine cars oranges, one car grapefruit and one car lemons sold. The market held very steady, considering the size of the offering, especially on good, sound stock. The sale dragged very badly, however, and extended late into the afternoon.

Now is the time of year that the ever present question prevading the family council is, "Where shall we go, or what shall we do this summer?" The planning and scheming period is now upon us when our thoughts turn from the sordid pursuits of city life; for man hath need of rest and he longs for the simple joys the country yields. We all wish to set aside for awhile the cares and worries of business and visit the Blessed Isles of rest and recreation.

To aid you in selecting a place for your outing or to locate your family for the summer so as to make possible week end trips, the Northwestern Pacific Railroad, the Picturesque Route of California, has issued a book called "Vacation." This book describes the garden spots and playgrounds of California in the counties of Marin, Sonoma, Mendocina, Lake and Humboldt. You can find in this book some place to suit your fancy and your purse, whether it is to fish, hunt, swim, rusticate on a farm, or visit the numerous mineral springs or resorts.

The issue of "Vacation 1909" is now ready for distribution and can be obtained from the Northwestern Pacific Railroad at the Ferry Ticket Office, the Up-town Office 874 Market St. and Room 986 (General Office) Flood Building, San Francisco, Cal.

GUARANTEED TOOLS.

It may sound rather odd to the average man who uses tools to tell him, that it is just as easy to select a perfect tool as one of inferior grade. But such is the case if you ask for "Keen Kutter" tools, which have for nearly forty years been famous everywhere for their quality and durability. To purchase "Keen Kutter" goods is to be absolutely certain that you are getting the best that money can buy. Besides you are getting tools that are guaranteed—every one of them—and if they are not all that they are represented to be you can have your money back or a new tool.

Such a guarantee as the makers, the Simmons Hardware Co., of St. Louis, put behind every "Keen Kutter" tool, has created a steadily increasing demand until at the present time this Company turns out an enormous amount of tools every year for the farm, for the shop, for the home. In fact, the Simmons Hardware Co. gives every tool manufactured the severest kind of test so that when it reaches the purchaser it is ready for service, whether it be a gimlet, a hammer, a razor or a lawn mower.

Every edge tool with the "Keen Kutter" stamps has been finally sharpened and you do not have to work up the edge yourself. You will note that ordinary tools you buy have to be sharpened after they are bought. Many factories will not risk the final test, because under this strain hundreds of tools would be put out of business, flaws appearing in the most unexpected places or an edge failing to hold because of improperly tempered metal.

That guarantee tells a great, big story, does'nt it?

If your dealer does not have the tools you want, write to the Simmons Hardware Company (Inc.), either St. Louis or New York. They'll put you on the right track.

SOLVING IRRIGATION PROBLEMS.

Irrigation problems have been simplified in recent years by the introduction of the gasoline engine. Lands formerly thought to be beyond the reach of water have been brought under cultivation. Long and costly ditches have been rendered unnecessar. Flumes which are always costly to maintain have been abolished and large tracts of bench and bluff lands lying high above a running stream or lake have been reclaimed.

An institution which has done much to show the advantage of irrigation by pumping water is The International Harvester Company of America. This company sells a line of powerful, dependable gasoline engines and has insisted for years that they go far towards solving vexatious irrigation problems.

The International Harvester Company gasoline engines are built in several styles and in a large number of sizes so that among them something will be found to meet the wants of all classes of land owners. One feature about these engines which comes as a welcome surprise to most farmers who inquire into their value for irrigation purposes, is that they require so little attention that but little of the irrigator's time is required in looking after them.

International local agents throughout irrigated districts will supply catalogus and full particulars to anyone inquiring for them. If you have a piece of land which for any reason you cannot irrigate from the ditch, it will be worth while to call on one of these agents and investigate the I. H. C. gasoline engines.

A UNIQUE PUBLICATION.

A national magazine for motorists which will not accept a single line of advertising and which is mailed free to one hundred thousand people each month, is the unique publication known as the Rambler Magazine published by Thomas B. Jeffery & Company, makers of the Rambler car in the interest of fourteen thousand Rambler owners.

We quote a letter which appears in this issue which is interesting to farmers, etc.

I find the auto a great convenience and a great time saver. Have had my header break twice in one day and each time I left the men and teams standing as they were, jumped into my auto, went to town (4 miles) got the necessary repairs, and in less than one hour had the work moving on with renewed energy owing to the short rest. I paid my help for full time and believe I got value received.

A motor car is an indispensable piece of machinery on any up-to-date farm. Automobile owners as a class, are the most enthusiastic good roads people in the world. I will venture to assert that any man who has owned an auto any length of time has done more toward improving the public roads than anyone else. J. A. Green, Waynoka, Okla.

A free copy of this latest issue is sent to any one who makes request of the publisher. Thos. B. Jeffery & Co., Kenosha, Wis.

Office and salesroom, 629 S. Olive St.

WHAT IS AXLE GREASE WORTH?

Who stops to think that **axle grease** cuts any figure in business economy, or that there is a difference **between** grease and grease—some being better, others worse? Yet it's a fact that the **adhesive quality** of an axle lubricant or its ability to **wear**, will raise or lower the expense account of a great city's commerce by a very considerable sum every year.

If you doubt it, stand for an hour on any busy corner and count the truck loads of merchandise moving toward railway terminal or steamship pier. Estimate, if you can, what it would mean to each shipper in time, and team and truck-wear, if there was a little fraction less of friction required to move each load.

Any grease is better than **no** grease, but no grease is better than—or as good as—"Mica." Probably if you found opportunity to interview a few busy dray-drivers, they would tell you that they know "Mica" is all right because they use it—and if you asked further **why** it's all right, they would say—"oh! it **stays on,** it wears better than any other grease and it makes a truck run easy."

There you have it! It **stays on,** and it makes wheels turn **easy.** No wonder more Mica Axle Grease is sold than of all other kinds combined.

Tuttle's Elixir Co., Boston, Mass. Gentlemen:—I want to express our appreciation of your valuable horse remedies which we are receiving through Prof. C. F. Tuttle at your branch offices, 311 East 63rd St., Chicago, Ill. We have used your remedies freely for the last six months on many of our horses with the most satisfying results. When a horse gets hurt, it don't make any difference what the injury is—we don't have to lay him up a single day when Tuttle's Elixir is first applied. I am pleased to recommend Tuttle's Elixir to our friends and all who own and care for horses Very truly yours, S. G. Kinney, Prop., South End Express Co., 54 Harrison St., Chicago.

Hawaiian Islands Grow Superior Pines

A Field of Luscious Pineapples as They Grow Them in the Middle of the Pacific

THE FINEST pineapples now produced in the world are said to be those which are shipped into this country from the Hawaiian Islands. A few years ago they began coming in and were remarkable for their size and quality and were considered more as a curiosity than a fruit which would be a commercial factor, but for at least two or three years the production has increased so greatly that they have become common in many of our larger markets. In fact, so much so that at times they have been put upon bargain counters.

This has caused the Hawaiian people to take up a campaign of advertising over this country which has been an educational factor in showing the American people that American territory is producing great quantities of this luscious fruit and that it may do so at a reasonable price. The Islands are now putting up about 9,000,000 cans of pineapples annually, and the advertising campaign is largely to create a market for this immense output. The centre of the Hawaiian pineapple culture is in the island of Oahu on which the city of Honolulu is situated. The industry is largely in the hands of Americans who have settled there since the American possession. These growers have organized a Hawaiian Pineapple Growers' Association, a purely co-operative marketing organization.

The Dish Pans Tell The Story

TRADE Sharples MARK 29 Yrs

The easiest way to prove a thing is to show it.

For years, we have advised farmers and their wives to let "bucket bowl" cream separators of all sorts alone — because they wash hard, rust easily, are easily damaged and wear out in consequence.

How do you like this solid dish pan full of disks? There is absolutely nothing in that pan but disks—just disks from the bottom up—and all from a "bucket bowl" machine a disgusted farmer and his over-worked wife discarded for a Sharples Dairy Tubular.

They got very tired of washing and drying it twice a day.

Will you wash one piece or a pan full? If you prefer one piece, then get a Sharples Dairy Tubular Cream Separator instead of a "bucket bowl" machine. Sharples Dairy Tubular bowls contain only one little piece, instantly removable and just like the single piece in the dish pan. All other separators are the "bucket bowl" kind—full of parts and works. The full dish pan contains the many disks used in one of the "bucket bowl" machines that are being discarded by the car load for Sharples Dairy Tubulars.

What's In The Other Pan?

That little piece in the other pan is the triple tinned, pressed steel, wear forever dividing wall used in the Sharples Dairy Tubular Cream Separator bowl. It is about like a napkin ring in size and shape, is just as easily washed, is instantly removable and is **absolutely all there is inside Sharples Dairy Tubular Cream Separator bowls.**

You'll never forget this picture. Every time you think of cream separators you'll think of the difference between the Sharples Tubular and the "bucket bowl" kind — a difference in work, wear, efficiency and profits just as great as the difference in the contents of these two pans.

It is not surprising that Tubular sales exceed those of most, if not all, other separators combined. "Bucket bowl" sales are so reduced, by Tubular popularity, that the leading maker of disk machines (the self styled "original" disk maker) has found it necessary to commence suit against a catalog house that has been making and selling a cheap separator with disks like his for a number of years. Why? Because he has lost his grip—taken a back seat—is so out of date that he's scrapping for trade with the catalog house concern.

The Tubular is made in the world's greatest cream separator factory. Branch factories in Canada and Germany. It is the world's greatest cream separator. It will give you greatest satisfaction—greatest profit — greatest wear. Get catalog No. 260

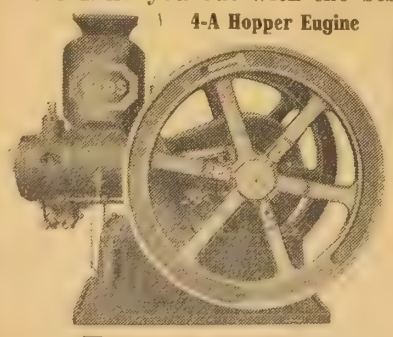
For Your Pocketbook's Sake---Read This

I am so confident that the Olds Engine is the most economical and most durable engine you can buy that I will make this proposition to every buyer of an Olds Engine.

I agree to replace, free of charge, any part of an Olds Engine that breaks or becomes worn, from any cause whatsoever, within one year from date of shipment, provided the replacement is one you think should be borne by the manufacturer. You are to be the only judge. There is to be no argument, no delay in returning old parts and getting new ones; you decide and I abide by your decision.

J. B. SEAGER, Gen'l Mgr.

Do you think this proposition could be made on any engine but a practically perfect one? You can easily see that to stand this supreme test of durability and perfect workmanship it must be built right, of the very best material, of the simplest construction. This is the kind of an engine you want. You take no chances in buying an Olds. All of my representatives can furnish these repairs without any delay. They do not have to consult me. Write to my nearest agent. He can fix you out with the best engine you can buy, no matter what others cost.



4-A Hopper Engine

OLDS ENGINES

Give you the power you need at the price you can afford to pay for it.

Some of the Features of the Olds Engine

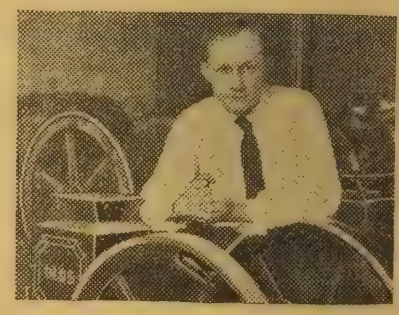
Olds Patent Seager Mixer—The only one that makes a perfect mixture of gas and air, giving the greatest power. No pump to leak or get out of order—No moving parts.

Removable Valve Mechanism. Removable Water Jacket. Jump Spark Ignition. Piston and cylinder ground to a perfect fit, giving better compression and more power.

Simplicity, three separate inspections, durability, economy and certainty of operation.

Our catalogue explains these points in detail.

Olds Engines are of the highest efficiency at the very lowest price because we can produce them without wasting a penny's worth of labor.



J. B. Seager, Gen'l Manager

I guarantee every Olds Engine that leaves the factory to be in perfect running order. I do not spend much time in the office. I am out in the shop with my coat off watching every detail. By keeping right out among the workmen, seeing that all the little things are actually done, I know the engine you get is all right, and that the high Olds standard is maintained. I also know the engine is "Best by every test," because I look after the testing and inspecting myself. They are the best you can buy, whether you pay less or more than the Olds price.

Write me about your own particular case. Let me advise with you. What I can tell you will fit your case exactly. Then you can decide what engine to buy. J. B. SEAGER, Gen. Mgr.

Do Not Think of Buying an Engine Without Investigating an Olds

Write Today for Our Handsome Catalogue

It contains many fine pictures of the very latest models of Olds Engines with a detailed description that makes the engine question as plain to you as an open book. It contains letters from farmers who have used the Olds Engines, and they give their practical every day experience with it.

Olds Engines are made in all sizes to suit every kind of work on the farm. We have exactly the kind of engine you want. Tell me what you want to do with it, and I will tell you just exactly the kind of engine you want to buy to do the work. It will be an expert opinion that costs you nothing.

Our hopper jacket engine on skids or wheels, 3 to 12 H. P., is ready to run when you get it. Fill it with gasoline, throw on the switch, turn the wheel, that's all. No piping to connect, nothing to set up, always ready, can be moved anywhere.

We also make regular engines 8 to 50 H. P. for heavier work.

Every Olds Engine is fitted with the Seager mixer which is recognized as being the most effective mixer that has ever been invented. No pump to leak, no moving parts to get out of order. They also have a removable water jacket so if through carelessness the water should freeze but very little damage is done.

It is to your decided advantage to send for our Catalogue.

Do it now before you forget it. A postal card will do, but better still write me a letter, telling me what you want the engine to do, and you will get a personal letter from me that will give you the facts you want.

Write me or my nearest representative.

Work of the Dry Farming Congress

A Summary of the Last Dry Farming Congress, Which Has Caused Dry Farmers to Take Notice

THIS Congress has opened the eyes of the world to the fact that men do not know as much as they thought they did about farming. It awakened them to the necessity of studying fundamental principles and applying these principles to practical husbandry. It revealed methods developed at numerous experiment stations by which land hitherto considered worthless can be made productive. It was demonstrated that these methods have been successful in nearly every instance where tried. Deep plowing and intense cultivation have been proven among the most important factors in successful agriculture, whether on so-called dry farms, or on irrigated lands.

The assertion, made in the past, that a certain amount of moisture—some said twenty inches—was absolutely necessary for the raising of a crop, has been entirely disproved. We are beginning to realize that we do not know how much moisture is really necessary to raise a crop under arid, or semi-arid conditions. Farmers gave the records of their work and produced exhibits of grasses, grains and roots grown upon land which received no moisture other than natural precipitation, which in only a few cases was up to the minimum formerly claimed to be necessary.

Prof. Linfield, of Montana, said that, notwithstanding the assertions made by scientists in the past that it takes 500 pounds of water to produce one pound of dry matter, in Montana crops of grain had been raised on ground which did not receive as much moisture as many people had been taught to believe was necessary. One of the most important results of the Congress was that it demonstrated that, while it may take a certain amount of water in some sections to dissolve the chemicals in the soil, making them available for plants to utilize, it is true that in the arid and semi-arid regions the fertility of the soil is extremely high and much less water is required to make plant food available in high altitudes. From reputable sources it was shown that big paying crops have been gathered under conditions where the majority of the people never believed such a thing possible.

These facts prove that farming in its broadest sense is decidedly in its infancy and that dry farming methods are among the most important factors in its development.

In high altitudes moisture can be conserved and held subject to the demand of growing crops by a proper system of plowing and cultivation. Big paying crops have been raised by farmers who received the minimum moisture as advocated by some experts. In cases where the rainfall for the district was the minimum one year and normal the following year, by raising one crop in the two years, the farmer has harvested a profitable crop. The many examples of this result brought out during the Congress demonstrated that a very small amount of moisture precipitated at a propitious time, helps vegetation much more than farmers realize.

The Congress has made the farmers of all the world ask, "What does it mean?" It has brought inquiries from all over the earth which show the intense interest taken in its work and indicate that a great many intelligent farmers will study their own conditions and apply principles advocated by successful dry farmers so as to get better crops and insure themselves against drouth. The Congress has interested gentlemen connected with the bureaus of the Department of Agriculture at Washington and there is no doubt that these gentlemen are now in heartier accord with the welfare and improvement of the dry farming interests than ever before. They showed this by their presence at the Congress and several of them publicly stated that they realized that the Dry Farming Congress represents a movement which is one of the most important in its economic and educational significance that has ever existed.

The Congress has aroused the interest of all bright and intelligent men who seek the welfare and success of the agricultural communities in which they are located. The railroads, always interested to a certain extent in the agricultural development along their individual lines, were represented at this Congress as at no previous assemblage of the kind. The number of representative railroad men attending the Congress showed that they were heart and soul in accord with the expansion of this movement along educational lines. These men realize that the prosperity of any community, city or town, depends to a large extent upon the agriculturist.

Mr. Frank Walters, of the Chicago & Northwestern railroad, furnished an example of the intense interest aroused by this educational movement. In behalf of his road he offered to place at my disposal a train whereby I could take a carload of exhibits through the country, showing what could be raised by dry farming and could reach the people along that line with a course of lectures. Vice-President and General Manager A. L. Mohler, of the Union Pacific, proved his interest in the work by visiting Cheyenne the opening day of the Congress. This brings to mind a fact not generally known, that while Mr. Mohler was general manager of the O. R. & N. at Portland, he was the prime mover in the establishment of demonstration and experiment farms at various places in Oregon under the auspices of careful and conservative experts in so-called dry farming. At one of these farms which he was the means of getting placed in Oregon, there are over 100 varieties of wheat and a great diversity of grasses being tested to find types best adapted for the use of farmers in Eastern Oregon and Eastern Washington. Mr. Mohler's interest in the welfare of agriculturists along his line remains unabated and he has a way of getting his company always to respond with funds to help along the good cause. G. W. Holdredge, of the Burlington, is another railroad man who gave evidence of his interest in the Congress. Busy as he always is, he dropped his work and started for the Congress, but, unfortunately, was prevented from attending its sessions by the storm. Largely through Mr. Holdredge's influence the Burlington company has given a great deal of help to dry farmers during the last few years.

One of the results of the Congress that will bring increased benefit to the western states throughout the coming year has been the fact that it has opened the eyes of the people in congested farming communities and in the densely populated cities of the East and the eyes of renters on farms and in cities to the fact that there are thousands upon thousands of acres of magnificent fertile land in many of the western states open to homestead. Or, they can buy deeded land at reasonable prices. They have been taught that experiment stations have been established in different states and have been informed that the Dry Farming Congress is working to secure the establishment of many more experiment stations. At these stations there are experts at the service of the settlers—experts both willing and able to show the best manner by which the maximum returns can be wrested from these fertile lands.

The stockman and the farmer have been brought closer together in bonds of mutual friendship and benefit instead of in the clash of enmity by this Congress. Conditions over a very large area of so-called arid and semi-arid land are such that nutritious fodders and crops are raised, or could be raised, for the stockman's herds and flocks. The stockman has begun to realize that it is necessary to supplement his winter range with feed. The dry farmer has shown him how to do this. This means mutual benefit, because the dry farmer can supply the feed for the stockman and the latter's animals. Instead of starving them to death, as in the past, the animals will be humanely treated and vast losses prevented.

Most of the banks, heretofore, have refused to lend money on what is called a "range proposition." These conservative and intelligent bankers realized that the risk was too great under existing range conditions to lend money to stockmen not prepared with feed to take care of their stock when necessity occurred. With a steady and reliable source of feed supply, the stockman will be placed upon a better footing in the eyes of the financier. For this the stockman can thank the dry farmer. The benefits from dry farming are not confined to those who raise cattle and horses, but the sheepmen also realize they get more wool and better lambs when their flocks are taken care of and fed when necessary. The same evolution that took place years ago in the great states of Oregon and Washington, where it was said that those magnificent empires were fit only for range purposes, is now taking place in Wyoming, Montana, Colorado and other states. It has been shown that under normal and abnormal conditions, by a proper system of intelligent work, grains, grasses and other forage crops can be raised in the greater part of these states. Where it was supposed only a few years ago that it was impossible to utilize these lands for anything except pasture, it has been forcibly brought before the people by the records of their experiments that those farmers who applied common sense methods and followed the instructions of the experts who have developed the various systems of dry land agriculture, have never failed.

At this Congress there was an exposition of dry farm products. In the exposition hall were also, by special permission, some examples of irrigated products. In this case, as in a number of instances in recent years where crops raised by dry farming and those grown under ditch have been brought into competition, the cereals and general exhibits raised by dry farming methods, to the astonishment of the world, have beaten the irrigated products, not only in quantity, but in quality.

This Congress by its demonstration of the possibilities for crop production in the arid and semi-arid regions has given encouragement to an immense number of agriculturists; has given them new life and new interest in their work by proving to them that, even if some fail, it is more than likely these failures are due to lack of thorough work and not to the soil or climate.

POTASH

in the ground is like cash in the bank —a reserve you can draw on with *immediate* results, for *Potash* is a fertilizer that is immediately available.

CITRUS FRUITS

are especially responsive to its influence, and no crop pays a better return on a Potash investment. Potash in the form of Sulfate. produces thin skin and fine flavor that means highest current prices.

POTASH IS PROFIT

Numerous tests have shown that a high percentage of *Potash* gives best results. See that your commercial fertilizer contains from 10 to 15 per cent. of Potash in the form of Sulfate.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT,** soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

PROBLEM OF MARKETING THE CITRUS FRUIT CROP.

THE marketing of oranges really begins before the trees are set out, before the fruit is grown. We can't get money for poor fruit, no matter how it is marketed. We must have the right locality, one that is free from frost, soil that is capable of producing fruit of good texture, and plenty of water. When the trees reach the bearing stages, then the questions of cultivation, fertilization and fumigation come up for consideration. Good fruit is at the foundation of successful marketing.

"The second step in the matter of marketing is getting the fruit from the trees and into the car. This is the most important part of the process. The appearance of a carload of fruit has much to do with its success in the private sale market. A well-loaded car is half sold before the prospective purchaser has seen the fruit. The same is true at auctions. On the other hand the fruit may be ever so good, but an unsightly appearing car will leave the shipper with a problem on his hands.

"The growers of Southern California now ship about 80 per cent of the fruit that goes out. The exchange handles about 60 per cent of this amount, and the private exchanges and grower-shippers 20 per cent. The success of the orange industry the past few years has been due to the amount of fruit handled by the growers themselves.

"If the 250 packing houses of Southern California were acting independently, we would be experiencing the same trouble that Florida is having. We would have some bare markets, regardless of the amount of fruit going forward. It is the policy of the exchange to hold things on a level basis, and conditions are better now with 60 per cent of the fruit handled through the organization than it was when there was only 40 per cent.

"A great advantage is gained in the matter of securing supplies, as has been illustrated in the long-term contracts which have protected the exchange from the manipulations in box deals. Tariff and traffic matters also have the careful attention of the organization.

"In the matter of advertising, we have come to the conclusion that we can make enough noise through the newspapers to sell 50 per cent more fruit. We commenced in Iowa a few years ago and increased the sales about 33 per cent. We have extended the advertising campaign somewhat, and the second year's experiment in Iowa looks better than the first. By covering the whole country at a cost of $200,000, we believe we can make the people eat 40 to 50 per cent more oranges. If so, then the question of over-production will quite or nearly disappear."—B. A. Woodford, manager of California Fruit Growers Exchange, before Y. M. C. A. Lecture Course at Riverside.

RED SPIDER.

From a report made by the Sutter County Horticultural Commission on Red Spider, we quote:

The red spider on almonds and prunes is usually controlled by the thorough application of dry sulphur on the foliage.

Almond trees should be treated as soon as the leaves appear in March. A second application is advised from the 1st to the 10th of April. A third application should be made from the 1st to the 10th of May.

Prune growers should watch their trees for the appearance of red spider and apply the sulphur as soon as the pest is seen. During past seasons the appearance of red spider has been noted from the 1st to the 10th of July.

When the thorough application of dry sulphur to the foliage will not control the red spider on almond trees (the cases are rare) use the

Sulphur Spray.

Sulphid of potash stock solution—granulated or powdered concentrated lye, 15 pounds; sublimed sulphur, 18 pounds; water to make 20 gallons.

Stir the sulphur and lye together in a vessel which will allow plenty of room for boiling. When well mixed add about a pint of water, placing it in a slight hollow in the mixture, and stir slowly. The mixture will soon begin to melt and boil, forming a red fluid; stir until the boiling ceases and then add water to make twenty gallons. This stock solution will keep for a while, or indefinitely when thoroughly protected from the air.

Flour Paste.

Wheat flour, four pounds; water, four gallons.

Place the flour in a box with a screen bottom (common wire window screenings) and pour the water through it until all the flour has been washed into the receiving vessel. It will then be finely divided and free from lumps. The mixture should then be brought to the boiling point, being stirred constantly, thus forming a thin paste without lumps.

The Spray.

Sulphid of potash stock solution, 1 gallon; flour paste, 4 gallons; sublimed sulphur, 10 pounds; water to make 100 gallons. Place the above ingredients in the spray tank and keep well stirred while using. A power outfit provided with a mechanical agitator is very desirable in working with this spray. Nozzles of the plug-cock type, which can be cleaned by the simple turning of a valve, are best adapted for the sulphur spray.

Every effort should be made to wet the upper and lower surface of both leaves and twigs, also the interior of the tree. The spray is cheap and material should not be spared.

The above spray was thoroughly tested and found satisfactory in Sutter county in 1903 by W. H. Volck of the State University, and is recommended by him for all cases of red spider not yielding readily to the dry sulphur treatment.

A NEGLECTED FRUIT.

A fruit little known now, but destined to become one of our most valuable articles of food, is the avocado pear, commonly known as the alligator pear, and which flourishes in this region of Florida. That it is coming more to the front as an article of daily diet, was evidenced by the local demand for it during the recent season for it, and its cultivation will likely receive greater attention in the future.

Although strictly speaking a fruit, the avocado has none of the characteristics common to most fruits. The absence of sugar and acid, which con-

stitute the food value of the great majority of fruits, places it in a class with the olive, the value of which lies in its oil.

The avacado is very rich in oil, containing from eight to nearly twenty per cent according to the variety; and like the olive, one has to acquire a taste for it. Upon eating it two or three times, the most fastidious fall into the increasing line of "alligator" pear enthusiasts. The oil is easily digested with most people, and is very nourishing.

The Miami Metropolis published an article on this subject in which it was said that theoretically the avocado ought to be (and this is borne out by the reports of many who know) a fat-producing food, especially in the cases of people who have physically run down by the ravages of disease. But this cannot be taken as a rule to fit all cases. Most all fruits, in fact there are none known, that do not have ill effect on some people.

It is not a juicy fruit, and in its natural state, the edible portion resembles cheese. Being classed with the salad fruits, there are various ways of preparing it, but in Punta Gorda and neighboring towns it is generally eaten with simply pepper and salt, the pear being cut in halves and these sprinkled on it.

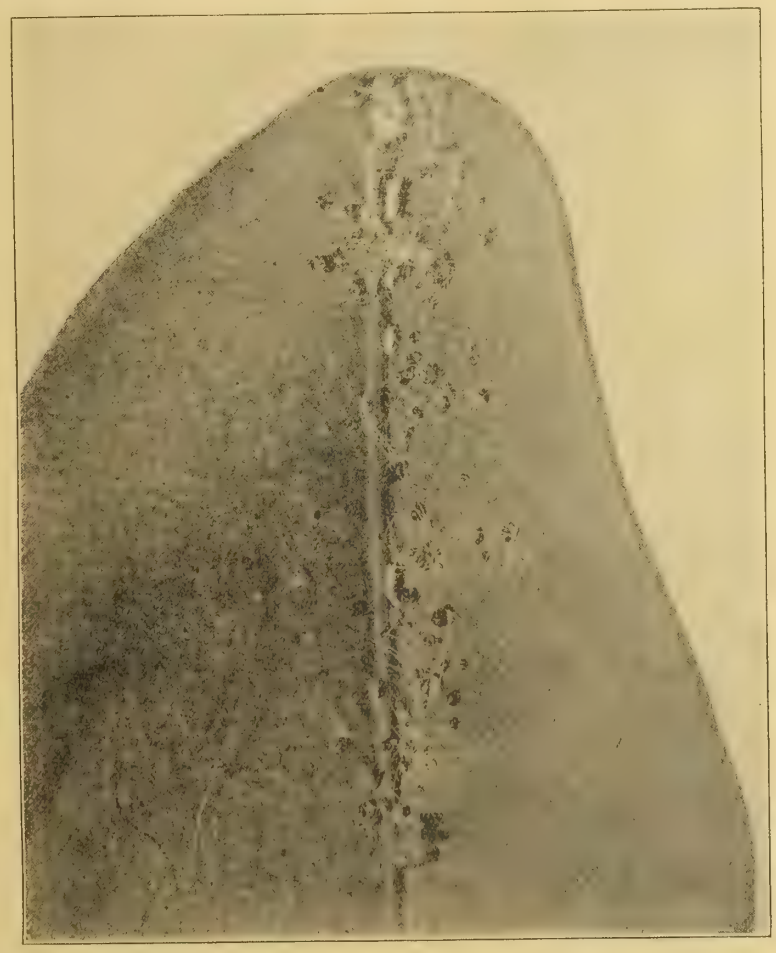
Doubtless the popularity of the avocado will in the near future attain somewhat to the proportions of that of olive oil. So, persons who are wise, will put out avocado trees in corners and other unoccupied parts of their lots about town, and reap the benefits that time will bring to them. —Florida F. and P. News.

The first "run" on banking institutions in London was in 1667. Many Lombard street goldsmiths and bankers had lent out the money intrusted to them and, being called upon for payment, were unable to meet the demand. A crowd of creditors and others assembled, and a riot followed, in which four bankers were hanged at their own doors before order could be restored and the angry creditors persuaded that they were not being swindled.

ICERYA PURCHASI.

In regard to this scale, cottony cushion scale, fluted scale, white scale, attention should be called to the peculiar way in which it secretes honey-dew.

Upon a young orange tree in the laboratory thousands of the young were propagated. These settled usually along the midrib of the dorsal and ventral surfaces of the leaf. At an early stage, a week after birth, the young began to secret honey-dew in considerable quantities, and also numbers of very delicate waxy filaments. Along these latter the subsequent honey-dew passes and collects at the tips in the form of clear transparent globules. The wax filaments vary from ahalf inch to three inches in length, and are so frail that the slightest disturbance of any kind would detach them, and yet they are able to support quite a large drop of honey-dew. Upon the dorsal surface of the leaves these filaments extend in a very confused state, same appearing to be independent of the



Young White Scale on Orange Leaf.

large globules of honey-dew shown in the accompanying cut. The confusion is due to the fact that the filaments not being able to hang down as they are excreted, drop over and are shoved along the surface of the leaf. The honey-dew, passing out along these filaments, collects in the large transparent globules shown in the figure. Those globules isolated, are so, simply because the delicate waxy threads have been blown away.

Such a state of affairs cannot exist in open air because of the disturbances in the trees caused by the wind, for even the slightest breath will blow them all away.—E. O. Essig in Journal of Entomology.

All About the Orange and Lemon

Is told in our new book on Citrus Culture, embracing every phase of the subject from the seedling plant to the final disposition of the fruit in the Eastern market. The largest and best book on the subject ever printed —60,000 words, 100 illustrations. You will want a copy, which we will send you for the small sum of 25 cents. Remember we are the largest growers of orange and lemon trees in the world.

Model Forty-one, $1350.

For Good Roads and Bad Roads

Model Forty-one will travel good roads smoothly, quietly and at any speed. It will travel bad roads safely, easily and comfortably. Its high clearance, large wheels and big tires, its powerful double-opposed motor and full elliptic springs are most appreciated when travelling over rough, muddy or hilly roads. Mr. W. S. Talbot, Broken Bow, Neb., writes: "Roads are never too snowy, muddy or hilly for the Rambler to beat horses, both in comfort and expense."

With this **Rambler**

you can take all the family to the city, to church, or for a call on friends or relatives, even those living fifteen or twenty miles away.

Remove the tonneau, and on the flat platform provided, you can take milk to the creamery, machinery to the blacksmith, fruit and eggs to market, and save time and horse flesh. This Rambler was designed to be converted into a machine-of-all-work as well as an automobile for recreation and pleasure.

The Car of Steady Service

Write today and ask for our farm folder No 156 In it by letters from owners and actual photographs we prove the practicability and economy of the Rambler for the farm. It is free. Write for it now.

Deciduous Fruit Culture

By J. W. Mills

SHIPPING GRAPES.

At a meeting of Lodi grape growers to consider ways of securing better results from shipping grapes, the following address was delivered by G. W. Horsford of the Government service:

"One of the leading orange growers of Southern California said in a recent speech that, in his opinion, the arrival in any market of a few cars of oranges showing any considerable amount of decay reduced the prices received even for sound fruit from 25 to 50 cents per box. Any one who has handled fruit to any extent knows that nothing demoralizes the markets so quickly as the receipt of decayed fruit or fruit which will not hold up until it can be disposed of by the retail trade.

"With the increased production of California table grapes it is becoming necessary to distribute this fruit more widely among the smaller markets of the East. These markets can not dispose of carload lots as quickly as the larger auction markets. In order to develop a profitable trade with them, therefore, it will be necessary to put the fruit on the market in such condition that it will remain sound for some time after unloading from the cars.

"From reports given us by many of our own growers, as well as from our experiments of the past season, we know that you are having trouble with the grapes handled commercially. With a view to determine, if possible, the cause of the decay or rot and to find out how it may be avoided the United States Department of Agriculture has authorized our work with you. For the benefit of those who did not see the experimental lots packed I will describe the plan of the experiments.

"Each experiment contained three different lots. One lot was packed in tight boxes holding about the same quantity of grapes as a regular shipping crate. A filler of finely granulated cork was used with this lot. The cork used was much finer than that commonly used in the grapes imported from Spain. The grapes that were packed in cork were graded and packed by ourselves. We endeavored to cut out all berries split or injured in any way. We took plenty of time and handled them as carefully as we knew how. In part of the places we picked the fruit ourselves. These lots will be referred to as the cork lots.

Another lot was packed in the ordinary shipping crate. In most cases these were packed by the regular packers at the place where we were working. The same grapes were used as for the cork lots. Probably they were packed and graded as carefully and perhaps more perfectly than we could have done ourselves, because they were done by experienced packers. In the first experiments put up the special pack was packed in the regular four basket crate. But when these were opened we found considerable damage had been done in crowding the grapes into the corners of the baskets. After that we used the long cluster basket, two to the crate. Later we found that damage was done in pressing the clusters into the baskets. Accordingly we asked the packers to lay the clusters lengthwise of the basket and to use no pressure in trying to fill corners or in trying to finish the top level and even. We tried also to avoid any pressure of the cover in the specially packed crates. If the crates were very full we used sufficient cleats to prevent the cover from presing the fruit.

The third lot was the regular commercial. In every experiment the grapes used in the cork pack and special pack were the same as those used in the regular pack. About half the experiments were put up at places where they were having reports of decay in their shipments and about half in places where the grapes had a reputation for going through in sound condition.

Half of the packages of each experiment were shipped immediately after packing; that is, they were shipped as soon as possible after packing. In two of the experiments the immediate shipments were picked, packed and shipped the same day, but in most cases the immediate shipment was shipped the day after packing. The other half of each experiment was delayed about two days. The purpose of this experiment was to determine how much decay, if any, resulted from delayed shipment or delayed cooling.

In order to get as nearly an average condition as possible we used three boxes of each, placing one in the top layer, one on the bottom layer and one in the middle layer of a stack. A stack midway from the door to the end of the car was used and all the crates and boxes of each experiment placed in the same stack.

All the shipping experiments went to New York and were examined there very carefully by one of our own men. But in order to make it possible for

Arnott & Company
112-118 So. Los Angeles St., Los Angeles

the growers themselves to see the results we held one crate of each lot at Lodi. They were held in a refrigerator car which was sidetracked near the ice house and kept iced by the Southern Pacific Company. We kept a registering thermometer or thermograph in the car. From the record thus obtained we know the temperature of the car during all the time we had fruit in it. The average of the highest temperature of each day is 40 degrees and the average of the lowest reading of each day 36 degrees, making the average temperature of the car just 38 degrees.

From our records of temperatures of refrigerator cars in actual shipment we know that this temperature is lower than could be obtained in a full car of fruit. We should not lose sight of the necessity for quick cooling of fruit in shipment. But the fact that decay did develop in considerable quantities in this car shows that much of the trouble which develops in shipment can not be overcome by refrigeration. If we are to put fruit into distant markets in sound condition it must be packed properly before it is put into the car. No amount of icing or cooling will save fruit which has been injured in packing or which has been imperfectly packed.

In packing our cork lots we found that in most cases the packers were working with very poor light. In some places the packers faced the light, in others they worked in low sheds upon all four sides and very poorly lighted.

We found also much damage in some places from picking. After packing from a big box we had picked, one packer remarked with apparent surprise that there were only two or three loose berries in the bottom of the box. Many pickers are throwing the clusters into the box carelessly, in many places the boxes are handled roughly in loading and unloading to the packing sheds, and we found in some cases that the lug boxes were filled so full that the clusters were injured in stacking the boxes. The injury from all of these causes is generally a loosening of the berry at the pedicel or stem. This is the hardest kind of an injury to see in culling and most discouraging to the packer because so unnecessary.

In a few places we found it the rule for the pickers to cull the split and decayed berries as they picked in the field. In handling this fruit after them we found a great many berries loosened at the pedicel. Since it is so easy to make this kind of injury and so hard to detect it, we question whether culling in the field is best.

In culling large, close clusters having a large proportion of split and injured berries we found that we often injured the berries around the pedicel. Some lots may have so many defective berries that thorough culling will make it too expensive to handle profitably. It certainly does not pay to ship these lots with all this chance for rot in them.

While we found that some grapes apparently stood some pressure of the cover without serious trouble, there is no question that serious injury is done the general run of grapes in this way. If the crates must be filled so high, put on sufficient cleats to keep the covers from pressing the grapes.

NAPHTHALINE TREATMENT FOR CUT WORMS.

In view of the damage recently done to young vine plantations in several vineyards in the northeast by agrotis caterpillars, commonly known as cut worms, a recent article by M. P. Hoc in the Progres Agricole et Viticole of Montpellier (France) should prove of interest to vine-growers.

M. Hoc deals with the damage caused by another shoot eating insect, Helops lanipes, and describes how young vines were saved from the ravages of this grub by the use of naphthaline at the rate of ½ to 2-3 ounce per vine. He also refers to the use of another insecticide known as vaporite, but it is not obtainable in Victoria.

Naphthaline should be well worth a trial against our cut worms. The drug is obtainable in Melbourne at 4d. per pound wholesale. The earth around the young vine should be removed to a depth of a few inches, thoroughly pulverized, and the coarsely powdered naphthaline well mixed with it. This soil should be employed to reform the protecting mound round the base of the vine, which will, owing to the poisonous vapor of the drug, no longer serve as a shelter for the cut worms during the day time.

Another method would be to apply it in holes a few inches deep on, say, three sides of the vine. As soon as the drug is placed in the holes they should be blocked up with soil. This was the method followed in the case of "vaporite."

It would be well to try a few experiments in order to make sure that no damage is done to young shoots by the naphthaline. According to M. Hoc, up to 2-3 ounce per vine would appear to have had no injurious effect on vegetation.—Journal of Agriculture of Victoria.

* * *

We are informed that Naphthaline a by-product of gas works, is cheap and easily secured in California. We never heard of its trial here. With valuable plants it may be worth consideration.

IMPROVED CASABA MELONS.

These melons are a much stronger grower than either cantaloupes or muskmelons having a much more vigorous and longer root system, hence they will do on soil where the others will not grow at all and stand drough about as well as do water melons. If planted early, that is before the first of May, they will in warm localities produce two crops. If we want a good late melon we plant as late as the first of July.

They will grow and thrive on almost any soil, but do best on a light, deep, sandy mesa soil. While the plants are small they must not be neglected. They need shallow cultivation, not over four inches deep, and somewhat shallower near the plant. A V shaped harrow such as you can make yourself fitted with cultivator handle is better than any other that you can buy. If you make it about five feet wide you can drive the horse along the row if hilled and at each hill lift the wing of the harrow over the hill. If properly done the plants will need hardly any hoeing and the field need not be marked off, except one way, as cross cultivating is not at all needed.

I could write a whole book on the cultivation of melons, but suffice it to say, that in every respect the culture and care of Improved Casabas is identical with that needed for any other melon except that these melons are inclined to grow larger than the market demands. Two plants should be left in each hill and while the distance between rows one way should be at least fifteen feet the other way it should be not more than five except in the late planted ones. Here the distance may be limited to four feet one way and ten the other. The reason for having the distance long one way and short the other is that in that way the plants do not get all the ground occupied at the same time as they do when they are planted on the square plan. That plan is apt to give promise of a good crop, but where we can not irrigate a collapse is sure to come at the time the roots meet on all sides.—J. C. Oestergard.

Future Citizens of Kerman, California

J. W. Brooks, J. B. Deardorff, J. W. Lamb, J. W. Cook, E. M. D. Smith, C. E. Wells, C. F. Anderson and L. W. Brooks, all of Towner Co., N. D. Together they bought 220 acres of land March 18, and will help to make Kerman the richest colony in California.

Do You Know

That the east is burning up with land hunger? That productive lands are getting scarce and hence higher? Do you know that the people east are just beginning to find out that there are agricultural lands in California and hence that we are on the eve of the greatest emigration movement California has ever experienced?

Do You Know

That as a consequence it behooves all who are landless in California but who hope sometime to enjoy the blessings of a landed home, to get busy and to secure the home before the other fellow gets it, and before prices have advanced to where they are prohibitive? That the easterners who are coming here now are astounded with the agricultural possibilities of "New California?" That they are buying themselves, and then going back home spreading the news of their find, and inducing others to come?

Do You Know

That ere long the man who owns productive land here will discover its value, and will refuse to part with it at several times the amount it now takes to "lift" it, and that when that times comes it will be everlastingly too late for many?

Do You Know

That the value of land depends upon what it will produce per acre? That land on the **Kerman Tract** is today the cheapest land in the United States, value of possible products considered? That this fact is becoming known, and that it is bringing more people here than have ever come to any other similar tract in the same length of time?

Do You Know

That the **Kerman Tract excels** when it comes to water right, quality and lay of soil, natural drainage, locaton, and in possibilities for fruit and alfalfa growing, dairying and poultry raising? That it is unsurpassed, if equalled, in the things that go to both home and money making? That it is being populated by the very best quality of people, the cream of the country? That undesirable people are not allowed to buy land here and that those who locate are protected against the scourge which has ruined so many otherwise promising colonies in California? If you do not know these things now

We Are Telling You

And we ask the privilege of further informing you. If you are interested we would like nothing better than the chance to satisfy you upon all these points, either by correspondence or by showing you over the tract. We consider it a pleasure to show interested visitors over the colony, and all comers are accorded courteous and considerate treatment. Our circular explains in detail what is here, and it is free for the asking. Write for it, and do it now. But, what is better, come here and satisfy yourself that the **Kerman Tract** is as represented, and that you are not missing something that cannot be retrieved by not taking advantage of this opportunity now. Either write to

BREAKING UP ALFALFA.

THE attempt to break alfalfa with the ordinary plow is usually a miserable failure, as it is not suited to the work. A very successful alfalfa plow can be made by adjusting and making a few changes in the "regular sod" plow or "prairie breaker."

The essential points to consider are: The long, strong beam, to steady the plow; the long landside, to resist the tremendous cutting strain. It is often necessary to reinforce the beam with heavy iron to withstand the draft. The plow should be adjusted to cut a very narrow furrow, not over twelve inches. An extra long share, to lap part of the last furrow to prevent the roots when only partly cut off near heel, from whipping around. This can also be prevented by the use of a horizontal cutter, bolted to the bottom of the landside, thus partly cutting the roots in the next furrow. This cutter is forged with a right angle shoulder that fits and fastens with the bolt through the short landside.

The next essential is a very sharp share, drawn thin and hardened, so that it will not be brittle. A sharp share should be replaced each day, and a good file is necessary to touch up the edge once in a while. Breaking alfalfa on stony land is very difficult and is extremely hard on plow shares.

The most essential point in an alfalfa breaker is a long, heavy, well pointed share, with a very wide wing, six or eight inches at the heel, and one and a half to two inches of the edge rolled so as to run almost flat on the bottom of the furrow, thus cutting ahead of the "lift" and avoiding a dragging cut.

The standard plow factories are making alfalfa specials for the western farmer, with extra alfalfa shares; these are chiefly in sulky plows; but where it is not practical to afford such a plow, the walking breaker can be fitted and adjusted to do excellent work, although it is somewhat harder for the man that holds the plow.

Alfalfa breaking usually requires from three to four good, heavy horses for a team. The depth and the time to plow alfalfa are somewhat mooted questions. They vary with conditions. It is usually conceded that fall breaking is a success, but in Colorado alfalfa is generally plowed shallow, four or five inches deep, so that the crowns and roots may be well harrowed to the surface to dry out. Alfalfa is then replowed, one to two inches deeper than it was broken. Alfalfa, when dormant, if plowed under in moist soil, will readily take root and grow if not harrowed out. Many farmers are having better success in breaking alfalfa late in the spring, after the alfalfa is ten or twelve inches high, plowing under the green manure. The growth seems to have exhausted the stored plant food in the roots and if they are all cut off, very little growth will be made, especially if the field is planted to some crop like potatoes that can be well cultivated. Complaints about difficulties in plowing alfalfa usually come from sections where rotation with alfalfa has not been customary.—P. K. Blinn, Colorado Agricultural College.

WHAT BECOMES OF THE GRASSHOPPERS?

During the months of August and September our common grasshoppers decrease very rapidly in numbers. Before dying they succeed in depositing, in little holes, which they are able to dig into the earth, eggs, which hatch to continue their kind another spring. The situations most chosen for egg laying are the borders of infested fields, ditch banks, and roadsides.

If the grasshoppers have been abundant the past summer, the farmer should endeavor to determine where the grasshoppers are depositing their eggs this fall. If they have been present in large numbers, it is almost certain that it will pay the farmer well to take some means to destroy the eggs before they hatch in the spring.

If infested ground can be plowed very late in the fall, or at any time during the winter or early spring, and well harrowed, this will probably be the most effectual means that can be used for the destruction of the eggs or the young grasshoppers that hatch from them, as very few of the latter will be able to find their way to the surface of the ground.

In fields of alfalfa or clover, or even upon ditch banks and along roadsides, where plowing cannot be done, the eggs may be very largely destroyed by thorough harrowing of the surface of the ground. The best tool to use for this purpose is the disk. In case of an infected alfalfa field, the benefit resulting from a thorough harrowing of the ground during winter or early spring will far more than pay for the expense of doing the work, besides destroying the grasshopper eggs. If these methods of destroying the eggs were closely attended to year by year, they would prove of more service than all else that can be done to keep grasshoppers in check.—C. P. Gillette, Colorado Agricultural College.

SKIM MILK.

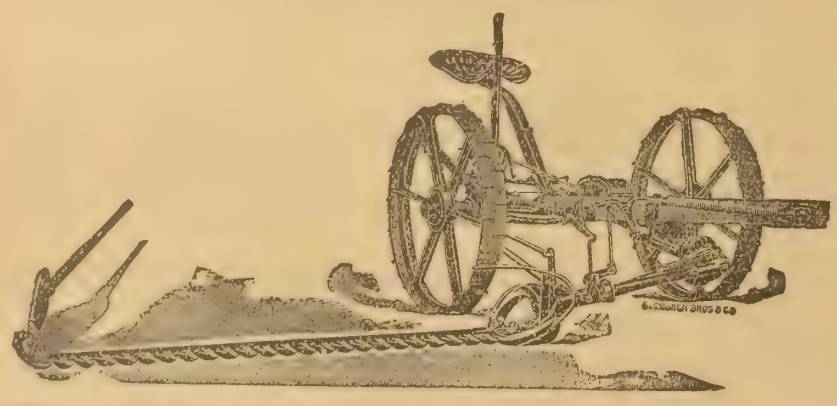
The West Virginia Experiment Station has made some systematic tests to prove the value of skim milk for laying hens. The first test covered 122 days. The 22 hens fed the skim milk laid 1,244 eggs as compared with 996 laid by 22 hens fed a mash wet with water. In another test 60 hens fed the skim milk laid 862 eggs in 37 days, as compared with 632 eggs laid by a similar lot fed no milk. Other tests gave about the same comparative results. The conductors of these experiments estimate under prevailing conditions, with eggs selling at 20 to 25 cents a dozen that the skim milk had a feeding value of 1½ to 2 cents a quart.

Gypsum contains but a small amount of lime and consequently cannot take the place of lime. It was once thought that the beneficial effect of gypsum was due to the amount of lime which it added to the soil, but more recent discoveries have led scientists to believe this is a mistake.

A FRICTION STORY

A small boy can slide faster down a smooth, greased board than he can down an ungreased board full of slivers.

MORAL: A mower which comes closest to eliminating friction will require the least power to operate.



The New Standard Mower

The Cutter Bar is curved when raised, so as to be mathematically straight, to form a frictionless channel for the knife, when lowered. This Bar is patented and can be used only on the New Standard Mower.

The entire weight of the Cutter Bar is transferred through the Suspension Spring to the main wheels. The bar is carried—overcoming the friction of a dragging bar which is pulled or pushed on the ground.

Steel Rollers and Steel Balls surround the main shaft and pitman shaft.

The New Standard Mower develops more cutting power from its special high speed gearing and the grip of the main wheels on the ground than is developed in any other mower—although less power is required to operate it on account of absence of friction.

A folder giving full detailed description of the New Standard Mower and our other Haying Tools will be mailed free on application.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. Minna E. Sherman

CONTAGIOUS ABORTION.

From an excellent address on this subject which concerns all dairymen made before the Imperial County Dairy Association by Dr. J. H. Patton of Holtville, we quote the following with some revisions made by the doctor.

THE literature procurable on this subject is not as exhaustive as the gravity the disease warrants. The United States Department of Agriculture gives us some very good points on the disease in a general way but touch little on the subject of treatment.

Abortion is the term used for the expulsion of the offspring, before it can live, out of the womb. Its expulsion after it is capable of an independent existence is premature parturition. In the cow this may be after seven and one-half months of pregnancy.

Dairymen use the term abortion for the expulsion of the product of conception at any time before the completion of the full period of a normal pregnancy. Abortion in cows is either contagious or non-contagious. It does not follow that the contagion is the sole cause in every case in which it is present. We know that the organized germs of contagion vary much in potency at different times, and that the animal system also varies in susceptibility to their attack. The germ may therefore be present in a herd without any manifest injury, its disease producing power having for the time abated considerably, or the whole herd being in a condition of comparative insusceptibility. At other times the same germ may have become so virulent that almost all pregnant cows succumb to its force, or the herd may have been subjected to other causes of abortion which, though of themselves powerless to actually cause abortion, yet so predispose the animals that even the weaker germs will operate with destructive effect. In dealing with this disease, therefore, it is the part of wisdom not to rest satisfied with the discovery and removal of one specific cause, but rather to exert ones-self to find every existent cause and to secure a remedy by correcting all the harmful conditions. As abortion most frequently occurs at those three-week intervals at which the cow would have been in heat if not pregnant, we may assume predisposition at such times due to a periodicity in the nervous system and functions. Poor condition, weakness, and a too watery state of the blood is often a predisposing cause. This in its turn may result from poor or insufficient food, from the excessive drain upon the udder while bearing the calf, from the use of food deficient in certain essential elements like the nitrogenous constituents or albuminoids, from chronic wasting diseases, from round worms or tape-forms in the bowels, from flat worms in the liver, from dark, damp, unhealthy buildings. In some such cases the nourishment is so deficient that the fetus dies in the womb and is expelled in consequence. Excessive loss of blood, attendent as it usually is by shock, becomes a direct cause of abortion.

Acute inflammation of important organs are notorious causes of abortion, and in most contagious fevers it is a common result. Affections of the chest which prevent due aeration of the blood induce contractions of the womb.

Chronic diseases of the abdominal organs are fertile sources of abortion, especially those that cause bloating or diarrhea, or the diseases of the ovaries, kidneys, or bladder. Privation of water which hinders rumination and digestion; ice cold water, which rouses the womb to contraction and the calf to vigorous movement; a too dry food or a too stimulating food that bring on constipation and straining. Putrid, stagnant water is hurtful both to digestion and the fetus.

Ergotized grasses have long been known as a cause of wide spread abortion in cows. Musty hay causes abortion. Retention in stalls that slope too much behind or over two inches, acts as a strain, the compression due to lying and the gravation backward proves more than a predisposed cow can safely bear. Deep gutters behind the stalls, into which one or both hind legs may slip unexpectedly jar the womb most injuriously.

Aborting cows often fail to expel the afterbirth, and if this remains hanging in a putrid condition it is most injurious to cows in the near vicinity. So with retained afterbirth in cows after calving.

During pregnancy the contact of the expanding womb with the paunch, just beneath it and its further intimate connection through nervous sympathy with the whole digestive system, leads to a morbid craving for unnatural objects of food. In the cow this is shown by the chewing of bones, etc., and also shows a deficiency of lime in the system.

While any of the above conditions may concur with the contagious principle in precipitating an epizootic of abortion, yet it is only by reason of the contagion that the disease can be indefinitely perpetuated and transferred from herd to herd. When an aborting cow is placed in a herd that has hitherto been healthy, and shortly afterwards miscarriage becomes prevalent in that herd and continues year after year, in spite of the fact that all the other conditions of life in that herd remain the same as before, it is manifest that the result is due to contagion.

When a bull living in a healthy herd, has been allowed to serve an aborting cow, or a cow from an aborting herd, and when the members of his own herd are subsequently served by him abort in considerable numbers. Contagion may be safely inferred where living in the same pasture or building does not cause the infection. Cows brought into the aborting herd in advanced pregnancy carry their calves to the full time. But cows served by the infected bull, or that have had the infection conveyed by the tongue or tail of other animals, or by their own, or that have had external genitals brought in contact with wall, fence rubbing post, litter or floor previously soiled by the infected animals, will be liable to suffer.

The contagion is spread only by direct contact. A piece of cotton lodged for thirty minutes in the vagina of

the aborting cow and afterwards inserted into the vagina of a healthy, pregnant cow the latter invariably aborted within a month.

There are cases of tests made in the large stables at Erfurt without any direct intercommunication, but with cows fed and managed in the same way, abortion prevailed for years in the one, while not a single case occurred in the other.

The virus from the cow aborting will cause abortions in the ewe, goat, rabbit and guinea pig, and if it has been intensified by passing through either of the two last named animals will affect also the mare, bitch and cat.

The bacteria of contagious abortion are different and five varieties are reported from different localities. We may reasonably conclude that any microorganism which can live in or on the lining membrane of the womb producing a catarrhal inflamation, and which can be transferred from animal to animal without losing its vitality or potency, is of necessity a cause of contagious abortion.

Symptoms.

As occurring during the first two or three months of gestation, symptoms may escape detection and unless the aborted product is seen the fact of abortion may escape notice. Some soiling of the tail with mucus, blood, and the udder may show extra firmness, and in the virgin heifer or dry cow a few drops of milk may be suggestive, or the fetus and its membranes may be found in the gutter or elsewhere as a mere clot of blood or as a membranous ball in which the forming body of the fetus is found. In advanced pregnancy a cow is dull, sluggish, separates from the herd, chewing the cud languidly, or there may be frequent lying down and rising, uneasy movements of the hind feet or the tail and slightly accelerated pulse with breathing and dry muzzle.

The swelling of the vulva is one of the later signs and is accompanied with discharge of mucus. The milk changes color and becomes a rich creamy yellow. The last two changes come usually two days before the discharge of fetus.

Prevention.

Feed generously of salts, thus correcting the morbid appetite, ground bone and lime. Feed succulent diet (ensilage, steamed food, roots, pumpkins, apples, potatoes, etc.) Sudden changes of food are always reprehensible. Guard against bloating. Three drams daily of chlorate of potash before the recurrance of the expected abortion, has been held to be useful. Separate the aborting cows in isolated building, yard and pasture, allowing no other cows to have access even to their manure, liquid or solid. Scrape and wash the back part of the stall and gutters and water it with a solution of five ounces sulphate of copper in one gallon pure water. This cleaning should be daily.

A cow aborting for three years becomes immune as far as she is concerned, but is still capable of transmission. Dissolve 1 dram corrosive sublimate, 1 ounce each of alcohol and glycerine and shake this up in a gallon of water to use as an injection into the vagina and as wash for the parts about the vulva and the root of the tail. Wash once a day with permangnate of potash in strong solution. This is an excellent vaginal

wash and there is little danger in its use. Exclude all outside cows from service. In purchasing breeding animals, subject them to quarantine and treatment before placing them in the sound herd. An injection of a two per cent solution of pure carbolic acid of 10 cc in the suspected animals is said to be a preventive.

Treatment.

1. Give a hypodermic injection of 10 cc (about 2¾ drams or one third of an ounce) of two per cent carbolic acid solution once a week in suspected animals, and three times a week where the indications are strong and the time apparently short.

2. A vaginal douche of potassium permanganate. One tablespoon full of the crystal to a gallon of water. This will not irritate the epithelial lining and should be used very liberally once each day for a period of three weeks and the treatment should follow each period for three months. The tail and soiled parts should be wiped off and washed with a strong antiseptic solution.

3. The barn and grounds should be rendered sterile by liberal use of five ounces of sulphate of copper in a gallon of water. This treatment with the isolation and proper feeding will go a great distance toward a permanent stamping out of the difficulty.

The bull should be treated with the hypodermic injection of 10 cc of two per cent carbolic acid. The sheath should be washed before and after each service.

Fearful Loss.

When we consider there are in America over 20,000,000 dairy cows and 10,000,000 beef cows and it is said twenty-five per cent of these are afflicted with contagious abortion; thus at least 7,500,000 cows are loosing $135,000,000 annually, or are failing by that amount to produce what they should produce in healthy condition, it is no wonder we are giving this subject much thought.—Dr. J. H. Patton, Holtville.

HARD MILKERS.

This trouble is due to an abnormal contraction of the sphincter muscles at the teat and oftentimes reduces the value of what might have otherwise been a valuable cow as no one wishes to purchase or own what is termed as a hard milker, but if stock owners knew how easily this trouble could be overcome they would never think of disposing of a hard milker at a sacrifice, as is now being done by many.

The mere fact that a cow is a hard milker does not indicate that she is not a good milker, but owing to the fact that she is a hard milker she is oftentimes neglected at milking time by a disgusted milker, who leaves a large quantity of the milk in her udder that should have been drawn out.

Stockmen who know how to handle such cases oftentimes buy valuable cows owing to the fact that they are hard milkers, and by the use of a teat plug and a few treatments for hard milking, cause them to become splendid, easy milkers, thereby increasing their value many more times than the cost of the treatment. A milking tube should never be used in such cases, as there is too much danger of infection and the results are not as good as from the use of the teat plug.—Dr. David Roberts, Wisconsin State Veterinarian.

Nothing else gives such life and staying quality to a roofing as Trinidad Lake asphalt.
Genasco Ready Roofing
is made of Trinidad Lake asphalt and gives lasting resistance to sun, air, rain, heat, cold, and fire. It is mighty important to know what your roofing is made of.

GREEN ORANGE SHIPMENTS.

The shipment of green oranges from Florida has reached a state where an appeal has been made to the State Legislature to protect the growers from themselves by passing a law preventing such shipments. Regarding the matter the Florida Fruit and Produce News says:

"Considerable opposition is being manifested to the bill introduced by Representative Taylor, intended to prevent the sale of unripe citrus fruits.

"The bill in question does not mention the condition of the fruit but sets arbitrary dates between which no oranges or grapefruit can legally be gathered, sold or shipped.

"It is pointed out by the opponents of the bill that much early fruit ripens in the state by October 1 and that the prohibitive period mentioned in the Taylor bill would destroy entirely the value of this fruit.

"It is also stated that the bill would work a great injustice to the southern counties of the state, where oranges and grapefruit ripen much earlier than in more northern latitudes.

"While every possible legal restriction should be placed on the sale of unripe fruit, a practice which has militated seriously against the Florida fruit in the past, it would be well to have a bill drawn with every contingency carefully considered in advance and The Tribune would suggest that Mr. Taylor hear from the people interested in the citrus fruit industry before pressing his present bill."

On the same matter the Tampa Times says: "Bills for the regulation of the shipment of fruit from Florida should be carefully considered by the legislature and passed with great caution. Oranges and grapefruit do not mature and ripen by the almanac.

"It is a well known fact that the thin skinned fruit grown on certain kinds of hammock land ripens and is fit for shipment and consumption earlier than fruit grown on the ordinary pine lands of the state. It should be borne in mind that it is the fitness for consumption that should be the test and not the date of shipment.

"Coloring up by any sort of treatment should be strictly prohibited. Inspection of shipments for a few weeks at the beginning of the season would probably correct and prevent the shipment of green and immature fruit, and if there is much or any fruit ready for shipment at an earlier date than prescribed by one proposed act before the legislature it should be allowed to go forward."

EXTERMINATE THE PEST.

Florida has finally awakened to the necessity of doing something to protect her horticultural interests from insect pests which have heretofore been permitted to circulate over the state without let or hindrance. We have just received a letter from the Florida Fruit and Vegetable Shippers' Protective Association in which they state that a measure patterned after California and Colorado laws authorizing the appointment of county inspectors is before the state legislature and it is hoped will be passed. Florida has been the dumping ground of other countries for all kinds of pests imported on plants. Florida nurserymen have been most indifferent as to kind stock they have sent out. This has aided in the spread of the insects. This is well known to many Californians because circulars have been received in this State from Florida nurserymen urging the purchase of stock and stating that it can be packed and shipped in a way which will evade the inspectors. Such a spirit in face of the fact that many serious pests which Florida now has, have been introduced into this state and are being fought fiercely. A rigid quarantine has been declared against any living plant being brought here from Florida. This all shows the character of some of the nurserymen with which Florida laws will have to deal.

A letter from the Association says: "In California a similar law has been in successful operation for many years and the present success of California as a fruit producing state is due to the fact that such a law is enforced." California's position as a fruit growing state is due to thorough enforcement of its horticultural laws. Florida's awakening is very slow, but we congratulate her that she is finally getting the spirit as is shown by the orange growers in visiting various citrus sections of this state to get the very best information possible on the subject of citrus culture which shows that Florida growers propose to do things more progressively. We hope this spirit will continue and she will become a greater fruit producing state than she could have been under the former method of letting the fruit industry care for itself.

STOCK QUARANTINE.

The State of South Carolina has just enacted a law in which it stipulates that "All shipments of live stock, except those for immediate slaughter, must be accompanied by certificate of health showing that the animals are free from contagious or infectious diseases. This certificate can be issued by the state veterinarian or assistant state veterinarian of the state from which shipment is made, or by a veterinarian in the employ of the U. S. Bureau of Animal Industry or by any competent veterinarian authorized by the State Veterinarian of South Carolina. All health certificates must be in duplicate (these certificates will be furnished qualified veterinarians and transportation companies at actual cost) the original of which must be forwarded to the state veterinarian of South Carolina and the duplicate must be attached to bill of lading for said animals." Further that all cattle over six months of age except those for immediate slaughter must be tested with tuberculin and must be free of all tuberculosis before being brought to the state. This test must be made within 30 days preceeding shipment. A fine of not less than $500 nor more than $1,000, also imprisonment, is the result of violation of the act. The act also allows indemnity for tubercular and glandered animals which are destroyed by the state authorities.

The law can only be beneficial to stock interests of the state and its thorough enforcement will result in a higher grade of stock on all farms.

A LARGE SPRAYING PLANT.

A novelty in the form of a spraying plant has been constructed in the orchard of a large fruit grower in Sacramento Valley, in fact it is said to be the largest pear orchard in the state. The plant consists of pipe lines running through the entire orchard through which spraying material is forced and trees are sprayed direct from the hydrant, located on this pipe line. This has been made necessary from the fact that when necessary to do spraying the ground has been so soft that it was impossible to enter the orchard with a wagon. By means of this system 100 acres of pear trees were sprayed by sixteen men in three days.

There are but few orchards where such a scheme is necessary or advisable. But it shows where yankee ingenuity overcomes obstacles.

CHANGES IN OUR EDUCATIONAL SYSTEM.

"In every part of the United States there seems to be one mind, on the part of those capable of judging, on the necessity of redirecting the rural schools. There is no such unanimity on any other subject. It is remarkable with what similarity of phrase the subject has been discussed in all parts of the country before the commission. Everywhere there is a demand that education have relation to living, that the schools should express the daily life, and that in the rural districts they should educate by means of agriculture and country life subjects. It is recognized that all difficulties resolve themselves in the end into a question of education. The most necessary thing now to be done for public-school education in terms of country life is to arouse all the people to the necessity of such education, to coordinate the forces that are beginning to operate, and to project the work beyond the schools for youth into continuation schools for adults."—Country Life Commission.

SCIENTIFIC AGRICULTURE.

Evidence of the importance which science applied to agriculture is assuming in other American republics was furnished by the First Pan-American Scientific Congress recently held at Santiago, Chile, which was attended by representatives from all of the American republics except Hayti, and at which discussion of subjects related to agricultural education and research formed a prominent feature of the proceedings. A section of the congress was devoted exclusively to the consideration of such subjects, and steps were taken to make this feature even more prominent at the next congress, which is to be held at Washington in 1912.—Experiment Station Record.

Shop Talk

TWO GOOD BOOKS.

Those who have seen "Swine in America" and "The Book of Alfalfa," both written by F. D. Coburn of Kansas, say they find them full of information as an egg is full of meat. Since the recent review of the Swine book several inquiries have been received as to price and we are glad to announce that it is only $2.50. It is a large book of more than 600 pages and profusely illustrated. We will be glad to forward orders for our subscribers at publisher's price. The price of the book of Alfalfa is $2.

Agricultural Notes of the Pacific Coast

Northern California

Bowman, Placer county, is organizing a Farmer's Union.

San Leandro, Alameda county, will have a fine cherry crop.

The wine growers of California meet in San Francisco May 19th.

Prunes about Anderson, Shasta county, promise heavy crop.

San Leandro, Alameda county, will have a cherry carnival July 5th.

Big season for table grapes is the prediction for all Northern California.

Prof. Mackie of the Division of Soil is making a soil map of Sacramento county.

Sacramento County Patrons of Husbandry held a monster celebration on May Day.

Healdsburg, Sonoma county, has just begun the operation of a new creamery.

Loyalton, Sierra county, is considering the proposition of establishing a creamery.

Cherries which have been brought to market have been of exceptionally fine quality.

A large fruit packing house of Healdsburg is being extended and greatly improved.

Vallejo, Salano county, has just formed an eucalyptus company with a capitol stock of $20,000.

The earlier varieties or cherries will be a lighter crop than last year, but later fruit promises well.

The Grape Growers of California will convene in San Francisco, May 19, to discuss methods for protecting the industry.

After all the pressure brought to bear on State Forester Lull the Governor has determined that he shall retain his office.

Engineers Henney and Hopson of U. S. Reclamation Service recently made a tour of the Sacramento valley and inspected the Iron Canyon dam site.

The signing by Governor Gillette of the Wilson bill creating the Yolo Basin Drainage district will results in the reclamation of a great body of fine land.

The flockmasters of Trinity county who won in their recent suit against the county officials who levied a five cent license tax are now willing to compromise on a three cent basis.

Last pay day at the creameries in Humboldt county gave to the producers the following prices: Central 34 and 29 cents; Capitol 29½; Eel River 28½; Grizly Bluff 28½; Pioneer 28.

The state engineer declares that much of the flooding along the Feather river has been caused by deposit of silt from the gold dredgers in the vicinity of Oroville. The damage has been immense.

The apple industry of Humboldt county, especially along the Eel river valley has developed most satisfactorily. One estimate maintains that in the Eel river valley alone there is 250,000 acres suitable for apples.

Orchards which have been planted on the "rock pile" or refuse which is left after dredger mining on lands near Oroville have shown remarakble productiveness and have surprised all those who have observed them.

Central California

Bartlett pears in the Santa Clara valley promise large crops.

Tulare county orange trees are blooming later than usual.

Stanislaus and Merced counties now have a County Farmers Union.

Raisin Day publicity has given impetus to sales of raisin producing properties.

500 fruit growers of San Jose have organized a local of the Farmers Educational Co-Operative Union.

Tulare county is forwarding a large quantity of processed fruit for the exhibit at the A.-Y.-P. Exposition.

No material advance in price is noted in the prune market, but it is thought a slightly better tone prevails.

The Coast Creamery at Fresno has been taken over by the California Cream and Butter Co. of Los Angeles.

The Kern county creamery has placed an order for a motor truck to be used in the 50-mile route of gathering milk.

Hay buyers over the valley seem to be cautious and a feeling of uncertainty seems to prevail as to price of this season's hay.

Stockton is making experiments in rice culture. One farmer has a couple of acres planted within two miles of that city.

The citizens of San Jose expect to entertain the officers of the Japanese cruisers by giving them a trip through the prune orchards.

Tulare county reports, peach crop will be heavy, apricot light, or at least not up to normal, and prunes an unsually light crop.

Reports generally over the valley indicate that the rain yield will be lighter than usual, but that the hay production will be a bumper crop.

50,000 of the little recipe folders put out by the Rasin Committee were shipped to Chicago and distributed through the retail grocers of that city.

A large ranch near King City, Monterey county, has purchased a large number of race horses from the defunct Emerysville race track and will enter extensively into horse breeding at King City.

Tulare county citrus groves infested with the thrips are receiving an inspection from the hands of an expert from the Bureau of Entomology. No suggestion has yet been made as to the possible control.

The recent organizations of the prune growers is proceeding with details of working out scheme for marketing next season's crop. A commission of five is working along the line of forming district associations.

Six post cards were received by the Raisin Committee at Fresno from San Francisco stating that the writers would not eat raisins on Raisin Day because of the fact that Fresno had "gone dry" at the recent saloon election.

At the recent meeting held at Turlock for the purpose of forming a district organization of the union made up of Stanislaus and Merced county locals, a large attendance was given and questions of marketing everything from raisins to watermelons were discussed.

Southern California

Shipment of Valencia oranges has already begun, earlier than usual.

The Yorba Reservoir in Orange county has water of a depth of 40 feet.

Thermal, Riverside county, is shipping car load lots of onions to Tacoma, Wash.

A new vegetable shipping association on a co-operative basis is soon to be formed.

The Brawley string bean growers have found string beans a profitable crop this season.

Shipments of Imperial hogs will begin about June 1st. The Valley will market about 50,000 head.

It is now thought that a greater part of the cantaloupe output of Imperial Valley will be shipped in July.

The Palo Verde Valley has already cut a splendid hay crop which shows some of the possibilities of that new section.

Riverside recently struck highwater mark in shipment of oranges sending, in one week, an average of 52 cars per day.

It is estimated that in Southern California there are 25,000 acres of orange trees planted which are not yet in bearing.

The citizens of San Jacinto recently held a mass meeting to discuss means of bringing a beet sugar factory to that section.

The Directors of the Richland Walnut Growers Associations have appointed brokers to handle its crop for the coming season.

Improvements along the Santa Anna river conducted by the Santa Anna River Development Co., it is estimated will cost about $200,000.

Irrigators near Olive, Orange county, have recently installed a reservoir which cost $12,000. It will be a great aid in the control of irrigation.

Oranges are still growing forward in large quantities, usually about 200 cars per day. The price is not discouraging, but hardly up to the desire of the growers.

Under the management of the walnut association the marketing of walnuts has become more profitable. The price has advanced from 9 cents which it was a few years ago, to 10, 11 and last year to 12½ cents.

The recent withdrawal from entry by the Government of 860,000 acres of irrigable land in Riverside and Imperial counties gives color to the report than the high line canal will soon be constructed from Laguna dam.

The acreage in cantaloupes has shrunk considerably from the five or six thousand acres estimated at early planting time. There are now only about three thousand acres and these are bearing lighter crops than anticipated. The reduction in acreage is due to a poor stand, caused by cool weather and winds.

The only native palms grown in California grow near Palm Springs in Riverside county and many of them have been destroyed by the curious setting fire to the dead leaves which hung about the trunk. The burning is also done by the Indians on death of a member of the tribe when the fire is set presumably to frighten away evil spirits.

The Coast

Alaska is buying heavily on Seattle, Wash, hay market

The annual horse show at Dayton, Wash., was held April 24.

Fur farming is becoming a great industry in Western Canada.

The Roosevelt dam in Arizona has reached an altitude of 132 feet.

Much of the Willamette valley wool was sold at 22 cents for best grade.

17th National Irrigation Congress will be held in Spokane, Wash., Aug. 19th.

Dispatch from Spokane, Wash., says the recent rain was worth millions.

Yakima valley, Wash., reports an exceptionally light peach crop owing to sever winter weather.

Fruit inspectors in Oregon are making a more strenuous enforcement of fruit tree inspection laws.

F. H. Newell, director of the Reclamation Service, is inspecting the government work near Phoenix, Ariz.

Peach growers in the Rogue River valley are pleased that the hard winter freezes did no injury to the peach crop.

Rain visited sections of Pullman, Washington, about the first of the month and was of great benefit to the crops.

The weather for the past few weeks has been exceptionally favorable to the winter wheat crop at Colfax, Wash.

Vancouver, Wash., health inspectors have been after the dairies and a thorough cleaning up has been demanded.

Prospects for the fruit crop at Walla Walla, Wash., are excellent. Extensive spraying has been given to all apple orchards.

Lewiston, Idaho, will market fully a million pounds of wool and at a price it is expected not far from 20 cents.

A carload of Los Angeles strawberries recently sold in Seattle at about $2.25 a crate. It was reported as of exceptionally fine quality.

The appropriation allowed by the state legislature at Washington for its state college was cut $100,000 short of the estimate of the regents.

Over 2,000,000 pounds of this spring's clip of Oregon wool has already been sold or contracted for. Some contracts have also been made for the next clip.

The Spokane County Farmers Union recently met at Medical Lake, Wash., and appointed a committee to look up the matter of binding twine, and grain bags

The Colonization Board of Italy is in correspondence with the Board of Trade of Phoenix, Ariz., to secure information as to the desirability of lands in that territory.

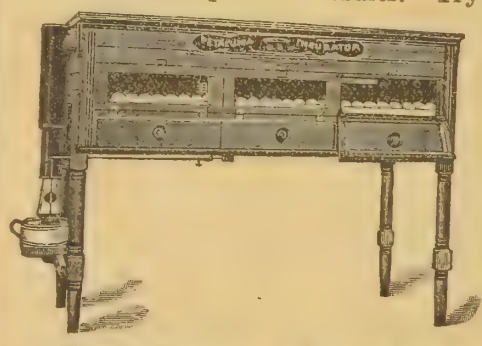
Prune trees of Clark county, Wash., have been troubled with practically all of the blossoms dropping. The matter is being investigated by experts from the State University.

A serious spread of tuberculosis among fowls in Oregon is reported. The poultry men are greatly concerned and the State Board of Health is taking a hand in the effort to control it.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. You ***can't*** afford to try and be successful and not get results. ***Midland Poultry Food*** will produce results. Try it and see. $1.95 per sack



Petaluma Incubators and Brooders

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Petaluma Incubator Company

Petaluma, California

Our General Agents for Incubators and Brooders and Midland Poultry Food:
Petaluma Incubator Co., Petaluma, Cal.
Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles
Berrar & Robertson, San Jose, Cal.

When the chicks are hatched don't feed them anything for 24 hours, then feed them the best dry Chick Feed you can get. We say that is

West Coast Chick Feed

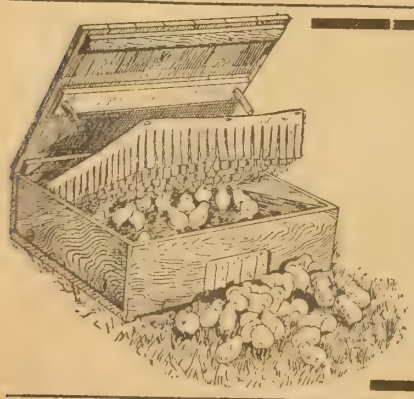
SAMUEL R. KELLAM, former president of the L. A. Co. Poultry Association, says: "West Coast Chick Feed is the best feed for young chicks I have ever used. I have given this feed a thorough test, and have always found that it produced fine, large, healthy chicks."

MRS. A. BASLEY, the celebrated poultry authority, says. "I want some more of your West Coast Chick Feed, for it is excellent. It is purer, cleaner and appears better balanced than other feed I had been using, and to tell the truth, I have been experimenting, feeding both together, and they always eat yours in preference."

Ask your neighbors, for there is more of "West Coast" sold in Southern California than all other kinds put together. If not sold by your dealer send us $3.50 and we will send a 100 lb. sack, freight prepaid within 300 miles.

West Coast Mill

705-709 So. Griffin Avenue, Los Angeles, Cal.



Poultry Supplies and Seeds

Petaluma Incubator and Brooders, fireless brooders, Midland poultry food, Steinmesch chick feed, Swift's beef scraps. Send for our large illustrated catalogue of poultry supplies and seeds, it is free.

Starbuck & Son's Heavy Laying Barred Plymouth Rocks

We now unhesitatingly make the proud boast of the best laying strain on the coast, if not in the world. We will publish prices later.

Do you want to hear about our beautiful prize-winning Buff Orpingtons and Silver Wyandottes. We have something to crow about.

Wm. Starbuck & Son, Fullerton, Cal.

Stanislaus county is contemplating improvements of water system from the Hetch Hetchy valley.

The ostrich farm heretofore located near San Jose is to be transferred to Sacramento.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

DETRIMENTAL CHANGES IN EGGS.

Dirty Eggs.

Dirty eggs are grouped roughly in three classes—(a) "plain dirties," those to which soil or dung adheres; (b) stained eggs, those soiled by contact with damp straw or other material which discolors the shell (plain dirties when washed usually show this appearance); (c) smeared eggs, those covered with the contents of broken eggs.

For the first two classes the farmer is to blame. The third class originates all along the route from nest to consumer. The percentage of dirty eggs varies with the season and weather conditions, being noticeably increased during the rainy weather. About 5 per cent of all eggs are culled out as "dirty," and these are sold at a loss of at least 20 per cent. This makes a financial loss of 1 per cent of the total value of the nation's egg crop.

There is another loss caused by dirty eggs which is fully as serious. It is the loss due to the fact that in a lot of eggs so handled as to produce 5 per cent of "dirties," the remainder of the lot will show enough spotted and tainted eggs to give the whole lot an inferior appearance. The amount of depreciation from this is difficult to estimate, but this is undoubtedly as great as the direct loss on those culled out.

Broken Eggs.

The common trade name for cracked eggs is "checks." "Blind checks" are those in which the break in the shell is not readily observable. These are detected with the aid of the candle or by clicking the eggs together. "Dents" are checks in which the egg shell is pushed in without rupturing the membrane. "Leakers" have lost part of the contents and are not only a loss themselves, but produce smeared eggs.

The loss from mechanical injury varies considerably with the amount of handling in the process of marketing. A western produce house collecting from grocers by local freight will record from 4 to 7 per cent of checks. These same eggs in further handling will have an additional checking of 1 to 3 per cent. Eight per cent. of the eggs from hen to market is probably a fair estimate for broken eggs. The depreciation of such eggs is greater than that of dirties, being about 25 per cent. This gives a financial loss due to checks of 2 per cent.

ROUP.

How discouraging it is when our young chicks are attacked by the gapes, lice, bowel trouble, etc., any one of which will cause great loss. How much more discouraging it is to have the fowls grown nearly or quite to maturity and have a roup epidemic. This disease usually shows itself in the fall or early winter and unless vigorous efforts are made it is liable to remain all winter.

The loss of a matured fowl is more than the loss of many little fellows and we must avoid the disease if possible.

It is entirely unnecessary to have expensive, air tight buildings in which to keep the fowls confined most of the winter months, just good, dry, comfortable quarters with plenty of fresh air and no draughts are all that is necessary.

Lice, filth of all kinds and damp, frosty walls are not conducive to good health in poultry.

As an ounce of prevention is worth several cures let us see that we have no unsanitary conditions in our yards and buildings.

If a fowl gets the roup do not wait for Nature to take its course and the whole flock get it, but head off the outbreak by disposing at once of the sick bird. Better kill and burn them, I think.

No matter how valuable the fowl just remember that value is gone as a breeder after a severe attack of roup.

A good many years ago a dear old friend said at the first appearance of cold put a little kerosene oil in the drinking water, make a little extra effort to keep the quarters clean and well ventilated and you'll never have the roup. I believe she was right.—Poultry Tribune.

TIMELY NOTES.

Cleanliness is an enemy of disease.

Better have the poultry a little hungry than overfat.

Poultry soon become accustomed to regular hours of feeding.

Charred corn occasionally makes good feed.

The greatest objection to using sloppy food is that it often makes conditions which invite disease.

The poultry business won't run itself any more than other business. No gains without pains.

There's a lot yet to know about poultry. It's surprising the small amount of real practical, dependable knowledge at the disposal of the beginner. The poultry business has had little benefit of governmental and scientific research. We'd all better think about how little we know than to spend so much time in crowing about what we do know.

Let all the hens run together after the conclusion of the breeding season, and separate the males. This not only simplifies the labor but gives both sexes a beneficial rest. What few eggs they lay will be all the better for table purposes and will keep better.

Be sure and plan to grow some sunflowers in the poultry runs this summer. They make good shade and the seeds will be especially valuable to feed to the hens during the molting period.

If it is worth while to set a hen at all, it is worth while to set her well. Give her a good nest, secure from disturbance by other hens, feed her regularly each morning or evening, and nine times in ten a very good hatch will result.

To prevent small runs from becoming foul and unhealthful, divide them and keep something growing in one part all the time, confining the fowls to the other part, and changing around every few weeks.

Feeding fowls in summer requires careful judgment. Old fowls and chicks should not be allowed to run together. The former will get too fat and the youngsters starve half of the time. See that all ages get plenty of green stuff.

Don't forget about the lice. There may be thousands of them in your poultry house or on your birds before you find one. Lice do not particularly try to "show themselves" and usually are hard to find. But it is ten to one that they are there just the same, and don't be too sure your fowls are free from the pests. Look for them every week or two and take measures to prevent them from getting started. Lice killers are plentiful and cheap and they save a lot of money and dissatisfaction by preventing losses.

Lazy men make poor poultrymen. The poultry business will not "run itself."

Crowding and bad ventilation are the source of many losses in flocks that are otherwise fairly well managed.

Heavy dews on the grass will wet young chicks and turks just the same as showers. Remember this before you let the broods out in the morning.

The best way to kill off lice is to prevent them from getting a start. It is much easier to keep them in check than to give them a chance and then fight them after they are swarming over the whole house and all the fowls.—Poultry Tribune.

THE CHAFF PILE.

Keep the chicken house clean, the nests clean, clean the roosts, clean the floor, clean the troughs and pans for feed and water, clean the yards. Clean everything.

The poultry house may be built of almost any material. The question of what to build with is not so important as how to build. Whatever the material, the house must be warm, well ventilated, and must have plenty of light.

Success in poultry raising, as in any other business, depends largely on the attention given to details.

Inbreeding is the source of much trouble in many poultry yards.

Scaly leg spreads rapidly, particularly when the fowls are kept in close quarters, and the wise poultryman will lose no time in administering treatment to the first fowl that shows any signs of this disease.

Carelessness and inattention may result in poor hatches from good eggs of strong and healthy stock.

Charcoal is of great value in the poultry yard as a purifier and tonic for the flock.

Hens cannot be expected to produce eggs all the time. They must take a rest some time, although the hen that prolongs her vacation should be disposed of.

Changing from one breed of fowls to another may not be conducive to success. The poultry breeder that cannot make good with one breed would not be likely to do well with another.

Most hens on the average farm have egg records somewhere around the 100 mark. The right kind of hens ought to be producing 150 or more.—The Ranch.

White shelled eggs hatch easier than the brown shelled, in the incubator, it is claimed.

If the hen does not lay, it is in some way your fault, for it is her business to lay eggs.

Coulson's POULTRY FOODS

Special Dry Chick Food

Makes Them Grow

Throw it out in the Litter and Make them Work

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequaled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the present high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed, to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE-SAVER. Write us for free samples and prices.

POULTRY QUERIES.

Beginner's Troubles.

Am hatching White Leghorn chicks with hens. While hens are sitting I dust them including nests and eggs with dry sulphur every four or five days. When chicks hatch I put a little sulphur and lard on head and under wings of each and also hens. Place them in a coop which has been thoroughly saturated with coal oil. At the end of about two days, I place before them plenty of pure water, grit and I. X. L. chick food. At the end of a week I allow them to run with hen in orange grove during warm part of day, closing them up at night from drafts. I feed nothing but chick food mentioned until about three weeks old, when I feed wheat once a day in connection with chick food. Take pains to keep coops clean at all times. Have also rubbed hen thoroughly with sulphur and lard, and yet I occasionally discover a louse on her.

The chicks come out every morning with their eyes stuck together—not all, but a large proportion. I wash their eyes with sweet cream and afterward oil with vaseline, which helps them, yet others are continually affected. Some of the strongest chicks, too. What causes it and how shall I prevent it? Also what shall I do to eradicate the lice? I have lost only one chick so far, but several appear droopy and seem to have bowel trouble.—C.Y.

I wonder that the sulphur and lard did not kill the little fellows out right, as it is too strong for them, and the lard is fully as effective without it. Get some fresh, now mind F-R-E-S-H Persian insect powder, and dust with that instead, while the chicks are small. I used to stand over my druggist and see him grind it myself to be sure it was fresh. I was like the lady who found an honest butcher, and stood by him—while he was weighing her meat. Grease and hot sun seem to hurt chicks, if applied too freely, but I am afraid your coop is too close at night, is the reason for their eyes being stuck up so mornings. Still, lots of children have this same trouble and out grow it, and I presume your chicks will. Give the hen a good bath in a solution of carbolic acid water, a teaspoon to a pint of water, and if you wet every single feather to the skin it will kill all the lice on her and a weaker solution won't hurt the chicks a bit if done in the heat of the day, or else use the tobacco tea as advised for Mrs. W. B. not for chicks, though only mature stock, this.

The louse killers advertised in the columns of Cultivator to be put on boards under the chicks at night, are often entirely effective also. And so handy to use, the fumes arising from them being sufficient to clear the lice out for the time.

The bowel trouble may be helped by feeding raw eggs. Just mix the egg stiff with wheat bran, and the chicks will eat it greedily, and it corrects the bowel trouble as few things do.

I would suggest a little meat fresh from the butcher and ground up in the family mill twice a week. My butcher gives me a nice piece for five cents and how the babies relish it.

Onion tops ground up the same way are excellent and keep lice down if fed every day, as lice do not like the flavor of onions in their food. I think you have been very thorough in your work for a beginner, and hope you may succeed, as you seem to deserve. —Mrs. F. M.

Feed often and feed but little at a time, is said to be a good rule for feeding young chicks.

Don't place dirty eggs in the incubator. Filth generates gases that ruin many of the fertile eggs.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Summer Pruning.

I have a number of sugar prune trees heavily set with fruit which were not pruned last fall. Will it injure the tree or fruit to prune at this time? What is the meaning of "summer pruning" and in which month is it done? Is it done when the fruit is on the tree or after harvest? Is lime and blue stone a fertilizer and will it be wise to apply it to the roots of trees and if so at what time should it be applied?—J. H. S., San Jose.

Summer pruning is usually done after the fruit is off the tree. More particularly is this the case with apricots for as soon as the fruit is off, early in July, they are sometimes given a heavy cutting back then thoroughly irrigated and this sends out a vast quantity of new growth with large healthy buds which give promise of a big crop the following year. Other deciduous trees are sometimes treated in the same way although not to the same extent that we treat the apricot. We anticipate, however, that you refer to pruning-shear thinning of your fruit. That is done where trees are heavily loaded and will break with the excess of fruit by severe cutting back of the longer limbs. If, however, the trees have been properly pruned and have no exceedingly long limbs which will pull the trees out of shape under the weight of the fruit, then the best thinning is done by thinning and reducing the number of fruits to what the tree will bear and give a large size. This should be done as soon as you are reasonably certain that the natural dropping has ceased and in any case before the pits begin to harden. We do not see any practical value in lime and blue stone as a fetilizer. Most California soils are supplied with plenty of lime although it has, at times, shown to be beneficial. Blue stone possesses nothing which would be of any great value to the trees.

Fly Repellants.

Flies worry our cow very much. Can you give some method of abating the nuisance?—R. H., Bakersfield.

As these queries will doubtless increase in number we give a somewhat extended answer. Give the cow a dark shed in which to run, if possible. This may be so arranged with burlap hung down well over the opening and the cow will be at liberty to go and come, yet the darkness prevents flies from annoying the animal all the time. As a preventive, it is always wise to keep manure piles well cleaned up. Sprays which are sold by many dealers are usually to be commended. However, for those who wish to make their spray the following, which appeared in the Cultivator last June, is given. If any of our subscribers tried it we would be pleased to hear as to their success.

Fish oil 100 parts, oil of tar 50 parts, crude carbolic acid one part.

This formula is recommended by the South Dakota Experiment Station which reports it most effective. It is sprayed on to the animals by means of a small hand spray pump, one application being sufficient for two days. The longer between spraying the more thoroughly the animals must be gone over. The odor of the preparation does not taint the milk, but it must be removed from the barn at once after milking, which should be done whether a spray is used or not.

Aphis.

How can I get rid of green lice on pea vines? What remedy can I use on rose bushes that have mildew, whitish in appearance, also a similar mildew that effects the growth of apple trees? Can you suggest method for overcoming depredations of deer in young orchard? We have been trying to get him in all sorts of ways but failed to get even a sight.—F. A. T., Soquel.

Green lice or aphis may be controled or rather somewhat subdued by using kerosene emulsion or whale oil soap. Sulphur scattered over the rose bushes will be effective especially when warm weather comes and causes fumes to rise from the sulphur. Spraying with Bordeaux mixture earlier in the season will prevent its spread to a great extent and could also be used to advantage on the apple. The deer problem surely is a hard one as we have never heard of its being a factor with orchardists in this state. We imagine our subscriber could have plenty of help to come and "lay" for the deer if there is any reasonable probability of getting a shot at him. Personally, we would prefer to capture and make a pet of him.

Red Ants.

Is there any remedy for red ants on lemon and orange trees also green lice on rose bushes?—J. J., Kerman.

Red ants may be reached with any of the kerosene or whale oil soap sprays though, perhaps, the best treatment is to find the hole where the ant makes its home and kill the colony by using bisulphide of carbon. However, as a rule, we do not think you will find the ants have injured the trees. They always are in large quantities where black scale or aphis collect because both these pests which are injurious to trees exude a large quantity of honey dew which is attractive to the ants. The aphis and scale may be reached with a spray of soap or kerosene.

Garlic and Other Vegetables.

I would like to ask directions as to the culture of garlic, the time to plant seeds or sets and time of the year to plant to get the highest prices. I note the present market price is 12½ cents. Would also appreciate list of other vegetables which may be planted from now on. Have five acres of orange land and I hope income in vegetables will assist in paying for it. I wish to grow for Los Angeles market.—J. E. M., Ontario.

Garlic is a vegetable mostly used by foreigners and one wants to be pretty sure of a market before growing it in any considerable quantity. It is of the easiest culture, growing freely on any soil suitable for onions, but onions require very rich soil to produce a profitable crop. Garlic is propagated by divisions of the bulbs called "cloves or "sets." They should be planted early in the Spring—which means February and March here—in rows one foot apart and four to six

Madary's Planing Mill,

Fresno, California

inches in the rows. The crop matures in July and August, when it is harvested like the onion, except that it is always sold in the dry state. I would consider it now too late for a successful crop for this season and especially when attempted by one having but little experience. The foreign population around the querist's own home would afford, in my judgment, a better market than Los Angeles, especially when attempted by one having but little experience. In my opinion it would be far more profitable for the querist to make his plans to grow vegetables for his neighborhood than to think of growing for the Los Angeles market. It is hard enough for the experienced grower, well established, to hold his own in the Los Angeles market. In this querist's case the freights and commissions would absorb all profit. Let him visit the gardeners who supply his locality and carefully observe how they do, and I think by careful honest methods he can build up a retail custom in his own neighborhood that will be much more profitable than to attempt to ship to Los Angeles. If he has learned a great deal in the seven weeks he has been in California what will he know after he has been here a year? By this I mean that it may be wise to go a little slow until one learns more of the conditions that prevail in a climate so radically different from Boston. The season is now past for the planting of many crops, but there is yet time for enough to keep one busy: Sweet corn, tomatoes, melons, sweet potatoes, beans, and all other vegetables that would be planted in the querist's old home in May can yet be grown, and some of them, as sweet corn and beans, can be planted in succession of intervals of three or four weeks apart. Proceed with caution until you have learned more of climatic conditions. Grow for your home locality and thereby get the retail price. Visit local growers and observe their methods and do not undertake too much until you have learned more of local conditions.—Q. A. L.

Worms Climbing Trees.

I think I read in the Cultivator sometime ago of an arrangement used around the trunk of trees and shrubs that will prevent worms, etc., crawling up the trunk and destroying the tree. If it will prevent cut worms or army worms doing so much damage as they are doing to trees and shrubs just now, your recommendation will be gratefully received.—J. J. F., San Diego.

There has been advertised a "tree tanglefoot" which is said to be exceptionally satisfactory as a preventive of insects climbing trees. It is smeared in a band around the tree and prevents practically all insects from climbing up.

Aphis.

I am sending leaves infested with small insects. They are quite thickly scattered through the orange trees. What are they and are they injurious? They are very thick on the young sucker growth.—Mrs. F., Highland.

The insects were duly received and are the plant louse or aphis which has been exceptionally persistent this entire season in all parts of California. They are easily killed, but reproduce so rapidly that the next generation populates the growth again. They secure their living from the sap which they extract from the young, tender growth of plants and trees. Whale oil soap or kerosene emulsion will kill them.

Fly Repellant.

Please give me formula for spray for cow to prevent flies attacking her. —Santa Cruz.

See answer to a similar query on preceding page.

Essex Hogs.

Where can I secure thoroughbred Essex hogs?—L. F. W., Monrovia.

The Cultivator has no information as to Essex hogs and asks for communication from subscribers.

Planting Peanuts.

Please tell me how to plant and care for peanuts.—K. K., Thermal.

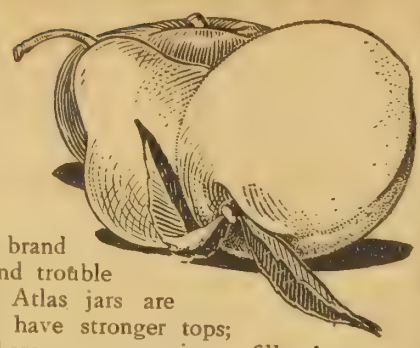
Dealer in All Kinds of Beekeepers' Supplies

The Best Jar For All Kinds Of Preserving



bears the name "Atlas." Use Atlas brand Jars and much of the uncertainty and trouble of preserving time will disappear. Atlas jars are better glass; have stronger tops; seal surer and are more *convenient* to *fill* and *empty* than any other name or make of jars. The

ATLAS
E-Z Seal Jar
(Lightning Trimmings)

is an especially good one. Machine-made and therefore perfectly smooth at the top—No danger to the hands and no particles of glass to fall inside when using the E-Z Seal Jar. It has a wide mouth and takes in large fruits without cutting or crushing them. The

ATLAS SPECIAL MASON

also has a wide mouth and is an equally good jar, but closes with a screw cap.

If your dealer cannot supply these jars, send $3, and we will express prepaid thirty (30) quart size ATLAS E-Z SEAL JARS to any town having an office of the Adams or U. S. Express Co., within the States of Pennsylvania, New Jersey, New York, Delaware, Maryland, Virginia, West Virginia, Ohio, Illinois, Indiana or Michigan, or we will quote delivery prices in other portions of the United States by freight or express.

A Book of Preserving Recipes
Sent free to every woman who sends us the name of her grocer, stating whether or not he sells Atlas Jars.

HAZEL-ATLAS GLASS CO., WHEELING, W. VA.

Household Department

DYING IN HARNESS.

Only a fallen horse, stretched out there on the road,
Stretched in the broken shafts and crushed by the heavy load;
Only a fallen horse, and a circle of wondering eyes
Watching the frightened teamster goading the beast to rise.

Hold! for his toil is over—no more labor for him;
See the poor neck outstretched, and the patient eyes grow dim;
See on the friendly stones how peacefully rests the head—
Thinking, if dumb beasts think, how good it is to be dead;
After the weary journey how restful it is to lie
With the broken shafts and the cruel load—waiting only to die.

—John Boyle O'Reilly.

TROUBLE IN THE HOUSEHOLD.

IT WAS after dinner. The young man who had not been married very long sunk down into his brand new Morris chair with a sigh of comfort. He had on his brand new smoking jacket and his brand new house slippers, and as he gazed at his wife in her pretty and also brand new gown he felt very well pleased with himself and with life.

"That was a dandy dinner," he remarked.

He was a little surprised that the compliment did not draw her to his side, as such remarks usually did. She remained sitting in the weathered oak rocker and looked absently from her embroidery.

"Was it?" she inquired.

"Fine!" said the young man, with tremendous enthusiasm. He did not exactly understand why, but he felt an impulse to be blithe and emphatic. He felt there was something in the air.

"I am glad you liked it," said his wife.

The young man coughed and picked up the newspaper. For five minutes he read the advertisements upside down, frowning. He was thinking that Mabel certainly did not act as usual.

"Have you a headache?" he asked anxiously.

The young woman in the weathered oak rocker gave him a brief and fleeting glance. "I feel very well, thank you," she said, politely.

"Oh!" said her husband, a little blankly. "I'm glad. I didn't know. I—er—just thought I'd ask."

Over the edge of the paper he sent inquiring glances at her. He had never noticed it before, but when she looked down, as she was doing now, Mabel's profile certainly was severe. Perhaps it was because he was used to seeing her laugh. Now that he thought of it she hadn't laughed all during dinner. He wondered why.

"Were you alone all day?" he asked diplomatically. "Were you lonesome?"

"Three of the girls were here all afternoon," said his wife. "We had a very good time. No, I was not lonesome.

"Well—what—has anything gone wrong?" asked the young man.

"Oh, dear, no." said his wife, with polite carelessness. "Why, what could go wrong?"

"I didn't know," said her husband, "I though something might. Things do sometimes, you know. I thought you seemed so quiet."

"Oh, do I?" asked his wife, turning her embroidery about.

The young married man held his head. A horrible feeling of helplessness was stealing over him. He wondered with a sort of chill if this was a natural thing and to be expected. Maybe Mabel had grown tired of him already. Perhaps it was the usual thing to have one's wife grow cold and abstracted after a few weeks. But a whole lifetime of it!

The young married man made a great fuss over getting a cigar and lighting it, wandering around the room as he did so. When he passed Mabel he touched her hair lightly as he had a way of doing, but no answering upturned face resulted. Maybe she did not notice it, he concluded, for the touch was very light.

"I saw Billy Hamline today," he began briskly, as he sat down again.

"Did you?" said he wife.

"He told me a big piece of news," went on her husband desperately.

"Did he?" said his wife.

"See here," said the young married man hurriedly, "what's the matter, Mabel?"

"Nothing is the matter," said his wife.

"Yes, there is!" protested her husband. His tone was tinged with alarm. "Tell me what it is!"

"I don't see why you should think anything is the matter," protested his wife, raising her chin a trifle.

"Why, you act so odd!" insisted her husband. "Not a bit like yourself! I wish you'd tell me!"

"I'm surprised," said his wife with her chin still higher, "that you should even notice how I act."

"Why, Mabel?"

"Yes, I am! You—you've shown plainly enough—well, never mind!"

"Now, Mabel!" cried the young married man, standing anxiously before her, "tell me instantly what's wrong! What have I done?"

"You—you f-f-forgot to k-k-kiss me when you came home tonight for the f-f-first time since we were married!" sobbed his wife, dropping the embroidery and hunting her handkerchief, "and nev-never once said you still l-l-loved me! I think that's enough!"

"Great guns!" said the young married man contritely and relievedly. "I believe I did forget. What a villian I am!"

ALTERING CHILDREN'S DRESSES.

When you come to look over your little girls wardrobe this summer you will find that many of the little garments are so badly outgrown that they cannot be used again without being remodeled, and often a little work will make them almost as nice as new.

Cotton yokes are invaluable for lengthening dresses and underskirts. Cut circular and without fullness at the top. A nice way to lengthen a full skirt is to cut it apart four inches from the bottom and insert a straight or bias strip of some material to match the goods then a yoke, belt and cuffs can be made of the same material.

Vests may be set in waists when these are too small across the bust and back and a waist can be altered in this way for a child and straps placed across the back and front and the sleeves made short, then it can be worn over a separate waist that comes to the waist line.

Some little gingham and percale

When writing advertisers, mention Cultivator

dresses that were still quite good, but outgrown and faded, were first boiled in strong suds to which a little soda was added to remove as much of the remaining color as possible, then they were pieced out to make them large enough and boiled in a strong solution of dark blue diamond dye for cotton and some boys waists were renewed in the same way and they were as serviceable as new garments. Faded muslins will take any of the delicate colors such as pink or any shade of green.

Blouses for the small boys may be let down and the bagging will conceal the piecing.

If the little girl has outgrown her hat you may remove the crown and take out a row of braid to allow it to fit the head. Then make a new crown of silkoline or any soft material and sew it to the brim. A nice Leghorn or any fine straw hat can be made over by making a new crown of chip and net weave and then adding two or three rows of fancy straw braid to the brim and these can be bought for a small sum at any millinery store.—Martha.

BREAD MAKING.

Every woman who has the responsibility of cooking should know how to make good bread. It is the staff of life; it is used at each meal and should be light, sweet and well baked. The requisites for good bread are good flour, fresh sweet yeast, pure water or milk scalded, and a good oven. Milk should never be used in any kind of bread without being scalded or brought to a boiling point before using.

Flour should always be kept in a dry place. Dough should be kept warm and not be exposed to drafts. People often fail in bread making because they use poor yeast. If it is dry or discolored, it is too old; if it is rank smelling, it will spoil the bread. The sponge should always be beaten till stiff. Knead the dough till it has a silky smoothness, is full of blisters and does not stick to the hands. Bread should double its bulk at the first rising in four hours, and at the second in one hour. It should be watched carefully while baking. In ordinary small ranges the loaves need frequent turning to insure even baking.

Bread should be baked 40 to 50 minutes. When it is safe to handle, it is safe to take out. Always take bread from the pans as soon as it is removed from the oven, then cover and allow to cool slowly. After it is cool, cover and keep in a dry place.—Farmer's Tribune.

RANDOM SHOTS.

I shot an arrow into the air, it fell to earth in the distance, I knew not where, till a neighbor said that it killed his calf, and I had to pay him six and a half ($6.50). I bought some poison to slay some rats, and a neighbor swore it killed his cats, and rather than argue over the fence, I paid him four dollars and fifty cents ($4.50). One night I sat sailing a toy balloon, and hoped that it would soar till it reached the moon; but the candle fell out on a neighbor's straw, and he said that I must settle or go to law. And that is the way with random shot—it never hits in the proper spot; and the joke you spring that you think so smart, may leave a wound in some fellow's heart.—Walter Mason.

The grange at Holley, Oregon, will hold its annual picnic May 19th.

Hay.

General reports from all over the state are encouraging. While a good rain, generously distributed, would have given us one of the largest crops we have known of late years, the moisture in the ground and in the atmosphere will be sufficient to give us a plentiful supply, and we anticipate somewhat more than the average, in fact a large supply of hay, and rather impartially distributed throughout the hay-growing sections. While the Southern districts would like more rain, the Bay counties have had just enough.

Regarding future prices, it is extremely difficult to make predictions. We have received during the past week a few cars of the new volunteer crop. It is altogether too early to establish to market value on these arrivals, as such values can only be determined when the hay arrives in large quantities, bringing one section in competition with another. From reports of shipments, we anticipate that the coming week will bring in large quantities of volunteer and early grain hay, mainly from the southern section, which first produces these grades.

Citrus Market

LOS ANGELES, May 12, 1909.

Oranges are going forward at very heavy rate. The output is proving much greater than anticipated earlier in the season. This excess of fruit which has to be handled soon is the cause of the forced shipments. Over 1500 cars of navels yet remain and they will not be cleaned up till well into June. Valencias go forward occasionally, but only when trees are overloaded.

Lemons are not demanded as keenly as in warmer weather. Higher grades command fair prices and lower grades go begging because as a rule they are poorer keepers.

Shipments.

Shipments since November 1, 1908, aggregate 23,784 cars of which 20,820 were oranges and 2,956 lemons.

NEW YORK, May 19.—Sixty-six carloads of oranges and five carloads of lemons sold. Considering size of offering the market held up extremely well, but was naturally somewhat easier and lower. Weather clear and warm. Extra fancy navels ranged from $2.10 to $3.60, average, $2.80; fancy, $1.85 to $3.20, average, $2.55; extra choice, $1.80 to 2.95, average, $2.30; choice, $1.60 to $2.55, average, $2.10.

BOSTON, May 10.—Twenty-seven carloads sold. Weather hot. Market is unchanged.

CONGO

THE ONLY ROOFING GUARANTEED BY A SURETY BOND

IT PROTECTS YOU ABSOLUTELY

A Guarantee Without a Loophole

When we used to say that Congo 3-ply would last ten years people laughed and replied that "Everybody claimed that." When we offered to guarantee such service they said "Guarantees mean nothing—the buyer can never enforce them."

So we went to the National Surety Co. and paid them a large cash premium to issue a Surety Bond with every roll of Congo Roofing.

These bonds give our customers a real, substantial guarantee as good as a government bond.

If the customer's own lawyer drew the guarantee he could not devise an instrument that would give any better protection.

It is because Congo is so tough, perfect and durable that the National Surety Company is willing to stand back of it. They know that we use the best materials and the best methods and that we watch and inspect every roll. Then we wrap it for domestic use just as carefully as if it were destined for Madagascar or Thibet, and you get perfect, undamaged rolls every inch of which you can use.

The man that buys Congo gets the most value for his money and takes no chances.

We will send you a copy of that guarantee on request—also a sample of Congo Roofing free.

Control of Weeds by Chemical Sprays

Mustard Easily Controlled but Wild Radish Much More Difficult. A 20 Per Cent Solution of Sulphate of Iron Does the Work

Wild Mustard — Wild Radish

THE control of weeds by spraying with a chemical mixture looks attractive. Unfortunately all weeds are not subject to control in that way. However, those which are may be handled most economically. Some weeds which are pests in grain or hay fields when cultivation is not possible, are in this class. The illustration above pictures two pests controlled by the sulphate of iron solution. This is not injurious to the grain, but does control the pest.

The solution must be applied with a powerful spraying machine, producing a real mist free from drops. The best pressure is 80-100 lbs. measured at the nozzle, not at the pump.

A properly constructed machine will deliver continuously the mist at 80 lbs. pressure, and at 100 lbs. the mist is driven onto the plants and ground and rolls over and over, wetting the underside of the leaves as well.

Depending on the facilities for preparing and handling the solution, a two-horse spraying machine will spray from twenty to one hundred acres of grain in a ten-hour day.

The success or failure in spraying grain crops to kill weeds depends on how the sulphate of iron is applied, and when. For instance, if the solution is applied in drops, as from a watering pot,

(Continued on Page 591.)

Disks 50 Times More Work

Washing 42 disks, and other bowl parts, from a disk filled "bucket bowl" machine. Other "bucket bowls" are about as bad.

Are you willing to wash and dry 50 to 100 times more tinware surface than you need to? If not, why not let "bucket bowl" cream separators alone and get a Sharples Tubular? Is thoroughly washing and carefully drying tinware so easy that you don't care how much you wash? Had you not rather wash a single piece, that has no more surface than the palm of a man's hand, than to wash 40 to 60 pieces that, together, have as much surface as a piece of carpet two yards long and a yard wide? That's a pretty big contrast for sure.

The disks in the full pan belong inside a "bucket bowl." The little piece in the other pan is all there is inside Sharples Dairy Tubular bowls.

But it shows truly the difference in the work of washing a common disk filled "bucket bowl" cream separator as compared to washing the light, sanitary, wear forever modern bowl used in Sharples Dairy Tubular Cream Separators. Look at the two dish pans and you'll see the point. Other "bucket bowl" separators are about as bad.

Considering the complication and weight of "bucket bowl" cream separators (and **all** cream separators **except the Tubular** are the "bucket bowl" kind) don't you think you'll save a lot of work, wear and expense by letting the "bucket bowl" sort entirely alone and getting a Tubular?

All there is to the Dairy Tubular bowl. Washed easily in three minutes. A few thrusts with the brush does it.

It is not surprising that Tubular sales exceed those of most, if not all, other separators combined. "Bucket bowl" sales have been so reduced, by Tubular popularity, that the leading maker of disk machines (the self-styled "original" disk maker) has found it necessary to commence suits against a catalog house and others that have been making and selling cheap separators with disks like his for a number of years. Why? Because he has lost his grip—taken a back seat—is so out of date that he's scrapping for trade with the catalog house and other cheap concerns.

The Tubular is made in the world's greatest cream separator factory. Branch factories in Canada and Germany. It is the world's greatest cream separator. It will give you greatest satisfaction—greatest profits—greatest wear. Get Catalog No. 260.

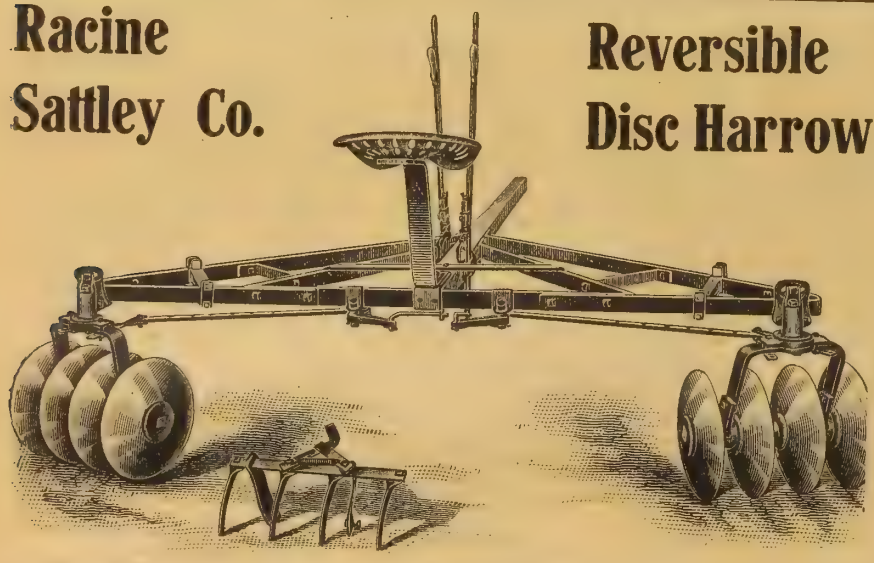
Racine Sattley Co. Reversible Disc Harrow



We sell this disc harrow under a very strong guarantee. That it will do as good or better work than any other implement of the kind on the market, or your money back.

Especially adapted to Orchard and Vineyard Use

Three distinct adjustments. Can reverse the gangs to throw the dirt in or out—can tilt the outer or inner end of gangs, as desired, for work on side hills and ridges—can set the gangs at any angle desired with the two levers.

MADE IN SEVERAL SIZES

Of what good is a disc harrow unless it will penetrate? We spend thousands of dollars in grinding and polishing our harrow discs, and in putting them through several operations of special preparation, which do not enter into the preparing of the discs for other makes of disc harrows. That's why the "Racine-Sattley" harrows are held as the standard of quality by all ranchers today.

Furnished with Extension Frame, as above, or without it.

8-18 in. disc, 4 ft. cut, complete with scrapers, pole, double trees and neck-yoke,	$33
10-18 in. disc, 5 ft. cut, " " " " " " " "	$36
10-20 in. disc, 5 ft. cut, " " " " " " " "	$37
Extension Frame, Complete, extra	$5

WE PAY THE FREIGHT

For a limited time, we will pay the freight charges to all points within 125 miles of Los Angeles, on these harrows, at the above net cash prices.

HAY PRESSES

Fourteen years ago we began selling the **Eagle Hay Press.** During this time we have sold over 600 of these presses, and as near as we can learn there is not a second hand Eagle Press for sale today. This, we believe, is the best hay press record of any make sold on the coast. The press, as made today, is, without a doubt, the strongest, best and longest lived press on the market. The question is: Will it pay you to experiment when you know that you can get a tried, and not found wanting, press.

A word in favor of the **Columbia Ann Arbor belt power hay press:** Three years ago we started to sell these power presses. We now have in the field, and orders written up which will go into the field within the next ten days, 34 of these presses. Last year one of our 17 x 22 steel frame power presses bailed 3800 tons of hay, and averaged a little over 53 tons per day. This is a record that we can assure you no other press has ever made in this territory, or anything near it. If you are a friend to yourself you will thoroughly investigate the power hay presses before placing your order for a press with anyone. We court the closest investigation, as we have the conclusive evidence that we have what you are seeking. You will find us at 110-112 North Los Angeles St.

National Irrigation Congress at Spokane

An Appeal for Proper Consideration and Greater Interest in the Convention to be Held in August

Written by HARVEY W. SCOTT, of Portland, Oregon

NOWHERE in the world is agriculture so intelligent as in the irrigated regions; nowhere is it so productive, and nowhere else have the problems of poverty, isolation and failure been so effectually attacked."

Colonel Harvey W. Scott, editor of The Portland Oregonian and dean of journalism on the Pacific slope, who has been actively identified with practically every uplift movement in the Northwest during the last 35 years, says this in urging continent-wide co-operation and commenting upon the importance to the nation of the National Irrigation Congress, which will have its seventeenth session in Spokane August 9 to 14, under the presidency of George E. Barstow of Barstow, Texas, adding:

"If the people were interested in events in proportion to their importance the irrigation congress next August would plunge the whole country into wild excitement. One imagines, however, that our national equanimity will not be greatly perturbed by it.

"Although the subject to be discussed relates vitally to human happiness, although the way we finally answer the question which the eminent speakers at the congress will raise may decide whether 500 years from now the United States shall be a flourishing empire or a desert solitude, nevertheless it will not be easy to arouse more than a perfunctory public interest.

"The great names of the orators, the pomp of civic festivity, the display of governmental science will all be needed to hold the languid ear of the indifferent farmer, whom nothing short of an earthquake will compel to think or study. Irrigation would rain gold into his tubs if he would set them out, but he won't until he is harried and hounded into doing it.

"But the farmer is no worse than other men. Few of us take more than a feeble and spasmodic interest in the things that concern us most deeply. Consider how speedily an audience vanishes whenever a speaker touches on education, a subject whose import is even weightier than irrigation.

"If man were a truly rational being the minute he learned that irrigation would double the produce of his farm, even in such a favored region as the Willamette valley, he would rush to build dams and dig ditches, but he doesn't. He waits until somebody has pushed and prodded him.

"Think how long it has taken some of the rural brethren to begin spraying their apple trees. They know that a few doses of lead arsenate would save their fruit from ruin and line their pockets with dollars, but not a drop did they spray until a paternal government stepped in and gave them no choice. As a race we are just as lazy and shortsighted as we dare be, and most of us would far prefer to swing a heavy sledge hammer 10 hours rather than think for 10 minutes.

"Such congresses as the one which will meet in Spokane next August are more valuable for reiterating old truths than for revealing new ones. Iteration is all that saves the world from a relapse into barbaric squalor. Hearing the truth about irrigation or anything else once only does us not the slightest good. We must hear it a thousand times and in every possible key.

"The Massachusetts savings bank insurance scheme was based on the supposition that when life insurance was made cheap and easy every person who needed it would step up and buy it. No madder dream was ever dreamed. The project has been open many months, but only two banks are offering insurance, and there is nobody to buy. To persuade us to insure our lives and save our wives and children from destitution we need a brazen-tongued agent to ring an alarm in our ears.

"Mankind is like the starving pauper who was on his way to the graveyard to be buried alive for his indolence. The merciful judge offered to suspend sentence if anybody would feed the condemned. A kindly farmer offered a meal of corn. 'Is is shelled?' inquired the pauper, with languid interest. No it was not. 'Drive on then,' said the pauper. We need such gatherings as the national irrigation congress to shell our corn for us.

"Civilization originated in countries where men were forced to irrigate the land or perish. In Babylonia and Egypt were laid the foundations of every science and all the arts. The reason is plain enough. Irrigation drives man to think and plan on the one hand and to co-operate with his neighbors on the other. The habit of thinking about one subject leads him to exercise his brain on others, and presently he discovers the great truth that ideas are upon the whole beneficial to him rather than baneful.

"Co-operation is the only way out of most rural difficulties, and it is easier in irrigated regions than elsewhere for divers reasons. One is that irrigation depends from the beginning on co-operation. But also the farms are necessarily small, people live near together, contiguity develops confidence, the plane of public intelligence rises, the communal consciousnss sets to work and presently the whole neighborhood studies, buys, sells and thrives as one man."

R. Insinger, chairman of the local board of control of the National Irrigation Congress, says that while the four primary objects are to save the forests, store the floods, reclaim the deserts and make homes on the land, other matters of importance to farmers, orchardists and fruit growers in general will be discussed by the foremost men in the country, announcing also that considerable time will be given to discussing problems in connection with the reclamation of swamp lands, good roads, deep waterways and better husbandry.

Results of Irrigation on "Barren" Land of Arizona.

Wedged Heads

A Keen Kutter Hammer can *never* fly off the handle.

It is secured by the wonderful Grellner Everlasting Lock Wedge which expands the wood in the head and when driven home is forever locked in place.

This wedge is the only perfect and lasting device of its kind and is found only in

KEEN KUTTER

Quality Tools

All Keen Kutter hammers, axes and hatchets are secured in this manner.

The Keen Kutter name and trade mark cover tools of all kinds for home, shop, farm or garden, also a full line of pocket-knives, scissors and shears and cutlery.

The only tools with all risk removed. Each Keen Kutter tool is guaranteed to be perfect or your money will be returned. If not at your dealer's, write us.

With the Citrus Growers

THE FLORIDA GROWERS.

FOR two weeks California orchardists entertained about forty-five growers who came to this state from Florida to learn as to marketing methods. Often it was spoken of as a trip to gain information as to growing of oranges, but we note our Florida friends were somewhat sensitive on that point, at least a recent issue of the Florida and Produce News states that the only reason for the delegation going to California was to gather information as to the packing and marketing problems.

In any case Florida growers came and have been received, so far as we have heard, with greatest cordiality and shown everything in sight which California orchardists had to show. This committee has now returned home and are perhaps engaged in formulating reports which will be made to the convention which will be held in Tampa, June 1st. At that convention a large attendance from all sections of Florida is expected. It is hoped a co-operative marketing organization will be perfected at that time which will lead to more profitable handling of Florida citrus fruits.

The party which visited California consisted of Mr. and Mrs. L. B. Skinner, Dunedin, Fla.; Mr. J. W. Sample, Bartow, Fla.; Mr. and Mrs. W. B. Gray, Carney Fruit Co., Tampa, Fla.; Mr. and Mrs. E. Holtsinger, Swan & Holtsinger Investment Co., Tampa, Fla.; Mr. and Mrs. L. W. Tilden, Tavares and Gulf R. R., Oakland, Fla.; Dr. and Mrs. F. W. Inman, Florence Villa, Fla.; Mr. H. A. Ward, Winter Park, Fla.; Mr. W. S. Hart, Hawks Park, Fla.; Mr. and Mrs. J. J. Heartt, Arcadia, Fla.; Mr .and Mrs. David Scott, Arcadia, Fla.; Thomas B. Quinby, Jacksonville, Fla.; Mr. M. Carney, Summerfield, Fla.; Dr. O. W. Sadler, Tangerine, Fla.; Mr. A. C. Clewis, Tampa, Fla.; Dr. and Mrs. M. O. Terry, Fort Myers, Fla.; Mr. Charles H. Walker, Florence Villa, Fla.; Mr. and Mrs. H. E. Heitman, Fort Myers, Fla.; Mr. G. M. Wakelin, Lake Harris, Fla.; Miss Bell Inman, Winter Haven, Fla.; Hon. and Mrs. Thomas Palmer, Tampa, Fla.; Mr and Mrs A. G. Smith, Wauchula, Fla.; Mrs. F. H. Abbott, Fort Myers, Fla.; Mr. F. A. Lane, Fort Meyers, Fla.; Mr. and Mrs. Joseph Bumby, Orlando, Fla.; Mr. and Mrs. W. D. Taylor, Ocala, Fla.; Mr. C. H. Thompson, Winter Haven, Fla.; Mr. H. Guy Nickerson, Florence Villa, Fla.; Hon. and Mrs. W. W. Clark, Bartow, Fla.; Mr. Arthur R. Rule, Jacksonville, Fla.

Nearly all sections of Southern California were visited and especial attention was given to packinghouse equipment. G. Harold Powell of the Department of Agriculture and Mr. Burton of the Fruit Growers Exchange acted as guides and gave all possible information to the visitors. Packing houses were wide open to inspection and all members made free use of the courtesies extended.

In order to make the investigation as profitable as possible Dr. F. W. Inman, who was really the chairman of the committee separated the work into departments and appointed committees to investigate as to each line of work. For instance, there was a committee on finance, on legislation, on picking, packing, grading, transportation, machinery appliances, precooling, advertising, selling and distribution, fertilization, irrigation and diseases and pests

At some of the points meetings were held and addresses were made upon methods of packing, marketing and other matters of interest.

Conversation with Florida men showed plainly that they were a bunch of representative men of which any state might feel proud, and they were quick to express appreciation for the reception given to them in this state.

FLORIDA CONDITIONS.

From an interview in the Riverside Press with one of the Florida Committee we quote:

"There are three kinds of soil in Florida, hammock, clay and pine barrens. There is but little irrigation necessary, but wells are sunk in many orchards and pumping plants established. Water is found within 15 to 100 feet from the surface. Often irrigation is necessary only once or twice a year. The irrigation is usually in April or May.

"Practically all groves are adjacent to streams, rivers or lakes, and while we have some good shell roads in Florida, motorboats are used as freely as automobiles in Southern California. This makes two handlings of the fruit necessary, but even then it is not expensive.

"There has been started in Lee county the first big central packing house built in Florida. This will pack from groves from an area of 35 miles around, the fruit all being delivered at the house by water. The house is built on piles in the river with railroad tracks laid close to it. A precooling plant is being erected with the packing house.

"California has it over us in the marketing matter. Every grower now packs and markets his own fruit, but we plan an organization on the lines of the exchange, and hope that this will help us out of some of our difficulties.

"The base of Florida's orange industry has gone south 100 miles since the big freeze in 1895. California has another advantage over us because of organization. When we have a freeze everybody knows about it who reads the papers. When there is a cold snap in California the fact is carefully concealed and is only learned through private sources.

"The equipment in Florida and California houses does not differ much, the sizes being much smaller with us. At Sanford is a brick packinghouse entirely equipped by the California made appliances.

"We have some diseases and scale pests that California does not have to contend with. The witherleaf is one of these, causing the tender shoots to wither and the fruit to look as if tobacco juice had been squirted over it. It is a fungoid growth. Then a surface bark disease, is another trouble we have that I understand has never found its way to California. We do little spraying and no fumigation for scale pests, relying on the native parasites of the scale to keep them down. The white fly is the worst pest we have, and California is fortunate indeed in having so successfully ridden itself of the fly last year. The umbrella tree is a bad host plant

and should it again appear in California these trees should be carefully watched. Defoliation will not accomplish its purpose in destroying the fly unless the foliage is carefully burned. At Deland, Florida, live flies were found on leaves that had been several weeks from the trees."

TEXAS ORANGES.

It appears that upwards of 1,000,000 orange trees have been planted in Texas, which would occupy 10,000 acres at the usual rate of 100 trees to the acre. Most of these are said to be of the Satsuma variety, which has but very slight demand in the American market. This fruit is grown to some small extent in California, but scarcely, if ever, is shipped in carload lots. It is an early orange, ripening in Texas, it is said, in October and November. It is a small, flat fruit of Japanese origin, and of the Tangerine type, which is perhaps better known to California readers.

From all the information published regarding the planting of orange orchards in Texas it would seem that the investors are likely to suffer great disappointment when most of the trees come into bearing, for there is no probability that the market demand will ever equal the supply. The Satsuma is decidedly inferior to the navel or any other standard variety of the orange grown in California.

The Texas boom in orange planting seems to have been started and kept up by real estate agents with lands to sell. Although some astonishing figures have been given out as to the returns from certain orchards of Satsuma oranges in the Lone Star State, running up to $1,000 per acre, according to report, such statements must be taken with a great deal of allowance. Even if correct, they afford no basis for a reasonable estimate of what may be expected when a large acreage of the fruit comes into bearing. They probably apply only to orchards of an acre or two, and the sale of Satsumas in small lots affords no assurance of a market for hundreds of carloads.—Sacramento Bee.

Palo Verde Valley is to have a government town site platted.

CENTRAL CALIFORNIA CITRUS SHIPMENTS.

The growth of the citrus fruit industry in California for the past fifteen years has been of phenomenal importance to growers of this fruit all over the state.

In Southern California the total output during the season 1893-4 was 5,871 carloads, which was increased to a grand total of 29,497 carloads for the season of 1907-8.

Figures for this industry north of the Tehachapi are available only for the past seven years with only incomplete figures for the present.

The following table shows railroad figures for total shipments by carloads and total boxes shipped from points north of the Tehachapi.

Year	Total cars	Total Boxes
1902-3	1304	500,736
1903-4	1567	640,128
1904-5	1734	665,856
1905-6	1564	600,576
1906-7	2333	895,782
1907-8	3150	1,209,600
1908-9	1949	748,461

(1908-9 crop figures do not include the crop of Valencias which are yet to be shipped, and which are estimated at about 200 carloads.—Porterville Messenger.

GROUND SQUIRRELS.

The ground squirrel question is being handled in some sections and the Cultivator is receiving some suggestions. We give below hints from practical workers:

From San Jacinto.

I hope the new squirrel law will be enforced. Squirrels are not a quarter as hard to kill as gophers, their holes are always wide open, and they will eat most anything.

I have killed them in several ways, but I prefer the following. Rolled barley 2 parts, flour 1 part, powdered strychnine, mix thoroughly, wet with molasses and warm water, a few drops of oil of anise or bergamot is a help. A dessert spoonful in every hole you can find, for there may be several squirrels in one nest, and there are always other nests near, and they visit each other, and will get all the poison.

If you go around the next day and partly fill the holes, then go again the next day you can see if you have killed them, but unless all the squirrels in a mile are killed at once the holes are liable to be occupied again in a few days.

If people had any idea how many eggs squirrels carry off, and eat in the hens nests, the women and boys would be after them more.—N. D. McNeil., San Jacinto.

Hughson Stanislaus County.

I have killed scores of squirrels this spring. My remedies are the shot gun and steel rat trap. Have gun handy while working in the field so as to get them while off their guard. I shot several while working with the team by carrying the gun. When an opportunity presented itself I get the squirrel. In that way it is possible to get within close range.

The advantages of the steel trap are that it waits for the squirrel, besides it can be used indefinitely, Squirrels are sometimes shy of traps for a few days, but later become bold and get caught. By keeping traps persistently set in the entrances of the holes, I average 1 to 2 a week per trap.—James C. Fritts, Hughson, Stanislaus County.

DOUBLE SATISFACTION.

Nothing is more satisfactory than to be able to secure honest goods at fair prices. Nothing is more satisfactory than to deal with a merchant whose guarantee on some particular line of goods is an obsolute protection because the manufacturer of the goods stands back of the merchant. This is the case in dealing with those merchants who handle Rex Flintkote Roofing.

This roofing has been on the market for many years, and it is worthy of note that the merchants who handle it and whose endorsements have appeared in these columns are all enthusiastic believers in the quality of Rex Flintkote Roofing and in the fairness of J. A. & W. Bird Co., the manufacturers of this celebrated prepared roofing. We advise you to ask your dealer about Rex Flintkote when you need roofing. He may tell you there are cheaper roofings; but he cannot say there are better or more durable ones.

We advise our readers to send for "Rex Flintkote" booklets to J. A. & W. Bird & Co., 00 India St., Boston, Mass., and not how this firm does business.

All About the Orange and Lemon

Is told in our new book on Citrus Culture, embracing every phase of the subject from the seedling plant to the final disposition of the fruit in the Eastern market. The largest and best book on the subject ever printed —60,000 words, 100 illustrations. You will want a copy, which we will send you for the small sum of 25 cents. Remember we are the largest growers of orange and lemon trees in the world.

Deciduous Fruit Culture

By J. W. Mills

THINNING FRUIT.

IN fancy fruit-growing, the necessity for thinning will become more and more apparent as the acreage devoted to orchards increases and competition becomes more keen. While the wisdom of thinning peaches is no longer doubted, the growers are not so willing to take up systematic work in thinning apples and pears. But the time is coming when the fruit-grower will be forced to conclude that it no longer pays to grow poor fruit. Even now, the years that the grower makes a profit in shipping choice fruit, are the exception rather than the rule. There are but few localities where choice fruit cannot be grown, and wherever shipped, such fruit must generally compete with the home-grown product. On the other hand, localities where strictly fancy fruit can be grown are limited, and competition in this class is more impartial. The competition is between localities which are probably equally distant from the market, and the one producing the best fruit is the successful competitor.

To a certain extent, pruning is a method of thinning, but it will not take the place of hand-thinning entirely. The production of a fancier grade of fruit is not the only benefit derived from thinning; it encourages more regular bearing; lessens the loss from the breaking of limbs and gives the grower a chance to destroy insect infected fruit and thus check the spread of insects early in the season. The tree that has been properly thinned should produce a good crop of fruit buds each year, and if it has been properly trained and thinned it will never need a prop. While many have observed that apple and pear trees are inclined to bear alternate years, probably few understand the cause. Fruit spurs with terminal fruit buds, as those of the apple and the pear, generally bear only alternate years, and if the spurs are all full of fruit one year, the next must be an "off-year," as we say. Not only do the spurs fail to bear annually, but if the tree is overloaded, spurs that produce bloom, even though they fail to set fruit, may not be sufficiently nourished to produce fruit buds for the following season. If the tree bears only a moderate crop of fruit, spurs that produce bloom but no fruit, often develop fruit buds the same season. Where the tree is bearing a light load, spurs may mature fruit and develop fruit buds the same season. Varieties differ and, while some are regular bearers under almost any treatment, others show a stubborn inclination to bear alternate years. After the old tree has fallen into the habit of bearing alternate years it is no doubt harder to get it back to a regular bearing habit. "Off-years" are not uncommon with some of the fruit trees bearing from axillary fruit buds, but it is not so pronounced as with the apple and pear.

Thinning the Apple.

Fixed rules to be followed in thinning are hard to give. Much depends upon the general thrift of the trees, and, as in pruning, the grower will have to learn much by experience. If we thin to encourage annual bearing, it will be seen that all the fruit must be removed from some of the spurs and, at the same time, the number of fruits remaining must be reduced to such an extent that the tree is no overburdened. Some thin to leav the fruits so far apart, but a rule fix ing a certain space between apple will not hold good in all cases. If w were always sure the tree had bee properly pruned, we might be able t give a satisfactory rule to be follow ed, leaving the fruits so many inche apart. A plan the writer has trie and found very satisfactory is to s thin as to have a certain number o boxes of fruit on the tree. Suppos you decide that the trees should pro duce ten boxes of fancy fruit each. A fairly uniform grade of apples ranging from two and one-half to three inches in diameter will pack about 150 to the box, and by thinning two or three trees and leaving the 1,500 apples, actually counting them or estimating them as closely as possible, one learns what a tree properly thinned should look like. With these trees as a model it is surprising how close one can come to leaving just the right number. I think it is possible, by careful work, to come within a box of the ideal. But knowing how much the tree should produce is where the experience counts. Not many varieties of apples will require much thinning before they are ten years old, and at this age the average tree should produce about eight boxes of fancy fruit; some will produce more and some less. After the tenth year a gain of a box per year would be a conservative estimate. Of course, the yield will vary under different conditions; and, while this is not a rule that can be implicitly followed, it is surely more accurate than thinning to a certain distance. The thinner first removes defective or wormy specimens, and he should be supplied with a bag to carry the wormy ones from the orchard to be destroyed; then those from the tips of the limbs may as well be removed for they seldom make fancy fruit; and, if possible to do it and leave the required amount, thin to one fruit on the spur. June and early July is the proper season for thinning apples and pears. Experiments have shown that it pays to thin apples. The fruit is improved in both size and color; the trees bear more regularly, and trees that may break under heavy loads are saved. Some say it is expensive to thin; but, if one stops to think, it really costs no more to pick fruit in June than it does in October. A man can thin from ten to fifteen twelve-year-old trees per day, and the actual cost of thinning should not add to exceed two cents per box to the cost of production. It is true that the results the first season are often disappointing, for an unthinned tree may produce sixteen boxes of fruit that will grade 50 per cent fancy, while the thinned tree of the same age only produces ten boxes that will grade 95 per cent. fancy. It hardly seems profitable, but the next year will tell, and it is safe to say that two years running the thinned tree will produce as much fancy as the unthinned tree will produce of both fancy and choice.

Thinning Pears.

Methods of thinning pears differ little from methods of thinning apples; the principles are the same. As a rule the pear tree will produce about as many boxes of pears as will the apple tree of the same age produce boxes.

Small Fruits and Vegetables

BACTERIOSIS OF BEANS.

FREQUENTLY the foliage, stems and pods of the common and Lima bean, are preyed upon by a bacterial disease, Pseudomnas phaseoli (Smith), known as Bacteriosis. The symptoms are such as to make it readily distinguishable from all other maladies to which the bean is heir.

There appear on the different parts of the plant, especially on the leaves, large, watery, brown patches or blisters that soon dry up and cause the tissue to become brittle and to curl, leaving the foliage ragged and good for nothing. The pods seem to furnish the best food supply for the microbes and it is here that we find the disease at its best. Small discolored spots appear at first, which spread very rapidly and produce large lesions with pink or reddish brown borders, and which have pale yellow or amber colored crusts over the affected areas. This crust is due to the accumulation of myriads of amber colored bacteria which have formed a layer over the broken down tissue. After a time the pod rots and the beans are worthless.

Warm, wet weather seems to favor the disease, for the germs grow best under these conditions, and the beans at this time produce succulent growths, which are more readily attacked. Rain and dew are doubtless agents in spreading the germs from one part of the plant to another by washing them from old lesions onto unaffected parts. Insects play an important part in disseminating the trouble, consequently any measures which tend to check these pests will aid in controlling bacteriosis. The distribution of the disease is further effected by dead vines and leaves carried on the wind; by the soil, and through the seed. New land which has never grown beans seems to be freer from the disease than old, and should always be used when available.

The seed used in planting should be selected by hand and all the lighter ones discarded, since experiments show that diseased seeds are less dense than sound ones. As yet no satisfactory method has been found which can be recommended for treating the seed to destroy the causal microbe which does not lower the viability of the seed.

Inasmuch as the germs of bacteriosis work on the outside of the plant, it is possible to reach them with a fungicide and spraying with Bordeaux mixture upon two and three-inch plants, followed by the same ten days later and again after blossoming. Dr. Halstead uses a Bordeaux mixture of the following strength: Copper sulphate, 6 pounds; lime, 4 pounds; water, 60 gallons.

Variety tests conducted by the New Jersey Experiment Station during the three years 1897-1899 with Green Flageolet, Currie's Rust-proof, Early Mohawk, Golden Wax, Extra Early Refugee and Saddleback Wax, showed the Green Flageolet the most susceptible, and the Early refugee the least.—Walter G. Sackett, Colorado Agricultural College.

RED RASPBERRIES.

A most delicious table fruit for sauce and "short cake"—and what farmer does not like "short cake"—is the red raspberry, just as good as the strawberry, says the "Farmer and Stock Grower," The same rule for growing the reds, so far as location, soil and the preparation, applies here equally with the rule for blacks, or with any crop. It is, however, found that the reds will do fairly well on a sandy loam with clay subsoil. So, if your raspberry lot is sandy, try the reds. With us, the Cuthberts are the favorites for all purposes possible—a good firm berry.

The group includes varieties which bear fruit of various shades of red, amber, yellow and purple. It is known to botanists as Rubus Strigosus. The fruit is generally red. It is a type more hardy than the Black Cap, the canes are upright, and the bark is of a light brown color. The method of propagation is different than with the blacks. The method is from root sprouts, grown one year and transplanted the next. Young succulent sprouts containing a portion of the mother root grow rapidly, but the safest way is to use the year-old plants. Of course, if you are a new beginner, you must get plants from a nursery or a grower. Be sure and get good plants with fine fibre roots. Don't let any one sell you poor plants if you wish to succeed.

The distance for planting depends very largely upon the purpose for which the plantation is intended. Three by three feet and three by four feet will give you room to cultivate. If you are only to garden it, it sometimes becomes desirable to combine in the same plantation other small fruits. This plan is not objectionable to the one who has little room or a small family to supply. Under these conditions plant distances may be lessened. Raspberries may be used very nicely as fillers between rows of peach, plum, pear or apple trees. If it is intensive farming you are practicing, try this plan. Much pains must be taken in handling the plants for selling. They are tender and easily injured. Lay them in a furrow made by a spade, the roots spread against the land side, as it were, firm the earth back carefully and they will come up straight. No need of any more care—only good cultivation.

The reds require pruning at two seasons—summer, during growing season, and winter or late fall—for the purpose of eliminating the canes which bore fruit. The summer pruning is to stop the young shoot at a growth of eighteen inches, inducing them to throw out side shoots.

But I may weary you with too many rules. Use your own good judgment in many things, but once again, grow some red raspberries.

CONTROL OF WEEDS BY SPRAYS.

Continued from Cover.)

the weeds will shed the drops without any damage being effected. Large drops strike the leaf and roll off; small drops run together and form large drops, but a mist from a good sprayer settles down upon and completely covers the leaves.

Spray on a bright, warm day, or on a dark, damp day; it does not matter so long as rain does not come within 18 or 20 hours. Spraying on dark, damp days gives quickest and surest results. Spraying on bright, warm days must be followed by dew the next morning to be effective.

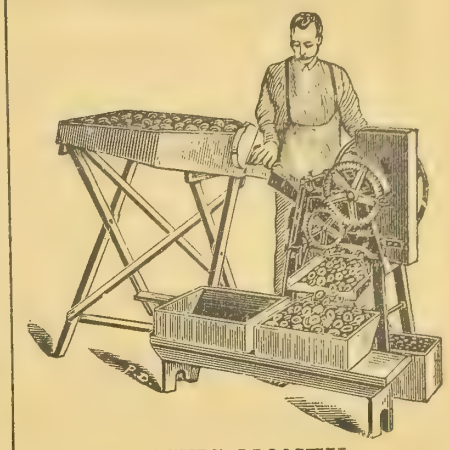
The white coating, or spots, seen on leaves sprayed dry, warm days, is the dried out sulphate of iron; the dew dissolves this so it acts on the leaves.

It was formerly thought that the best time to spray was when the mustard plants were in the third or fourth leaf; now we know the best time is when the first buds appear on the majority of the plants, for then only is practically all the mustard seed in the soil germinated. To do the best work, apply 52 gallons to the acre.

To make the spraying solution, empty a hundred pound sack of the sulphate of iron into a kerosene, whiskey, or vinegar barrel, fill to the chine with water and stir with a hoe for a few minutes until dissolved. Strain through several thicknesses of cheese cloth tacked over manhole of the spraying machine.

The "Briggs" Improved

FRUIT PITTING MACHINE



SAVES MONEY
FRUIT AND
ANXIETY

By helping you to keep up with your crop. The fruit is cut smoothly, entirely around, and not bruised; and the dried product sells equally as well as hand cut. It does the work of eighteen or twenty hand cutters, doing good work on

Free Stone Peaches
Apricots and Plums

It is no experiment and is guaranteed.

Scalefoe

Greatest Known Spray or Wash for Scale: San Jose, Black, Red, Purple and Brown. Also a sure thing for Red Spider, Canker Worm, Moss, Caterpillars, Lice, Codling Moth, and all Insects and Bugs that infest plant life; without injury to the plants, and with positive benefit to the soil, when applied. Also kills Lice and Mites on Poultry.

This has long been the leading Spray or Wash in many sections of the country, wherever introduced. We have bought the formula and the rights for this section and are putting it out under our own brand. No article can bear the "West Coast" name unless it is the best of its kind. We guarantee Scalefoe to be just as represented.

Gallon can, 85 cents; 5 gallon can, $3.75. Price f. o. b., Los Angeles, but if not sold by your dealer will send gallon can for $1 or 5 gallon can for $4, freight prepaid by us within 200 miles. Write for price in barrels. Mix 20 parts water to 1 part Scalefoe, before using; makes it the cheapest as well as the best. Satisfaction or money back.

Made by the

West Coast Mill
Los Angeles, California

FOR SALE

I have 20,000 Eucalyptus Rostrata left, running from 6 to 14 in. $5 a thousand.

Covina Floral Nurseries
Box 545, Covina, Cal.

Owners of live stock in California should insure in their own association, the

California Mutual Live Stock Insurance Association

$2,166,425.00 of insurance written in the last year.

It is the only institution of the kind organized under the laws of California with the home office in this State.

We insure live stock against death from disease, fire, lightning, tornado, cyclones and every casualty; also through accident which may necessitate the death of any animal.

Losses are paid promptly without discount and without unnecessary delay.

We have a guaranty deposit under the control of the State Treasurer for the protection of our members and policy holders.

There is $100 of values lost to farmers by death of stock, by disease and accident, where $1 is lost by fire.

We have no dividends or profits paid to idle office holders.

The business of the Association is conducted as economically as is consistent with good management, and the earnings are divided among the policy holders.

This is an age of Mutual Insurance, and it is true the cheapest and strongest companies in the United States today are composed of and managed by the policy holders, who are farmers and stockmen, as has been demonstrated in the East.

The directors and officers are elected annually by the policy holders.

WHY PAY LARGE PREMIUMS FOR PROFIT TO EASTERN COMPANIES WHEN YOU CAN CO-OPERATE WITH YOUR FELLOW FARMER AND STOCKMAN AND SECURE YOUR INSURANCE AT COST?

Live Stock and Dairy

By Mrs. Minna E. Sherman

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

OUTSIDE.

SPRING with its bright flowers and abundant green grass is here. The hay is cut and the teams at work hauling it in to the barns. One field has on half of the thirty acres, five tons to the acre of barley. While the second half borders on the line of a neighbors, who is the man that will not annoy the squirrels by smoke or poison. This year after the barley was too high to see the little rascals they moved in and went to housekeeping and reduced the hay on a part of this land to about two tons to the acre. The value of little things on a ranch makes large holding less profitable than the smaller place where every corner can be watched and cared for in due season. The Bible tells of the mischievous "little foxes." In the human family they certainly mar a person's usefulness by some trifling manner or little habit that could easily be corrected. Squirrels have marred the barley hay this year, and only a few to work the damage. This week will end their life history for George is unhappy to think he did not find them when out last time with the smoker.

Calves.

In the Spring comes to many a man and woman a mania for making garden or for keeping a cow. Nature's striving to waken a sleeping world stirs in them new life. It is good for people to wake up if they will stay awake and not when the midsummer madness strikes them fly off to some new toy. Steady, steady, steady! Is a good word to apply to all our pursuits for it is only old Steady not Fliberty gibbets that wins out in the end. The Spring time brings a crop of calves in time to fight flies and be generally miserable. The happy time for a calf to be born is in the fall or early winter for then much of the troubles of his little life will be held in check by the cooler weather. All the little bugs, lice, flies and mosquitoes are not lying in wait to suck his innocent blood. A poor little thin calf tied to a stake by the road side is a common sight at this time of the year. These calves are too young to eat grass and are cheated out of their natural food by the family—that takes the milk. It is better to treat these calves as the city milk men do, that is end their innocent lives rather than give them no care. While calves can be successfully raised with little or no milk it requires care and someone to make a business of feeding them. When a calf is hand raised it usually falls on a woman to do it, often one already overburdened with work.

Stables.

The calves should have in the summer time a good shed well opened to the air and screened to keep out the flies, the floor tamped with oiled clay and several inches of clean sand on top to catch moisture. The sand becomes valuable as a fertilizer. The sides and ceiling are whitewashed and sprayed often with a cheap coal oil derivative. While carbolic acid is good to add to the whitewash it is not as good a destroyer of many of the bacteria as creolin and others of the petroleum by-products often cheap and prepared for the stock man. A barrel of one of these should be purchased for daily use for one never knows when it will be needed. Stables cannot be fumigated with any degree of success as the sides are not close enough to hold gas. Spraying is, therefore, the only perfect way to disinfect them completely and cheaply

Scours.

When scours attack the calves it must be promptly stamped out by disinfecting the buildings and surroundings. The land can be purified by the sun and wind, plow it up and sow crops that entail close cultivation and working of the soil by turning it over and over during the season. After a case of scours, no matter how well the calves recover they will never be safe until this is done. The germs will be in waiting for a favorable opportunity to develop, whenever they find a subject that is not immune. How shall the calves then best be made immune? By making their conditions healthy. The milk must be fed warm and clean. The pails must be kept perfectly sweet by giving them the same treatment that the cream cans and separator receives, washing and steaming them until their condition is one of perfect cleanliness. These cow babies need to be tenderly looked after if they are to remain healthy and to develop into vigorous cows.

Treatment of Scours.

Prof. Humphrey of the University of Wisconsin treats scours successfully by giving to the sick calf four tablespoons of castor oil in half a pint of warm milk. In four to six hours give one teaspoonful of a mixture of one part salol to two parts of sub-nitrate of bismuth. This is mixed in half a pint of warm milk, or it is placed as a dry powder on the back part of the calf's tongue and washed down with the milk. On the ranch olive oil is often used; half a pint mixed into an emulsion with two eggs. In two hours follow with half a pint of new milk with two eggs, yolk and white beaten up in it. Repeat either or both as often as necessary, to correct straining. If the calf is simply weak, new milk well warmed with a rennet tablet added is given. One rennet tablet or junket tablet is dissolved in a little warm water and added to the milk just before giving it to the calf. Junket or rennet tablets are sold by the grocers at ten cents a bottle. The scours rise from disordered stomach and constipation, watch them carefully and give them oil if needed without waiting for other troubles to manifest themselves. Newly dropped calves are often infected through the naval cord. It is well to use bichloride of mercury (corrosive sublimate) tablets. These come ready to be dissolved in water. Wet the navel cord of the newly born calf or colt with it thoroughly. A certain way to kill a calf that has scours is to give it laudanum or paregoric. I never knew one to recover that had been given a dose of either of these medicines. Put away the soothing syrup and paregoric bottles, if you have not courage to dump them into the drain, for they are not good for babies either human or bovine.—M. E. Sherman.

Future Citizens of Kerman, California

J. W. Brooks, J. B. Beardorff, J. W. Lamb, J. W. Cook, E. M. D. Smith, C. E. Wells, C. F. Anderson and L. W. Brooks, all of Towner Co., N. D. Together they bought 220 acres of land March 18, and will help to make Kerman the richest colony in California.

Do You Know

That the east is burning up with land hunger? That productive lands are getting scarce and hence higher? Do you know that the people east are just beginning to find out that there are agricultural lands in California and hence that we are on the eve of the greatest emigration movement California has ever experienced.

Do You Know

That as a consequence it behooves all who are landless in California but who hope sometime to enjoy the blessings of a landed home, to get busy and to secure the home before the other fellow gets it, and before prices have advanced to where they are prohibitive? That the easterners who are coming here now are astounded with the agricultural possibilities of "New California?" That they are buying themselves, and then going back home spreading the news of their find, and inducing others to come?

Do You Know

That ere long the man who owns productive land here will discover its value, and will refuse to part with it at several times the amount it now takes to "lift" it, and that when that time comes it will be everlastingly too late for many.

Do You Know

That the value of land depends upon what it will produce per acre? That land on the **Kerman Tract** is today the cheapest land in the United States, value of possible products considered? That this fact is becoming known, and that it is bringing more people here than have ever come to any other similar tract in the same length of time?

Do You Know

That the **Kerman Tract** excels when it comes to water right, quality and lay of soil, natural drainage, location, and in possibilities for fruit and alfalfa growing, dairying and poultry raising? That it is unsurpassed, if equalled, in the things that go to both home and money making? That it is being populated by the very best quality of people, the cream of the country? That undesirable people are not allowed to buy land here and that those who locate are protected against the scourge which has ruined so many otherwise promising colonies in California? If you do not know these things now

We Are Telling You

And we ask the privilege of further informing you. If you are interested we would like nothing better than the chance to satisfy you upon all these points, either by correspondence or by showing you over the tract. We consider it a pleasure to show interested visitors over the colony, and all comers are accorded courteous and considerate treatment. Our circular explains in detail what is here, and it is free for the asking. Write for it, and do it now. But, what is better, come here and satisfy yourself that the **Kerman Tract** is as represented, and that you are not missing something that cannot be retrieved by not taking advantage of this opportunity now. Making Irrigation Ditches by Machinery on the KERMAN TRACT

On this tract, and in two months, over 6,000 acres of new land was put under water, and into fruit, vines and alfalfa.

The Aristocrat of Moderate Priced Cream Separators

We are often asked the reason for the great success of the

United States Separator

In a nut shell it is this:

U. S. Cream Separators are made of the best material, are most thorough in skimming and most durable in wearing qualities.

Every UNITED STATES owner will stand back of these facts.

In every line there is one best. Why? Because that one is the standard. So it is with Cream Separators, the **United States** is the **Standard Cream Separator.** Many thousands being operated in all dairy sections have established its value.

Promises and performances. There are cream separator manufacturers that promise great things—on paper—but in actual daily use their machines cannot fulfill their glaring claims.

When some glib salesman claims he has something equal to the **United States,** make him show you proof. *It is one thing to make a claim and another thing to prove it.*

The United States has the proof. For it ***Holds the World's Record*** for closest skimming in fifty consecutive runs, covering one month, at the Pan-American Exposition from the milk of ten different breeds of cows, a record never having been equalled.

Before you decide examine the **United States** carefully. Ask any of the thousands of satisfied users and get their verdict, then have a **United States** selling agent place a **United States** in your dairy on free trial and it will prove all claims.

In the meanwhile send for illustrated Catalogue No. 20

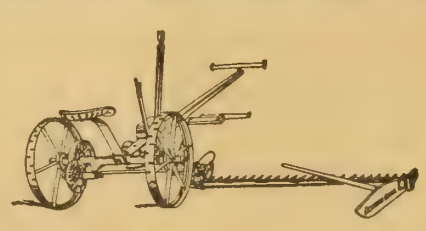
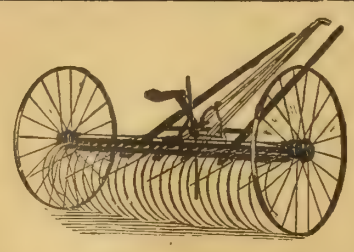
Prompt Delivery Assured California Customers from Stockton warehouse. No delays. Address all letters to Bellows Falls, Vt.





Seasonable Goods

Of special interest right now, are our Harvesting Machines, Hay Tools and Hay-Presses. We have made it our business to get hold of the best in these lines. We especially call attention to the following:

Deering Ideal Mowers; perfect shear-cut, ball and roller bearing—nothing better made.

Deering Ideal Self-Dump Rakes; strong, durable—fiirst class in every particular.

Dain Buck Rakes and **Stackers;** scores in use in Southern California. They are built right and will positively carry the teeth off the ground when heavily loaded. Power lift—easy to operate.

Southwick Hay-Press—without question the best horse-power press made. Many of our customers have averaged 30 tons per day or better for entire seasons' runs. We also have the Sandwich Engine power Belt Presses—of wonderful capacity. Smaller Presses, too—all steel, self feed.

See us or write us today.

TEACHING A FARM DOG.

A good collie will be ready to begin to learn to drive sheep at about three months of age. He should be taught wholly by one person.

First teach him to lead, placing a string about his neck. He will soon learn not to try to get away and to come on hearing the word "Here," or whatever word is chosen, pulling on the string until he learns to come promptly.

Lessons of half an hour a day are enough and this first lesson should be learned very thoroughly, so that the dog will come from any part of the yards instantly on hearing the word.

Next he learns the meaning of the word "Go" by using the word when sending him through an enclosure, continually repeating the lesson until he acts promptly.

As a part of this lesson he should be taught to stop anywhere on the word "Halt," emphasized at first by pulling on the string, which should still be attached to his neck.

The word "Ho" is also used by some trainers to indicate that the teacher is through with him for the time being and the dog soon learns to understand it.

While driving sheep it is convenient to have the dog understand the word "Speak," which means that he is to begin barking, and he can be taught the word very easily by holding up something which he wants to eat and using the word.

The meaning of "Out" is easily taught when the dog is in the house, by opening the door and pronouncing the word.

After this preliminary education he may go out with an old trained sheep dog. By running with him, the pup will soon learn much about the business, but should be watched to see that he does not try to go to the heads of the cattle.

After letting him try with the older dog for a few times he should be taken to the sheep or cattle without the other dog.—Texas Stockman.

DAMP STABLES.

Damp stables are caused by a lack of sufficient circulation of air to take up the moisture. When the barber wishes to dry your face quickly, he uses a fan to circulate the air about your face and thus take up the moisture. Every cow is throwing off from seven to ten pounds of water every 24 hours. It will condense on cold walls unless sufficient fresh air is circulated through the stable and often enough to dry it up. There is no other way to take up this moisture or prevent it.

In regard to the temperature of a stable, keep it at 50 to 55 degrees. But in all these things a stable must be properly ventilated and there is no other system which fills the bill all around like the King system.

KALE FOR MILCH COWS.

Kale contains 2.05 per cent. digestible protein, 8.2 per cent carbohydrates and .04 per cent fat; corn silage contains .95 of 1 per cent digestible protein, thus you see that kale from the protein standpoint is twice as rich as corn silage. Forty pounds of kale with 15 pounds of good vetch or alfalfa hay will make a fair ration for a cow giving an ordinary flow of milk; this with four or six pounds of mill feed will make an excellent ration for a cow yielding a large amount of milk.

Reports continue to come in that are favorable to Arabian alfalfa.

ABSORBINE

Will reduce inflamed, strained, swollen Tendons, Ligaments, Muscles or Bruises, Cure the Lameness and Stop pain from a **Splint, Side Bone or Bone Spavin** No blister, no hair gone. Horse can be used. **Horse Book 2 D free.** $2.00 a bottle at dealers or delivered.

THE MERRY COUNTRY MERCHANT AND THE MAIL.

Oh! lightsomely it's said that if he's
to earn his bread,
And pay his debts in season without fail,
The merry country merchant, be his
needs never so urgent,
Must not send his parcels through
the U. S. Mail.

Unless he pays Express rates on packages, I guess
(Tho' extortionate enough to make him pale
Like Death on a white horse), it'll follow in due course.
He'll be bankrupt and forever ever fail.

For the press still says "That's so,"
and of course it's all "no go,"
For a verse-maker 'gainst editors to rail;
And these ink-slingers all swear that our Congress dassent dare
To kill kind country merchants with cheap mail.

My! wouldn't it be awful if they could not get their craw full
Of gold dollars farmer-earned at the plow's tail!
So scrub politicians' jawful of fool talk says it ain't lawful
To carry farmers' parcels cheap by mail.

On their sending to Chicago must be put a strict embargo
And big tax of 16 cents per lb. by mail;
But the farmers only laugh at such silly d*** f*** chaff
And purchase thrice the goods by freight per rail.

For they get them at less cost than they would by parcels Post
In spite of all this silly, silly wail
Against the introduction by our Congress of instruction
To reduce the rates on parcels thro' the mail.

Then, my merry, merry merchants, won't you join with us insurgents,
And boost the Parcels Post at which you rail?
Stop your free "ad" of Chicago?—Save your big pay to Wells Fargo?
Won't it help you, too, to get goods cheap by mail?

If you must be small and narrow,—why,—haul your freight in a wheel-barrow,
Or pack it on a sheep with a broad tail.
If wise, just make concession! Keep up with the procession!
Americans! Have faith in your own Mail!

—Edward Berwick.

HOW TO PREVENT LAND FRAUDS.

Advocates of the Torrens system of land records in Chicago are pointing out that a repetition of the Van Vlissingen colossal mortgage forgeries in that city would be rendered impossible were the Torrens law of transfers generally invoked. In Illinois, according to the Appleton (Wis.) Post:

"The Torrens system provides for the title to real property being determined by a state court, and if found good, being guaranteed by the state, which issues as evidence of it, in the place of a deed—a certificate of stock. When property is sold the certificate is indorsed over to the purchaser. The purchaser takes it to the recorders' office, where the certificate is canceled and a new certificate issued in its place in the name of the purchaser. There are no abstracts. The certificate carries with it the state's guarantee of absolute title. When a man wants to borrow money on his property, under the system he puts up his certificate as collateral security and that is all there is of it. There is no mortgage."

One inferential objection voiced by the Evening Wisconsin is that in a comparatively new country like Australia, which originated the system, its adoption did not involve a revolution. The trouble with the law in Illinois is that its adoption is optional with property owners, and the abstract companies, as in California, control enough members of the legislature to prevent the Torrens system from becoming too popular by removing certain drawbacks. One feature, not yet included in California, is the state's guarantee that the title is perfect, a defect that Senator-elect Thompson of a local title and trust company should be invited to cure by a senate bill at the coming session of the legislature. It is certain that with the Torrens system in use the people in this county would save thousands of dollars annually, besides making it an easy matter to negotiate a loan. A Torrens land certificate with the title guaranteed by the state, as in Illinois, would be as good as a bond and as acceptable for collateral as a bank note. Forgeries of the Van Vlissingen type could not be practiced.

But, alas, the system is too simple, too economical, too convenient to hope for its general adoption. The opposing interests would never consent to be put out of business without striking a terrific blow for their abstract books, their guarantees and their fees. When we get honest tariff revision we only get the Torrens law. —The Los Angeles Graphic.

Apricots at Biggs will be short crop, all other fruits large.

STATE FAIR.

Agricultural Park at Sacramento is now a very busy place. State Engineer Ellery and his staff have lost no time in getting to work on the new buildings at the State Fair grounds, and are now busy on the three structures that are to form the outlines of the grand court which it is intended to have open to the view of visitors from the main entrance of the park.

With the splendid new buildings, a complete water system, and some comprehensive landscape gardening, Agricultural Park will be an attractive place, and will prove as instructive as interesting. The fact that one admission will take the visitor to every portion of the show will prove an inducement to attend the coming fair, which even this early gives promise of being a record breaker.

The May issue of the Dairy Bulletin, published by the Vermont Farm Machine Co. to make better known the merits of the U. S. Cream Separator, is an unusually interesting and informative publication. Beside being well illustrated with half tone engravings, there are several well written articles that will appeal to every farmer and dairyman, (owners of Guernseys will be particularly interested in this issue) besides complete descriptions of the various models of U. S. Separators. A copy of this publication may be obtained free for a post card requqest by addressing the Vermont Farm Machine Co., Bellows Falls, Vt.

ALFALFA.

The next subject which will be given special attention in the series of articles similar to the plowing and irrigation articles which have been given within the past few weeks, will be alfalfa. There are many questions connected with alfalfa seeding and culture which are worthy of debate, and we have been requested to take this up in a similar manner to the treatment accorded the other subjects. To the end that this may be as valuable as possible, we ask those who are specializing on alfalfa and are able to give some particular points, to communicate with us within the next two or three weeks with such information as they may have.

We have in hand now a letter from Mr. C. K. Meyer of Tuolumne, in which he refers to an Arabian alfalfa and his experience with it as follows: "A recent editorial in the Cultivator discussed Arabian alfalfa and expressed a doubt as to its hardiness. I have had it growing here in a small way for the last three years and find it hardier than the common variety. The first heavy frost will kill what remains of the summer growth; then it will start a new growth and remain all winter and be a foot high before the common variety starts at all. It also seems to grow better on dry ground than the ordinary alfalfa. I have tried to get it to make seed here the past two seasons without success. It blossomed freely but made no seed."

Information on such points, especially as to its habits of winter growth, are of great value, particularly to those located in colder sections. The last sentence of Mr. Meyer's article shows his experience to be along the same lines as that of a Holtville, Imperial county, grower who has been unable to get this plant to seed. Subscribers who have had similar experience or who have been able to make it seed will extend the usefulness of this plant if they will tell others what they have learned.

HARDWOODS IN CALIFORNIA.

The Pacific Coast will soon be the scene of an interesting tree growing experiment. The United States Forest Service is planning to introduce a number of the more important eastern hardwoods into California, and writes us that the service will this year experiment with chestnut, hickory, basswood, red oak, and yellow poplar or tulip trees. Small patches of these trees will be planted near the forest rangers' cabins on the National Forests,, and if these do well larger plantations on a commercial scale will soon be established on wider areas.

There are over 125 different species of trees in California, a number of which produce some of the most valuable varieties of lumber in the country. Although considerably over one-half of the species are hardwood or broad-leaved trees, yet, with the exception of the exotic eucalyptus, there is not a single species of hardwood here ranking in commercial importance with the leading eastern hardwoods. Climatic conditions in many parts of California are undoubtedly favorable for the growth of a number of the valuable hardwoods, and the absence of these trees is due mostly to unfavorable factors of seed distribution.

If the experiments are successful, a valuable asset will have been added to the forest resources of this State, which should prove of special benefit to the local furniture and vehicle industries. Chestnut and red oak are highly esteemed for furniture, while with hickory, basswood, and eucalyptus at its command, California should lead all other states in the vehicle industry.

CO-OPERATE.

Farmers never gave so much thought and effort to securing co-operation in disposing of their products as they have for the past few years. There have been enough pronounced successes along this line to give encouragement. There have also been, as was always the case, enough failures to discourage the weak-hearted. But the greater intelligence which has been called into being by these endeavors, is making a showing of results which will greatly aid future efforts along this line. One great danger lies in unscrupulous or designing people masquerading under the guise of friend to the farmer in the effort to secure personal advantage, but if the farmer will use due intelligence and secure the aid of only men known to be honest and to have ability, there is no reason why he cannot market his products through his own organization to vastly greater advantage than through the old method of taking whatever the tradesman had to offer.

COUNTRY LIFE BOOSTER.

The Spokesman Review of Spokane, Washington, has inaugurated a novel and desirable feature in its paper. It is the securing of a great number of members to its "Boosters Club!" The creed or the injunction which every member has to subscribe to is contained in the injunctions as old as the scriptures: "Whatsoever things are true, whatsoever things are honest, whatsoever things are just, whatsoever things are pure, whatsoever things are lovely, whatsoever things are of good report; if there be any virtue, and if there be any praise, think on these things.

"To think well of country life, to speak well of it, is the first important step in boosting for it. This underlies progress in all departments of life."

That is a good creed and if every reader of the Cultivator will live fully up to it we believe country life will be made purer and stronger thereby. If there is any place in the world where one can find things that are true, honest, just, pure, lovely, it is under the blue skies which are untinged by sooty smoke and are practically always over the heads of those dwelling in the country and rural districts. The "Good Report" is not so all-prevailing, for sure it is if there is any place in the world where evil is spoken of its own community it is in the rural districts. The inhabitant of the city becomes so imbued with the spirit of growth and progress in his own community that he gives it undue importance and becomes even boastful. Let the farm home maker be as satisfied with his own surroundings, for they are well worth receiving greatest praise.

WRONG IMPRESSIONS.

The management of the Alaska-Yukon-Pacific Exposition has taken exception to the action of the Post Master General in accepting the design which he has for the postage stamps issued in commemoration of the A-Y-P Exposition. The central figure on the stamp shows a seal standing by a cake of ice, in deference to the popular impression of the conditions in Alaska. The Exposition management maintains that the whole object of the Exposition is to show the agricultural possibilities of Alaska and to give a more intelligent view of the resources of that valuable country. To that end they do not wish the prevailing prejudices as to ice-bound conditions to be given impetus by this design on the postage stamps. They are taking all steps possible to secure a reversal of the decision and the adoption of a new design.

It is said that among the exhibitions from Alaska made during the Exposition will be a large agricultural display, especially of live stock, and they will show photographs of scantily clad Indians picking strawberries, and other such features to endeavor to advertise agricultural Alaska.

AUTOMOBILE IMPUDENCE.

In the effort to secure better control of automobile speeding parties, Santa Barbara officers have been very alert and have made many arrests. This has resulted in more wholesome respect for the laws in Santa Barbara county which as a rule have been fully supported by the more responsible and reputable automobile owners. The speed maniacs, however, have objected to any control of their desires, and a few have decided to boycott Santa Barbara county by going around it on their trips north or south. To such drivers, we presume Santa Barbara officers will only say "good riddance." The automobile is too valuable a machine to have its usefulness impaired by these reckless drivers, and Santa Barbara's action should be supported and imitated.

IRRIGATION CONGRESS.

The Seventeenth National Irrigation Congress will be held in Spokane, Washington, U. S. A., August 9 to 14, inclusive, 1909. The four great objects of the Congress are to "save the forests, store the floods, re-claim the deserts and make homes on the land."

It aims to demonstrate to the West, the wonderful development possible through irrigation, drainage, forestry, deep waterways, good roads and home-building; and to show to the East the economic importance to the whole country of this development.

California has always had full representation and we doubt not it will this year.

FARMERS INSTITUTE WORKERS.

The next annual meeting of the American Association of Farmers' Institute Workers will be held at Portland, Oregon, August 16 and 17, 1909. At the same place and beginning August 18 will be held the annual meeting of the Association of American Agricultural Colleges and Experiment Stations.

This is the first time that the Association of Farmers' Institute Workers has met upon the Pacific coast.

Agricultural Notes of the Pacific Coast

Northern California

The plum crop this year will be large.

Alfalfa is selling in the cock in Sutter county at $8.

Yolo country is planning for a good county fair to be held this fall.

Pastures of Marin county are rapidly drying from lack of rain fall.

One shipment of 190,000 eucalyptus trees was recently received at Marysville.

The Santa Rosa Creamery Company has secured control of the creamery at Auburn.

The next meeting of the Sonoma County Grange will be at Geyserville on Saturday.

The attack of glanders among the horses about Gridley is demanding heroic measures.

A new and substantial dam will be built during the coming summer at the outlet of Lake Tahoe.

Work has been started on a new winery of 500,000 gallons capacity at Dry Creek, Sonoma county.

Condemnation proceedings are about to be begun at Yuba City, Sutter county, to condemn land for right of way for drainage.

Entomological experts who have been investigating the thrips plague are hopeful that the pest may be brought under complete control.

The new firm handling the creamery at East Auburn, Placer county, is Tupper and Stevens. This is one of the best creameries in the state.

It will take 1,700 enumerators to take the U. S. census which will be in order next year. The census must be taken in two weeks from April 15, 1910.

The Crocker National Bank of San Francisco has begun suit against the defunct Coldbrook Creamery of Humboldt county on account of money loaned.

A hydraulic miner who disregarded the State's law for discharging slickens into the navigable streams recently made good by depositing a fine of $500.

The Sierra Water Supply Co., in El Dorado county, has proposed to furnish free water to farms under ditch system in order to save crops endangered by the continued drouth.

The shortage of hay last year has resulted in an almost complete clean-up in all the markets. The late rains holding off as they have will also make crop rather short of previous anticipation.

The widespread prevalence of glanders is causing much loss and great concern. Several counties are more or less affected. On one large ranch there were recently destroyed 154 horses valued at $10,000.

The Government Inspector who has charge of the passing upon butter for the Navy manufactured at the Central Creamery is now called to Eastern work and his place will be taken by J. H. Severin of San Francisco.

Entomological experts from twelve states recently convened at Berkeley in the first session of the Pacific Coast Entomological Association. Prof. C. W. Woodworth, of the University of California, is President and Prof. W. B. Hermes, also of California, is Secretary.

Central California

Visalia prunes will be above the average crop of prunes this year.

The county sheep inspector of Kern county reports the dipping of over 400,000 sheep.

Reports from Santa Clara valley prune orchards indicate a heavy crop of large sized prunes.

Most of the apple growers of Watsonville have finished the first spraying for the coddling moth.

Terra Bella, Tulare county, is making a good showing of winter sowing grain. The harvest will be big.

Delano recently had a rabbit drive and make a round up of something less than 10,000 of the varmints.

The Fair Oaks creamery at Tulare has been sold, or at least a gentleman from Chicago has purchased a half interest.

Lucerne Cream & Butter Co. at Hanford recently made its record run by an output of 4,806 lbs. of "extra" butter.

The Weather Bureau will establish observation stations in the mountains for the purpose of measuring the fall of snow.

A coporation has been formed for the purpose of securing irrigation waters from Tulare lake. The water will be pumped.

The Tule River Citrus Association of Tulare county has voted to dispose of its coming crop through the California Fruit Growers Exchange.

Fourteen thousand acres of some of the richest land in the San Joaquin valley covered with growing grain was recently flooded by a break of the levee.

A Stockton man has a valuable variety of Capri figs planted some 35 years ago which is said to be an exceptionally fine form of this fertilizing variety.

San Joaquin Valley papers are appealing to the farmers to raise berries sufficient for the local market. At present most of the berries are shipped in from the south.

Large sums of money will be spent during the coming summer in the construction of roads, trails, telephone lines and other permanent improvements in the National Forests.

The Santa Clara Valley Pet Stock Association is planning for a big meeting, in fact an all day session, on June 3rd at Agnews. A model poultry farm will be one of the principal attractions.

Fruit growers are discussing the advantage which came to the raisin people from the recent advertising campaign and asking wherein the same advantage may be secured by other fruits.

The contention between the Board of Horticultural Commissioners of Tulare county and shippers of orange trees has resulted in the trees being cleaned to the satisfaction of the commission and they are now allowed to be planted.

The Kingsburg Co-operative Creamery Association and the Selma Dairy Association in Southern Fresno county and the Traver Co-operative Co. have consolidated. Hereafter the butter will be made at Selma, the other two points being used as separating stations.

Southern California

Coachella grape vines are loaded with fruit.

Cabbage growers have struck it rich all through the season.

A great many apricot trees were planted during the past season.

Potatoes have proved a profitable crop about Brawley, Imperial county.

El Centro claims that she will ship about 500 cars of cantaloupes this year.

Onion growers of the Coachella Valley have received two cents per pound, net.

San Bernardino apple growers are having great trouble this year with wooly aphis.

The Lima Bean Association has decided to form a corporation with $250,000 capital.

The Queen Colony Fruit Exchange of Corona shipped over 200 cars of citrus fruit during April.

The American Beet Sugar Co. of Oxnard recently entertained about 500 guests, mostly employees.

Brawley potatoes planted in the middle of January were dug on the 10th of April and were of fine size.

Chino, San Bernardino county, has a big grain crop and is arranging for threshing machines from the outside.

The Egg Association formed at Los Angeles recently is getting into shape for handling the products of its members.

An Oxnard sugar beet grower has patented and is manufacturing a new form of beet cultivator said to be most satisfactory.

The Richland Walnut Grower's Association will build a new packing nouse and have it completed in time for the coming crop.

Dr. Perley Spaulding, pathologist of the Bureau of Plant Industry, is in Los Angeles investigating as to damping off and other diseases of eucalyptus.

Forest Supervisor Charlton of Los Angeles has announced that on June 16th civil service examination will be held for thise wishing place in the forestry service.

A slight shock of earthquake caused an upheavel in the mountains near Santa Paula so that the entire face of the mountain and a canyon have been greatly changed.

Complaint comes from all portions of California, that the army worm is doing great damage. The damp cloudy weather of the last few weeks is favorable to their increase.

The high winds prevailing for some days in the Imperial Vallely have been exceptionally hard on the bees which are unable to fly against the wind, heavily laden with honey.

Work is progressing on the spreading of flood waters on the upper Santa Ana river, on waste land which will carry the water into the lower levels from which it may be discharged during the later summer months.

Since the State Pure Food law has become effective, egg dealers have been busy inquiring as to what constitutes a storage egg. One dealer wishes to know if he puts his eggs in the refrigerator over night if he must label them cold storage eggs.

The Coast

Portland potatoes have advanced in price and are quoted at $1.60 per hundred.

Clarkston, Washington, sheep are averaging about 12½ pounds of wool apiece.

One potato grower in Glenwood Springs recently sold five cars of spuds for $1.65 per hundred.

Ninety per cent of the Utah spring clip of wool has already passed from the hands of the wool growers.

The U. S. Forest Service is joining with the stockmen of Arizona and New Mexico in a campaign against prairie dogs.

The State Experiment Station at Puyallup, Wash., now has 13,000 incubated chicks in its experimental plant.

By recent order of the Interior Department a vast quantity of land will soon be available under the new Homestead law.

The officers of the state penitentary of Washington are selling jute sacks at 6 cents delivered anywhere in the state. The sacks are the standard size 22x36 inches.

North Yakima hopes for an early reclamation of 5,000 acres of land through conducting to it of water from the Klickitat river.

The Bureaus of Agriculture and Forestry of Hawaii is making a collection of native woods to form a part of the display at the A-Y-P-Exposition.

The Horticultural inspector at Walla Walla, Washington, has served notice on the fruit growers that coddling moth must be more completely controlled this year.

Hundreds of thousands of dollars in property was destroyed and scores of ranchers forced to flee for their lives as the result of a bush fire near Kamloops, British Columbia.

The Northern Pacific and the Great Northern join in demonstration train service which will be run during the most of the month of June in farm sections of Washington.

The 5th annual horse show at Waitsburg, Walla Walla, county, Washington, held on May day was a complete success. Over $100,000 worth of high bred animals was exhibited.

The Senate and House of Representatives of Hawaii recently united in a joint session to listen to an address on Conservation of the National Resources given by the Governor of the territory.

Hawaii publications urge the taking advantage of shortage in the California potato crop owing to the heavy floods in San Joaquin and Sacramento valley by planting large acreage on the islands.

Peach growers at Dayton, Wash., and Snake River valley are thinning peaches of a part of the enormous crop which has set. The Eastern part of Washington will have no peach crop at all on account of severe cold weather.

The famous Hazel Fern farm near Portland, Oregon, which comprises about 460 acres of fine farm land and a large number of the finest Jerseys in the world, recently sold for $2,000,000. Its great value was largely due to its nearness to the city of Portland.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

POULTRY INDUSTRY OF CALIFORNIA.

MR. L. C. BYCE, president of the Petaluma Incubator Co., and often called Father of the Poultry Industry of California, recently prepared an address on the poultry industry and it is so full of fact that we quote in full:

Since its inception, only a comparatively few years ago, the poultry industry of the State of California has made advancement greater than that of any other section of the world. Thirty years ago if one wished to procure 500 or 1000 hens to stock up a poultry ranch they could not be obtained except by having them shipped in from the east, and even now if a poultryman has for sale a like number of fowls he scarcely needs to go beyond his neighbor to find a customer. In the great chicken centers of Petaluma and Santa Rosa, with their nearly one and one-half million hens, one would very naturally expect to be able to buy any number of fowls desired, but there, as elsewhere in the state where fowls are kept, the local demand is so great for stocking up the ranches being started in the immediate neighborhood that only the old hens—too old to be productive—ever leave the vicinity and buyers from remote sections are somewhat surprised at not being able to find anyone willing to sell laying pullets.

There is a reason for all this, or it may be said there are many reasons, all of which contribute to make California the most desirable place for poultry raising. Who ever heard of poultry ranches in any other state in such numbers and carrying from 800 to 8000 fowls on a ranch. Tributary to Petaluma and Santa Rosa there are over 800 poultry ranches having from 1000 to 8000 laying hens each. Other sections are rapidly coming to the front as great poultry producing centers. There is no part of our great state that is not adapted to extensive poultry culture, even the mountainous parts having some of the most favored places and poultry is not simply engaging the attention of those of small means or those whose health has failed them and are seeking outdoor employment, but owners of very extensive tracts are fast finding that no crop can be rasied nor can the producers of their acres net them as much as is secured through a well conducted poultry business. This is opening up the way for employment of a great many men competent to manage or conduct such places.

The soil of many of our valleys, large and small, together with the hill sides, are especially well adapted. The climate is particularly propitious. Housing is less expensive than elsewhere, markets are good and everything tends to make poultry raising easy and profitable to those who intelligently engage in the business. There is no room in the poultry business, however, for the careless or shiftless or those who think that "anybody can raise chickens."

Selecting a location is of great importance; oft times there is such a demand in the local market as to exceed prices paid in the larger cities, while feed is correspondingly cheaper, therefore it does not follow that one must locate near to the largest market to obtain the greatest profit for his efforts. It has become an old story to hear it said, "A hen will pay $1.50 per annum." There are numbers of poultrymen whose word would be accepted on any other subject as truth who say they have made as high as $2.25 net per hen per annum, and the man who cannot show more than $1.00 per annum belongs to some other line of work than in poultry raising. The prevailing high price of feed for the past year has not been without its beneficial side. While poultry products are bringing uniformly good prices and feed moderate in price, poultrymen were somewhat inclined to be satisfied with the good returns, but when feed made very material advancement in price the thoughtful and considerate poultrymen immediately began to weed out all old and limited producing fowls, thereby resulting in a largely increased average for the flock as well as a decreased consumption of food and a resultant satisfactory profit.

But what of the future. It is a fact that California is producing less than half of its present requirement in the poultry line. A leading Chicago paper recently deplored the fact that the American hen had completely failed in her duty, hence eggs were commanding a price of 36 cents per dozen wholesale in that city. Corresponding reports come from other places clearly defining the fact that over production is something for future generations to worry over. This is not only true for our own United States, but the report comes from one consul general, Richard Guenther of Frankfort, that Germany is not able to supply her home demand for eggs and in 1907 imported $34,643,000 worth of eggs.

In view of all this, little need be said of the future for California as a poultry producing state. With eggs reaching a maximum in the San Francisco market of 57 cents per dozen, the long continued range of high prices, the insufficiency of home supply; the shipment of eggs into the eastern markets at favorable times, the apparent lack of supply everywhere to meet prevailing conditions, the unusually favorable climatic conditions of California, the adaptability of soil so universal throughout the state, the freedom from disease and the assurance of good market conditions should appeal to every right calculating man that our state is truly the poultryman's paradise.

POULTRY QUERIES.

Roup.

What is a good cure for roup? What is the matter with my little chickens when they become lame for two or three days at a time.—M. S., Vacaville.

There are several good roup cures advertised in the columns of this journal; why not try some of these? Should suspect over-feeding of rich food, in the case of the little chicks, which causes liver trouble, and resultant lameness. Many chicks die from over-feeding during the first

weeks, and a diet confined to chick food, and water is safest for the first three weeks, gradually adding meat and mashes, after this period.—Mrs. F. M.

Losing Feathers.

Have some chickens that are losing feathers on their backs, and when so affected, are unfit for food.—V. V.

You do not state your case very clearly, and I must answer at random. If your chickens are hens, they are suffering from a too attentive male who scratches the feathers off their backs, and he should be taken out part of the time. If you are up against the depluming mite, which is an insect invisible to the naked eye, which eats the fluff off the feathers, making them look scraggly and hideous, I am sorry for you, for I was troubled with it, and found no remedy until I made a strong tea of tobacco stems and washed the hens in that. Of course their beauty was gone until they got a new coat of feathers. It in no way affected their health, and they would have been all right for the table, but were extra good breeders, so I kept them. They show no signs of it this year, and I think the tobacco tea "fixed" the insect, all right.

To make the tea, I procured at a cigar factory a pound of stems, which I steeped in two gallons of water, and put into a tub holding perhaps ten gallons although it was not more than half full. Then I washed those birds thoroughly, rubbing it into the feathers well, which is no easy task, for feathers object to wetting through, and it takes time and patience to get every little feather soaked to the skin, yet that is just what must be done. The water was kept at nearly blood heat, so as not to chill them, and the work done in the hottest part of the day, so they could sun themselves dry, and not one took cold. This is also a good plan to kill the body lice, but is rather apt to smart the eyes, and they should not be allowed to swallow any.—Mrs. F. M.

Feed for Young Turks.

Will you please tell me if cracked Egyptian corn is good for young turkeys? I have been told that it is not. What is the best to feed them?—Mrs. Wm. H.

In the Cultivator of Dec. 17, 1908, is given a method of feeding turkeys which was so successful that I consider it worth repeating, and those who have saved the issue in question must excuse the repetition.

It was written by D. H. Hammons of Highland, a gentleman who has the modest ambition to own a 6,000,000 hen plant some day, to which end he is now beginning with a little $100,000 broiler factory which will be described in these columns later on.

He is a medical college graduate, but discarded his diploma for hens, and is putting all the energy of a keen, educated brain into these hen problems and as he is a tireless worker, success is sure to be his.

He says: "I will tell you how I feed my turkeys and the results therefrom: To start with, we never brood turks in the natural ways, but use the cold brooder, which gives far better results. The wobbly little fellows are taken from the hen, whether chicken hen or turkey hen, and dusted with insect powder, and the bedding in the brooder is also dusted. Then the turks are placed in the brooder and allowed to snooze for 24 hours, not less than 15 being placed in a brooder

Coulson's POULTRY FOODS
Special Dry Chick Food
Makes Them Grow

Throw it out in the Litter and Make them Work

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequaled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the present high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed, to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE-SAVER. Write us for free samples and prices.

FREE TRIP TO SEE THIS HAY PRESS AT WORK

LOS ANGELES AND RETURN AT OUR EXPENSE

WE PAY YOU TO INSPECT THESE HAY PRESSES.

Instead of paying a salesman's fare to show you a small model of a hay press, we will pay your fare to Los Angeles and return, not exceeding $15.00, to examine our California Special New Century, full circle, all steel, self feed Hay Press and all others on sale there. It makes no difference which hay press you buy, we pay your railroad fare just the same.

When you see for yourself how this machine has been built expressly for heavy baling on the coast, how strong it is, how easy it is on horses, what smooth bales it turns out, you will understand why we make such an offer. It has 7-in step-over, pull power, high baling chamber, positive plunger rebound; it stands up to its work, no taking off of wheels. Has record of 39 tons per day. We will ship you one to try. If you don't want it we will pay freight both ways. Write now.

ARNOTT & CO., 118 South Los Angeles St., LOS ANGELES, CALIF.

18 inches square. The next morning the little brooder door is opened and out they tumble. Then they get their first meal, which is a light one, as they do not eat much the first two or three days, and is made as follows: Stale bread, 40 per cent; hard-boiled eggs, 40 per cent; onion tops 10 per cent, and lettuce, 10 per cent. This is ground fine, and sprinkled with sand.

"The turks are fed four times a day on the same ration the first three weeks, then we gradually shift to cracked wheat and cottage cheese. This is fed until they are about eight weeks old. After this they are fed wheat, barley and beef scraps from a hopper. At first they are only let out of the brooder 20 minutes at a time, as they chill easily. After they have learned to go back to the brooder themselves, when cold, the brooder door is left open all day. As soon as the turks are strong enough to run about, the brooder is put out on the lawn, where they can pick clover, etc.

"From 53 eggs hatched from three hens and a tom, 50 were raised to maturity. Two were weak, and one was drowned, the ones sold netting $5.00 each. (N. B. My wife raised these turkeys.)"

White Guinea Eggs.

Where can I obtain white guinea eggs for sale?—C. E. U., Hanford.

We know of no place and we ask our subscribers to give us information on this subject as to what they know of such birds.

HOW TO FAIL WITH POULTRY.

1. Endeavor to keep two fowls where room for one only can be obtained, that is, saving expenses by cheapening the cost of houses and space.

2. Buying fowls from other farms and thus bringing disease and lice into the flock.

3. Overfeeding, the fowls being supplied with the greatest abundance under the supposition "the more feed the more eggs."

4. Cold draughts over the fowls at night with a view of supplying fresh air.

5. Wasting time with sick fowls instead of destroying all birds that cannot be quickly cured.

6. Disregarding the breeds by keeping anything that is a fowl.

7. Lack of exercise, the fowls being idle, discontented and consuming food because they have no warmth in winter, a season when eggs are highest.

8. Feeding three times a day, the result being indigestion and the introduction of disease into the flock.

9. Lice, both mites and the large lice that are found only on the bodies of the fowls, and at all seasons of the year.—The Ranch.

Protein feeding means providing fowls with albuminous ingredients such as meat foods, certain kinds of vegetables and clover. Grains contain protein too but not in sufficient quantities to make a strictly grain diet economical for egg-production nor for the best normal development of growing chicks.

Sulphate of iron, which can be purchased at almost any grocery store, and costing about 5 cents per pound, is a good tonic and mild disinfectant to put in the poultry drinking water. A solution of chlorate of potash in vinegar is good for canker sores in the mouth and throat of fowls.

Contrast a dried out, weather-worn strap from a harness ignorant of oil, with the soft, glove-like springy quality of leather oiled with

EUREKA Harness Oil

Think how much better the leather looks; how much *easier it is for the horse;* and how much longer it will wear. Nothing like "Eureka" Oil to make a harness soft and black Ask your dealer.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Government Land in Colorado.

I notice in the Cultivator that there has been 200,000 acres of land thrown open to public entry in Colorado. Can you tell me who to apply to and where to write for information regarding this?—E. J., Hanford.

We can give you no definite information on this subject but think that by writing to the United States Land Office, Denver, Colorado, you may get the desired information.

An Acre.

Please advise me through your columns the exact dimension, in yards, of one acre of ground. A says an acre is ten rods wide and sixteen long. B says it is ten rods square.—F. B. B., Princeton.

A and B should not have quarreled over so simple a proposition as this. The old arithmetic or reference to the dictionary would quickly have settled the whole scrap. Webster says an acre is a piece of land containing 160 square rods or 4840 square yards. It is well to remember that an acre of ground is 43,560 square feet. The dimension in yards is exactly 60½ by 80 or in rods, 10x16.

Fungus Blight on Sycamore.

A subscriber noticing the defoliation of large sycamore trees in the Arroyo Seco running from Los Angeles into the mountains north of Pasadena sent samples of the leaves and asked if there was any way of preventing this defoliation. The leaves were curling up and dying and some were eaten apparently by insects and were occupied by small white worms. The matter was referred to Prof. R. E. Smith of the Southern California Pathological Laboratory and he writes:

The sycamore leaves which you sent me recently are affected by the fungus blight which is universal on these trees all over the world. The disease varies in intensity from year to year, but almost always defoliates sycamore trees everywhere at this season. A new crop of leaves is at once put out and there is no very serious damage.

Burning Charcoal.

Will some one please inform me through the Cultivator how to burn charcoal out of hard wood.—A. L., Chino.

Make a chimney by piling fine, dry wood and around that stand on end the other wood or if cut in short lengths stack up as high and as close together as possible end on end. Cover wood with about two or three inches of straw or leaves and cover with six inches of soil. Start the fire through the chimney and after well started cover top of chimney the same as the rest of the pile. Care must be taken that the fire does not break out or the entire pile will burn up. Close watch must be kept night and day until entirely burned out, which takes a week or more. The larger the pile the longer it takes. Soil which has body to it is better than light, sandy loam which is very liable to sift through and be hard to keep in a compact covering. It must not be opened until the fire is entirely out as a spark left in the kiln may consume the entire pile as soon as it is exposed to the air.

It is probable you will make a failure of the first attempt and one who has had experience advises securing skilled help for the first burning.

Wax for Wounds on Trees.

What is the best thing to use for painting over fresh cuts on citrus trees? Is there a mixture of resin and beeswax and one other ingredient? Please tell me what this is and how it is made.—W. A. L., Cucamonga.

Bailey says lead paint and tar are desirable. He seems to prefer them to grafting wax which is the wax you refer to. The wax you speak of is made as follows: One pound of beeswax, five pounds resin, 1 pint linseed oil. Some add a little turpentine or a little lampblack or a little flour and some prefer tallow to linseed oil, but the above formula is the regular formula. Mix with the aid of gentle heat. Use when grafting or pruning. When used for a coat over wounds keep warm enough to apply easily with a small brush. This may be done with a small oil lamp under a regular heater, or a tin dish on hot brick will answer.

Pomona Journal of Entomology.

Where may I secure copies of the Pomona Journal of Entomology of which you speak in the Cultivator of April 29th?—E. E. B., Escondido.

The Pomona Journal of Entomology is a quarterly publication and may be had by addressing Prof. C. F. Baker, Managing Editor, Claremont, California. The price is $1 per year.

Oil Stains in Carpet.

I note query for oil stains in carpets. I find the old time remedy of buckwheat flour or of fine corn meal stirred up in scalding water and applied hot, at once, is a good one. When dry scrape off and the oil comes off in the meal. We are afraid to use gasoline in a living room as the gas is given off for sometime and when lights are used may prove dangerous. —M. E. S.

Time to Plant.

When is the best time to plant onion seed to have them ready to transplant in November? Can mangel seed be planted after the first rains in fall or will frost injure plants.—A. H. N., Tropico.

Onion seed after planting requires about two months before being ready for transplanting. In most sections of California the mangel may be planted after the first rains as it requires quite a frost to injure them. If the frost holds off until the plants are a few inches high there is no danger whatever.

Fertilizing.

Please inform me if better results are obtainable by using potash and phosphoric acid, chemically pure, instead of plain fertilizer rich in the above mentioned elements. If so, kindly state best time to apply it. Also how much of each ought a tree to have that is about 15 years old?—O. E., Ontario.

The best information we can give on this subject is to refer the writer to a long article, written by Mr. Frank

P & O
Garden Plow and Cultivator

Berry Plants of All Kinds.

J. B. Wagner
Pasadena, Cal.
Rhubarb and berry specialist

Suisun, Salano county, is putting up strong opposition to the drainage scheme proposed for the Yolo Basin.

Palmer of North Pomona, and published in the Cultivator of May 14 and 21, 1908. That treats of the fertilizing question in a way most practical and touches especially upon the use of the simples. Unless one understands the needs of the particular kind of fruit, the use of a complete fertilizer would be safer. As the inquirer does not say what kind of trees or their condition or the nature of the soil it would be impossible to give an estimate as to how much of the various elements to apply. It would be impossible to apply "chemically pure" potash or phosphoric acid. Potash is usually bought in the form of muriate or sulphate and the phosphoric acid either in phosphate rock or bone meal.

Onions from Seeds and Sets.

When is best time to plant onion seed to raise sets, to plant in October? And how many pounds of seed (Australian Brown) will it require to raise enough sets to plant five acres? Will they require irrigation? or is it not better to simply irrigate enough to germinate seed? Do you think it cheaper to huy or raise sets, everything being equal?—An Old Subscriber.

Seed should be planted not later than May 1st. A month earlier would be better. It requires about 300 pounds of sets to plant one acre—or about five pounds of seed. Whether they will require irrigation depends entirely on the character of the land. The most successful growers of onion sets have land with water near enough to the surface to supply all the needed moisture by capillary attraction—consequently no irrigation is needed. Such sets are worth more than when grown by irrigation. Unless one is skilled in the work it will be cheaper to buy the sets. The skill and knowledge is where this querist will discover that things will not be otherwise equal.

Any one, with only the limited experience indicated by these questions, to attempt to grow five acres of onions and make a success of it, will find the venture unprofitable. Better far, confine the work to one acre, until you learn how. The novice has no conception of the labor involved in growing an acre of onions, even under the most favorable conditions. I should think to grow the Australian Brown by sowing the seed about February 1st would give better results than to plant the sets in October. Planted in October will bring them too early. The market demands this variety for fall and winter use. The New White Queen or the White Bermuda are better planted in October.—Q. A. L.

Sulphuring Grapes.

I had much trouble with rotting of prapes. Have been told it is mildew. Could not apply Bordeaux last season but will next. When should I sulphur?—H. S. T.

Sulphur at once. The amount of vineyard to be sulphured has something to do with the way it is applied. We are using a Cyclone horse powder machine in the vineyards here. While some of our neighbors are still using the old time hand bellows and others the tin sprinklers. The Vilmorin and Julian knapsack machines are also in use. If there are only a few vines it could be done with the sulphur tied up in a piece of gunny sacking. However remember this will only check the spread of the mildew and will not restore the shoots or leaves already injured. Mildew has finished its destructive work when it can be seen by a casual observer. When it completes its work it throws off spore that carry the disease to other vines, starting into life when conditions of heat and moisture are right. Sulphuring now puts the sulphur where the warm sunshine volatilizes it into fumes that quickly destroy the mildew starting into activity. By having it there to work every day and all day during the hottest hours it will stop the trouble. Sulphur will in a measure check the black rot of the grapes. Bordeaux spray in the winter helps a lot. Put the sulphur on early in the morning and stop when the dewy freshness passes out of the air. In buying sulphur, test it for fineness by rubbing it in the palm of the hand. Its color may be yellow or nearly white and be equally good, if it is velvety and fine it is good vineyard sulphur. Sulphuring is all you can do now and it may take two or possibly three applications to hold down the trouble. While this may seem a trouble still each time some of the mildew is prevented from reproducing itself and there is a gain in that.—M. E. S.

Mildewed Peas.

What is the best time to plant American Wonder peas? How shall we prevent the bugs from getting into them? Is Bordeaux mixture good to spray the peas to prevent mildew before blooming, also is it good to prevent mildew on any kind of beans?—Subscriber, Arroyo Grande.

So near the Coast, American Wonder Peas can be planted at any time. To state any one time as best, I should want to know whether grown for market or home use. Peas are usually most abundant in the market in latter part of March and during April and May. Grown out of the usual season, when the locality will permit, will give the best price—if grown for market.

I cannot tell how to prevent the bugs from getting into the peas, but they can be destroyed by fumigating with bi-sulphide of carbon. The peas should be put into a box or other tight vessel and a piece of waste or cloth saturated with the bi-sulphide placed inside and the box covered. Do not have a light or fire about as the gas is highly explosive.

Sulphur is the sovereign remedy for mildew and will do as well for beans as peas. It is the heat of the sun that fumes the sulphur and destroys the spores of mildew. It should be used as a preventive, as when the spores have once developed no amount of sulphur will destroy those particular spores. Bordeaux is used for fungus of another kind.—Q. A. L.

Cheese From Two Cows.

Will you please inform me if a farmer can make cheese from the milk of two cows? Is it profitable on such a small scale, and what is required for it?—A Subscriber, Selma.

Cheese making on a small scale is not profitable unless a special market can be built up for some of the fancy cheeses. In San Francisco or Los Angeles this could be readily done. The requirements are a simple press, hoops, cheese or curd knife, and other appliances. The greatest difficulty here is in curing the cheese, as the high temperature in summer is not favorable to making a good quality. The best bulletin I have seen on the subject is one issued by the Government some years ago. The latest book dealing with it is "The Science and Practice of Cheese Making" by Drs. Van Slyke and Publow. Price $1.75. I do not know the publisher's name. The Short Dairy Course at Davis offers great advantages to students.

Avocado Leaves.

I send leaves from my avocado (alligator pear) trees which are badly infested with some sort of scale. What is it, and what may I do for it?—Old Subscriber, Santa Barbara.

These leaves are plainly not infested with scale but show an appearance somewhat resembling that of fungus growth. Consequently, the leaves were forwarded to Prof. Ralph E. Smith who replies:

The avocado leaves are not affected by scale, nor by any fungus or other parasite. They look as though they had been injured by frost, wind or some other climatic condition.

Powdery Mildew.

I send leaves from my vines. Will you please let me know what it is that infests them, and the remedy? How often should I sulphur here along the coast?—J. S., Norwalk.

To this Prof. Smith replies: "The grape vine leaves are affected by powdery mildew, for which sulphur is a specific remedy, except, that cool cloudy weather prevents the action of the sun on the sulphur and thus we do not obtain its maximum effect under such conditions. Your correspondent should send to Berkeley and obtain bulletin 186, which covers this subject."

Diseased Apricot Leaves.

I send leaves of apricot trees affected with brown and dead edges. What is this disease, if it is such, and is there a remedy? I had one tree similarly affected two years ago, which ultimately died. This year there are ten affected in the same way. The trees are old, but apparently healthy otherwise.—A. K., Selma.

This inquiry was referred to Prof. Ralph E. Smith of the Southern California Pathological Laboratory, and he replies as follows:

The apricot leaves from the Selma correspondent are not affected directly by any parasite, but apparently have become unhealthy on account of not receiving a proper supply of sap from below. From what is said in the letter I imagine that there is something wrong with the roots of these trees and that the trouble is gradually increasing. I would advise your correspondent to dig down about the trees, examining the roots and also investigating the moisture condition of the soil as to whether the ground water is possibly too high at times.

Experience With Fly Repellant.

In response to the request in the current number of the Cultivator, I give the result of my experience with the fly repellant.

It did the work effectively—one good application kept the cows practically free from flies for from 24 to 48 hours. But I found two difficulties in using it.

In the first place I was unable to spray it on, it being too thick to spray, so I put it on with a paint brush.

In the second place, on hot days the cows suffered terribly from the heat, having great difficulty in breathing. I concluded that this was because the pores of the skin were closed by the oil.—W. P. Russell, Claremont.

Mildewed Pea Vines.

A subscriber called at the office recently with roots and lower branches of pea vines which had died or at least lost their productiveness, and wished to know if the small lumps or nodules on the roots were the cause of the poor condition of the vines, and if so, how might it be controlled. As a matter of fact the nodules were to the advantage of the vine and had added to their nitrogen gathering power. In other words, the appearance of nodules on the roots of leguminous plants is an indication of thrifty growth. These vines would have done well had they not been affected with mildew which showed very plainly on the leaves. The specimens were referred to Prof. R. E. Smith, and he writes:

"The trouble with the pea vines is a combination of mildew and the so-called "black mildew" (Ascochyta). The nodules on the root are those formed in connection with nitrogen assimilation and are therefore, beneficial rather than otherwise. It is difficult to control the two diseases mentioned in moist cloudy weather, such as we are now having. The usual remedy is sulphur dusted over the vines but this is not always effective in such weather."

Outfit For Canning Fruits.

Can you tell me through the columns of your paper where I can obtain outfits for canning fruits on a small scale?—J. S. W., Willowbrook.

The Canner's Supply Company of Detroit, Michigan makes a specialty of this class of goods.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Growth Over Eye.

I have a fine Norman colt one week old. It was born with a growth of some kind over its eyes. On one eye it has reached the centre of the eye almost covering the pupil and with this eye can see very little if any. On this growth there is a protuberance. On the other eye the growth only comes a short distance below the upper lid and with this eye it can see. The growth looks like a membrane and like the ball of the eye when bloodshot. In all other respects it is a strong beautiful mare colt.—G. F., San Benito.

It is impossible from your description to make certain diagnosis, but I think the growth is the "nictitating membrane" or eye washer that you can see in any horse's eye by a little pressure to the ball, it will come out from the inner corner and flash across the eyeball. Its function is the voluntary cleaning of the eye.

From various diseased conditions this is forced out and is unable to entirely return to its normal position. Its protrusion is one of the first symptoms noticeable in lock-jaw or tetanus and if that is the cause in your colt, it will proabably be dead before you read this. If not it is very likely due to some local inflamatory condition and I should advise the use of the following solution four or five times daily with a medicine dropper, only a few drops at a time.

Adrenoline one dram, water one ounce.

In some cases it becomes chronic and the only thing is to cut them off, this should only be resorted to after a long trial of other treatment.

Sores on Mule.

I have four-year-old mule who has apparently inflammation of bladder. Penis protrudes slightly, head is scalded, with white flakes on sheath, and an almost constant dribbling of whittish, thick fluid. Otherwise animal is in good condition, fat and willing to work. Pressure over kidneys seems to cause no pain.

Also what was the cause of death of two six-year mares I lost last year. I had a V. S. who knew how to charge, but not to cure. The mares both got thin and lazy, had difficulty in making water and finally died in great agony, one of them falling as though paralyzed after much staggering. The veterinarian I had called it inflammation of kidney. It looked to me like paralysis of neck of bladder.

I wrote Dr. Fox, V. S., Sacramento, and he said it was Azoturia, though no reliable book has any mention of the disease.—H. R. B.

There are probably sores inside of the sheath, you will have to make a thorough examination—not guess at it. If you find the sores, wash thoroughly and then use a solution of sulphate of copper and water on them. Make solution as strong as possible. The sheath should be washed daily and dioxide of zinc rubbed into the sores. You may find this line of treatment difficult, but it is necessary if you want to cure it.

As to the mares that died last year I think from your description that Dr. Fox was right. Any book that does not mention Azoturia is far from being reliable as the disease is almost as common as colic in some localities. —R. T. W.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.

Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT, soft,** steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Household Department

MY PA AND I.

My pa he didn't go down-town
  Last evening after tea,
But got a book an' settled down
  As comfy as could be.
I'll tell you I was offul glad
  To have my pa about!
To answer all the things I had
  Been tryin' to find out.

And so I asked him why the world
  Was round, instead of square?
And why the piggies' tails are curled?
  And why don't fish breathe air?
And why the moon don't hit a star?
  And why the dark is black?
And just how many birds there are?
  And will the wind come back?

And why does water stay in wells?
  And why do Junebugs hum?
And what's the roar I hear in shells?
  And when will Christmas come?
And why the grass is always green,
  Instead of sometimes blue?
And why a bean will grow a bean,
  And not an apple, too?

And why a horse can't learn to moo?
  And why a cow can't neigh?
And do the fairies live on dew?
  And what makes hair grow gray?
And then my pa got up, an' gee!
  The offul words he said!
I hadn't done a thing, but he
  Jes' sent me off to bed.

ONE OF THOSE THINGS EVERY Woman Knows.

"NO," said the young woman with the blonde puffs, "we hain't got a shawl in the store. They're not worn now, and we don't have no call for 'em."

Mahlon Jilson gazed helplessly around at the dazzling array of feminine wearing apparel with which the department store was filled. He had thought that a warm gray woolen shawl would be just the right present for his wife, and to be informed that "shawls are not worn" was decidedly disconcerting.

The young woman with the blonde puffs noticed his hesitation.

"If you're looking for a present for a lady," she said, as she shifted her gum to the other side, "you can't do better than take one of these waists. There isn't a stylisher thing in the store. I took one of 'em for myself the minute they came in."

She held up a flimsy confection of pink silk and white lace.

Jilson shook his head.

"It's—it's for a married woman," he stammered, struggling with a realization of the gulf which stretched between this frivolous creature and his Elvira.

"Why, that doesn't make any difference," responded the girl, cheerfully, she'll simply go crazy over one of these waists—any woman would! About what size is she?"

"About your size, I guess," said Jilson, a strange hypnotic influence stealing over him.

Just what happened after that he never could tell exactly, but a short time later he found himself walking proudly and happily up the street with that gorgeous pink white thing in a box under his arm.

By the time Jilson had unhitched his team from the rail in front of the postoffice, he was conscious of a slight doubt as to whether a black silk waist would not have been a more suitable choice than pink.

By the time he had driven the seven frozen miles that lay between town and home he was face to face with the grim fact that gingham wrappers, rather than silk and lace, were the customary and fitting habiliments of a woman whose days were spent in cooking, cleaning and mending.

The bald place on Jilson's head was plainly visible below the back of his hat, but in all the years of their married life he had never once failed to give his wife a birthday present—always something practical, of course—Elvira was a practical woman. Hopelessly plain and colorless, even in her youth, she had wasted little time or thought on personal adornment. She had ignored the very existence of pompadours, elbow sleeves and sheath skirts, and her black winter hat was of the crop of 1903.

And now he was going to give her a pink silk waist! She would surely think him crazy.

He hid his purchase in the haymow and groaned whenever he thought of the contemptuous look which would overspread the face of the sensible Elvira as soon as she saw it.

Suppose she should ask how much it cost! Four ninety-eight for a thing like that, and a mortgage still on the farm!

He grew so depressed thinking about it that his wife became worried over his health and almost forced him to take a dose of quinine.

With a feeling of dread, on Elvira's birthday Jilson produced his parcel, thrust it into his wife's hands and fled to the barn. It was half an hour before he could muster up sufficient courage to return.

"Might as well go back and have it out with her," he muttered doggedly, as he opened the back door.

Elvira was not visible. The breakfast dishes were still unwashed. Upon the floor by the stove lay the box and some tissue paper.

"I'll bet a dollar," sighed the miserable man, "that she's put the fool thing into the fire!"

"Well, Mahlon," said a voice from the bedroom, "I guess you think I ain't too old for fancy clothes yet! How'd you know so well what I wanted?"

Jilson turned and stared. Was this Elvira? She had slipped on the waist and loosened her tightly twisted hair about her face. There was a smile on her lips, a light in her eyes and a becoming flush on her cheeks—perhaps a reflection from the waist.

"Gosh!" he exclaimed. "I wouldn't have believed it, but the girl with the hair was right—any woman would!"—St. Louis Times.

About the House

IN many homes at this season of the year the air is full of commencement talk—the high school commencement—for nowadays the high school has annexed many of the time honored customs and ceremonies that have always been supposed to belong to the colleges and universities. So now in most high school communities, in the spring months, there is little thought of or talked of, but baccalaureate sermon day, the faculty reception, the senior banquet, class parties, final examinations, or the arrangements for class day—that day so fraught with pleasures to the members of all the classes.

The busy, anxious, seniors, and the important, bustling juniors work night and day while the critical sophmores and the excited freshmen share the

responsibilities and pleasures of the hour. The last few weeks of school are a hurry and a whirl, ending with the commencement exercises and the alumni banquet where the "new class" takes its place with those of former years, and toasts and speeches and general merry making close the evening.

And in all the worries and all the pleasures and all the responsibilities the fathers and mothers have their part. And right gladly and willingly do they do their share, and see too that the boys and girls have all that they can give them—whether it is time or money, or clothes or parties—or love or counsel—all these the parents give in full measure, and to the credit of the boys and girls—all that I know, at least, the parents bounties are worthily bestowed.

Perhaps for some of the school festivities some tested recipes for home made creams and ices may be useful.

Ice Cream.

One quart rich cream, 1 pint milk, ¾ cup of sugar, 1 tablespoon of vanilla and ¼ teaspoon of lemon. Heat a little of the milk and in it dissolve the sugar. When cool add to the rest of the ingredients and place in the freezer.

For freezing creams use 5 parts ice to one of salt.

To make strawberry cream add one box of crushed strawberries, sweetened to taste, and a little red fruit coloring dissolved in a little water, to the recipe for ice cream given above.

Frozen Custards.

One quart of milk, 1 cup sugar, and three eggs. Beat the eggs, add the sugar and milk and heat, but do not boil. Cool, add desired flavoring and freeze.

To make Pistachio cream add to this custard 1 cup of Pistachio nuts and 1 teaspoon of almond flavoring. A good substitute for the Pistachio nuts are pecans with a little green fruit coloring added.

Another variation may be made by adding to the plain custard a cup of English walnuts and dried or preserved figs chopped fine, or English walnuts, and candied cherries or seeded raisins chopped. Apricots or peaches may be added—in fact almost any fruit, remembering that if there is much acid in the fruit it must not be put with the custard until the custard is pretty well frozen.

Ices.

One pint of fruit juice, 1 pint water, 1 cup sugar, 1 tablespoon gelatine. If the fruit is very sweet add the juice of one lemon. Soak the gelatine in a little cold water. Put the water and sugar on the stove and let boil a moment, take off the stove and add the gelatine, strain and when cool add the fruit juice and freeze. To make a "sherbet" add to this ice mixture, when partly frozen the beaten whites of three eggs.

In freezing ices and sherbets use three parts of ice to one of salt.

Strawberry Punch.

Strawberries are plentiful in May and June, and strawberry punch is a delicious drink. Use berries that are fully ripe, and to every quart of fruit add a cup of cold water and cook until the berries are very soft. Strain through a cloth then measure the juice and put on the fire. For every two cups of fruit juice take one cup of sugar and when the juice has boiled for five minutes add the sugar and cook to a syrup. Strain through a cloth and if you want to save the syrup for future use bottle while still hot, but if you want to serve at once cool and to each cup of syrup add the juice of one lemon. Dilute with water to taste, and serve in small glasses with a tablespoon of cracked ice in each glass.—Elbepe.

PEELING ONIONS WITHOUT TEARS.

The work of skinning onions, which usually ends in tears, can be made a pleasure by pouring boiling water over them and covering a few minutes before peeling.—Woman's Home Companion for May.

If a mountain refuses to come to some men they put up a bluff of their own.

Cream Separators, all sizes, all prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

San Francisco Markets

SAN FRANCISCO, May 18, 1909.

Butter.

Butter is firm at a cent and a half advance over last week's quotations. Receipts aggregate 144,000 pounds per day.

Hay.

Somers & Co. say under date of May 15: No. 1 qualities of new volunteer oat and barley hay are being freely offered for delivery here, at from $14.00 to $16.00 per ton. As opposed to this holders of old hay are asking from $22.00 to $25.00 per ton. The result is that the new hay is finding ready sale and consumers are all taking hold of it with the greatest activity, while the old hay drags and sales can only be effected at reductions in price, and with the greatest effort. It is natural to suppose that the consumers here will exert every energy to obtain and use the new hay where there is a saving from $8.00 to $10.00 a ton on every ton which they feed.

Crop conditions are apparently good. The supply of hay will be probably about a normal crop, our advices indicating that in those section where the yield will be light, the increased acreage will more than compensate for the difference in the yield. It is absolutely impossble to predict market conditions and prices, other than that the generous supplies of new hay which will be increasing every day will undoubtedly cause the market to assume a rational condition, and hay will sell as it has normally in previous years. In many ways this season is an unusual one. Looking over our files, we notice that for the last four years the first car of new hay arrived from May 16th to June 6th. This is now only the 15th of May, and yet we have had on our market several hundred tons of new crop, and advices are of many hundred tons on the move in toward this city. In view of the fact that this is rather a late season, these early arrivals in such quantity show clearly the unusual activity in those sections where hay is maturing early, and the efforts that are being made to take advantage of the shortage in the old crop.

Alfalfa has practically come to a standstill, as there is no demand for the first cutting and the second and third cutting are not yet ready for the market. It will probably be some weeks yet before the market is firmly established. Straw is in good demand and sells readily at quotations. Quite a little demand has developed lately, and this article is doing better.

Owing to irregular arrivals and unsetled conditions of the market on new hay, we quote the general range of prices on today's market on the old crop only as follows, viz:

Choice wheat hay	22.00@25.00
No 1 wheat or wheat & oat	20.00@23.00
No 2 wheat or wheat & oat	17.00@20.00
Choice tame oat	20.00@23.00

Citrus Market

LOS ANGELES, May 19th, 1909.

The tone of the orange market is somewhat more favorable, and while the prices may not be considered higher, there is a feeling prevailing that the worst of the season has passed. The demand is better and lower grade fruit does not remain unsold so long as formerly. The further in the season we go the more evident it becomes that the crop this season will be a record breaker. There are yet to go twelve hundred or more cars of seedlings, sweets, Mikes, bloods, and other varieties. The Valencia crop will probably be double that of last year. These have not been put on the market yet excepting in small quantities where the growers have been compelled to lighten the trees so that they could carry the coming crop. It is possible that the Valencias may not command as good a price as last year.

Lemons are in rather a bad way owing to weather conditions. The only thing which will lift them out of the hole is good warm weather which cannot be depended upon in the East until the warmer days of June.

Shipments.

Total shipments to date this season since November first 25,072 cars of which 21,927 were oranges, and 3,145 lemons. Total at same date last season, 21,755 of which 19.280 were oranges and 2,475 lemons.

NEW YORK, May 17.—Forty-nine cars oranges and two cars lemons sold. Market steady on good stock, about firm on poor grades. Steady on lemons. Weather cool, cloudy.

The thing that goes the farthest
Toward making life worth while,
That's worth the most that costs the least,
Is just a pleasant smile.
'Tis full of worth and goodness, too,
With manly kindness blent,
'Tis worth a million dollars,
And it doesn't cost a cent.
—American Grocer.

THINNING FRUIT.

(Continued from Page 590.)

of apples. The fruit is generally picked on the installment plan, and it is possible to mature a large crop of fancy fruit; and fruit that is small may be left until it reaches the decided size. Pears running from 135 to 150 to the box are considered ideal size, and pears for such a pack must measure from two and one-fourth to two and three-fourths inches in diameter. Pears larger than three inches are really not as desirable for the fancy fruit trade as those of smaller size. The fruit stands like a pear that can be sold at a profit, two for five cents, and there is no profit to be made in selling the larger ones for that price, and they are not large enough to sell for five cents each.

Thinning Peaches.

In growing peaches much of the thinning is done with the prunning shears during the pruning season, but additional hand-thinning is absolutely necessary. A good grade of peaches should run less than 90 to the box, and we may say it seldom pays to ship smaller fruit. A size that will pack less than 80 to the box is desirable. The young peach orchard that has been properly pruned will do well to average a box of fruit to the tree during its fourth season's growth, and the yield should increase at the rate of about two boxes per tree per year. Unless the trees have been exceptionally well pruned and cared for, they will rarely more than hold their own after the eleventh or twelfth year. The one object of thinning, as practiced with the stone fruits, is to produce better fruit. The thinning should be done before the foliage gets too heavy and before the pits begin to harden. By carefully thinning a few trees and estimating the number of fruits left, one can soon form an ideal to work by. The pruning shears may be used as a help in thinning, and fruiting wood not necessarily needed may be removed entirely.—O. B. Whipple of Colorado Agricultural College.

Intense Cultural Methods Pay.

Mr. A. R. Wilfley of Denver last week paid $35,000 for the Wilson & Heltman grove of 11 acres located at Whittier. This is the "top notch" so far as price for orange property is concerned. The grove is set solid to 16 year old Valencia trees, no buildings. The crop now on trees is estimated at 8,000 field boxes. This grove has been brought to its present high productive state by good care and the liberal use of fertilizer, twenty pounds per tree, of the A. C. W. Special Mixture, applied in two ten pound applications, winter and summer.

Mr. Wilfley purchased the grove as an investment and is continuing the methods of the former owners in fertilization, irrigation, etc.

The price paid for this grove points out forcibly that a grove that has good natural conditions together with proper help that will produce 7,000 to 8,000 boxes is worth a good deal more than one that can only produce 2500 or 3000 boxes. In other words the best is the cheapest, as the fixed expenses are the same in both cases.

One other grove in Southern California, Mr. Wilfley made an offer to purchase was Collins Bros., "El Dorado" grove at Charter Oak. The offer was refused as the property is not for sale. This is a nine year old grove of Valencias, crop now on the trees estimated at 7,000 boxes.

This grove has been a wonderful producer. At eight years it made 5,000 boxes, at six years 4,221. The grove has had two good dressings of manure in nine years and A. C. W. fertilizer is applied at present, at the rate of twenty pounds per tree of a special mix to order of the owners. The trees have had fertilizer twice a year from time of planting.

OPPOSED TO SLANG.

Donald had been to Sunday school, and on coming home was asked what he had learned. The lesson was the story of Joseph, and the small learner was evidently very full of his subject.

"Oh," he said, "it was about a boy, and his brothers took him and put him in a hole in the ground; and then they killed another boy, and took the first boys coat and dipped it in the blood of this boy and—"

"Oh, no, Donald, not another boy!" his sister interrupted, horrified. But Donald stood his ground.

"It was, too," he insisted. Then he added, "The teacher said 'kid,' but I don't use words like that."—Woman's Home Companion for May.

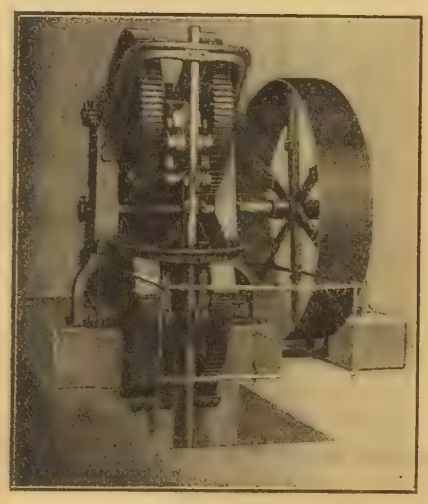
The Smooth Running, Noiseless Pomona Deep Well Pump



It is thirty to fifty per cent more efficient than any centrifugal pump ever made. No high speed bearings to cut out. All breakages and rod troubles eliminated.

This is the only pump you can afford to buy if you consider your own interests. Hundreds of satisfied users testify to this.

Used by the best water companies who know what a good pump is.

Send for a catalog or what is better come to POMONA and let us show you some of these plants in operation.

POMONA MANUFACTURING CO.
POMONA, CALIFORNIA

THE
Latest Deep Well Turbine Pump

Guaranteed to deliver from 100 gallons per minute upwards, depending on the diameter and capacity of well, from a depth of 50 to 300 feet below the surface. Can be either belt driven or direct connected to electric motor as occasion requires.

Write for Catalogue 46B.

A deep well pump that has no valves or plungers to wear or get out of order, no gears, consequently no noise or breaking of teeth.

Compact, durable, always primed and ready to operate, constant flow, hence increased capacity of well.

This type of pump is fast taking the place of Vertical Steam. Deep well Plunger and Propeller Pumps.

"The Painted Woods Enshadowed or Agleam"

Just to lie quietly and half a-dream,
Without a thought or care;
To listen drowsily ;
To view from half-shut eyes
The painted wood enshadowed or agleam.
So lies a babe against the bosom fair
That nourishes—now lists the lullabies
With lowered lids, now slowly doth upraise
Its long still wondering gaze
Unto the heaven of its mother's eyes.

And now again—O softly breathe !—I see
Across yon leafy path that winds the wood
A shy brown mother-quail come forth to lead
Her pretty brood.
Alas ! the alien meets her startled ken,
And lo, in an eye's twinkling every one
Has disappeared, has gone,
Has turned a crumpled leaf—all's still again.
Aha, my woodland babes, I see you feed
(I know the lore of fairies) on fern-seed.

—Marion Cummings Stanley in Out West Magazine.

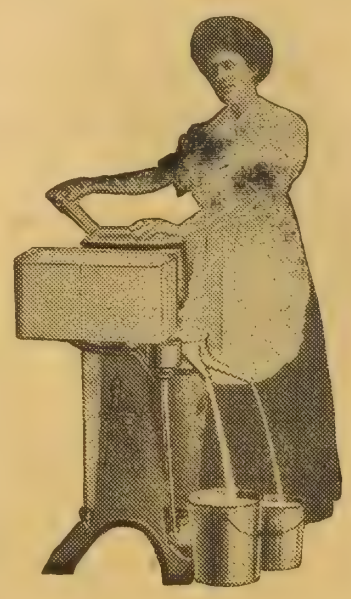
Sticks in Your Eye

THE BEAUTY and convenience of Sharples Tubular Cream Separators stick in your eye. You simply can't forget them.

The supply can is so steady and easy to fill. It need never be moved to take the Tubular apart. All separators, except the Sharples, have cans set right above the bowls---such cans must be lifted off before the machine can be taken apart, which is doubly unhandy if the can happens to be full.

The few, simple running parts are all enclosed in a dust proof case in the head of the Tubular. They are entirely self oiling, needing only a spoonful of oil poured right into the gear case once a week. The gear case cap lifts off without unfastening anything. This makes Tubulars very neat.

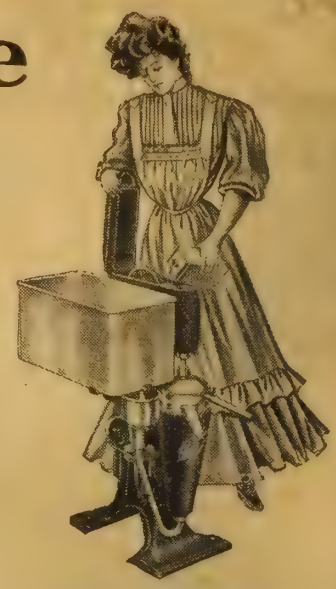
The light Tubular bowl, hung from a single frictionless ball bearing, and driven by self oiling gears, makes Tubulars so light running that the medium sizes can be turned by one who is seated.



The top of the supply can, on the largest dairy Tubular, is only 3 feet 3 inches above the floor. Observe the plumb bob on the back of this Tubular "A" for quickly leveling the machine and keeping it level—another exclusive Tubular advantage.

Your wife will appreciate that, and also the light, quickly washed dairy Tubular bowl which contains one tiny, instantly removable piece very much like a napkin ring in shape and size.

Tubulars run remarkably easy because they are **built remarkably well and in the only right way.** They skim twice as clean because **they develop twice as much skimming force.**



To oil the Tubular, simply pour a spoonful of oil into the gear case once a week. The gear wheels throw this over themselves, and the ball bearing supporting the bowl.

Avoid wishing you **had** bought a Tubular by **buying** a Tubular. Built in the world's greatest separator factory. 1908 sales way ahead of 1907—out of sight of most, if not all, competitors combined. Our handsome 1909 Tubular "A" is making 1909 better still. Write for catalog No. 260.

Hay Presses

Fourteen years ago we began selling the **Eagle Hay Press.** During this time we have sold over 600 of these presses, and as near as we can learn there is not a second hand Eagle Press for sale today. This, we believe, is the best hay press record of any make sold on the coast. The press, as made today, is, without a doubt, the strongest, best and longest lived press on the market. The question is: Will it pay you to experiment when you know that you can get a tried, and not found wanting, press.

A word in favor of the **Columbia Ann Arbor Belt Power Hay Press:** Three years ago we started to sell these power presses. We now have in the field, and orders written up which will go into the field within the next ten days, 34 of these presses. Last year one of our 17 x 22 steel frame power presses balled 3800 tons of hay, and averaged a little over 53 tons per day. This is a record that we can assure you no other press has ever made in this territory, or anything near it. If you are a friend to yourself you will thoroughly investigate the power hay presses before placing your order for a press with anyone. We court the closest investigation, as we have the conclusive evidence that we have what you are seeking. You will find us at 110-112 North Los Angeles St.

A Review of American Country Life

Written by Judge Peter J. Shields of Sacramento and Read at the Last State Fruit Growers Convention

LIFE in the open country, under the clear sky and in the midst of green fields, has never failed to excite the praise and move the fancy of the world. There industry does not hum, but is full and abundant; life is peaceful, but of a measureless range; and the silent forces of nature stir only man's best impulses. Such a life requires no praise or appreciation.

No Defense Needed.

Nor shall we here attempt any praise or defense of farm life, nor of the men who live it. With outdoor conditions has ever gone a type of manhood that was clean in its morals, sturdy in its courage, useful in its industry and loyal in its patriotism. Country life has given to America its ideals, and our institutions are peculiarly its product. Its freedom and independence and repose are everywhere expressed in our Nation's aim and purpose. It has all of its strength and reserve and courage. While we remain a Republic, dedicated to justice and equality, we must remember from whence our strength and power came; and we must foster our country life that it may supply the influences which will keep our Nation ever vigorous and young.

But, mindful of these conditions, we are mindful too that this life has its weaknesses as well as its strength, and our purpose today is not to rhapsodize or appreciate its better side, but to study its conditions as they are, to endeavor to determine its value and to indicate, if we can, how its condition, good as it is, can be made better, and its usefulness, great as it is, may be enlarged. On its weaker side it may be said of farm life that it lacks social advantages and educational opportunities. The life is too often solitary and isolated, and the range of its activities narrow and circumscribed. Too much of its labor is mere drudgery, and it lacks the alluring prospect of easy profits or large wealth; its earnings are too often small; its work hard, and its hours of labor long and monotonous, lacking stimulation or enthusiasm. Many elements of the home life are meagre, the farm women lack companionship; their work is hard, and routine uninteresting. A combination of these influences tends towards a general atmosphere of repression. Over wide areas these conditions happily do not prevail, and everywhere they are becoming outgrown. When we were going through that phase of our country life in which these conditions were most prevalent, our cities began to grow and our youth in a steady stream left the, to them, unatractive farms for the pleasures and opportunity of the apparently larger life. Under the influence of this desertion rural conditions further degenerated, farm life languished and the cities grew apace. This disproportion, this condition of social and industrial unbalance excited first interest and then alarm. Our people began to study the consequences to the individual and the state of rural decay, we began to see country life with a better understanding and consequently a new appreciation. We began to see that the country produced a different although not necessarily a better man than the cities, a man indispensable to our social soundness. The full industry of the country, its beauty and its sweetness, its dignity and its peace were reflected in the character and personality of the man who grew up there, and gave him a depth and earnestness and sincerity which made him big and effective.

Moral and Creative.

We saw that the country was free from those temptations which beset the path of the city youth, and that a simple honesty was characterisic of it. Its industries were moral and creative, its wealth was cleanly realized from the very elements by the application of honest toil. With a new force we saw that its products fed the industries of the cities and created the commerce of the Nation. With the continued growth of our cities their social problems began to develop. Crime increased, and the overcrowded tenement districts and large numbers of helpless poor beban to appear. The question of what to do with our great mass of dependent children began to press for solution, and divorces so multiplied as to become a national scandal. And we then observed that these conditions did not arise in rural communities, that its wholesome industrial conditions forbade them, that they were the sole product of the cities, and that the country's only part in their existence was to pay the price of their correction and support. We came early, too, to realize the political value of a country citizenship. It early appeared that it cast a steady and conservative vote. Without passion or hysteria, having peculiarly high patriotic and moral ideas, it moves to the solution of governmental problems slowly but sternly. We saw that it was the nation's hostage against the forces of revolution and unrest.

These considerations newly realized or newly learned gave to country life an enlarged appreciation and a new eminence, and lay at the base of a revived national desire and purpose to foster it as the very foundation of the nation. As a result of these considerations the question is constantly, though crudely, asked as to the relative advantages of the two types of life, as to which produced the better man. This admits of endless discussion, but one without profit. It is readily apparent that both conditions are indispensable to a large national existence and symmetrical social growth. That a man should follow that life in which he can find the most happiness and do the best work is self-evident, and if that be a city life or a country life, that is for him the one to follow. There is enough in each to furnish the materials of a useful and happy life, of distinction and greatness. The one undisputed fact in their comparison is that success in either is a question of interpretation, of seeing large. Our great cities are rich in stimulation for those who can feel it. If the city boy once knows the thrill of the high life about him, he may pursue its best purposes to distinction. If the country boy once catches the inspiration of his noble surroundings; if he once sees the size of the factors with which he is dealing, the big thought makes him a big man, and masterfully and with an enthusiasm which ennobles his labors, his life tends naturally to fine achievement.

Manifestly the thing to do is to cease comparing the two and go about controlling the forces back of each that the youth of both shall hear the right call and that their progression be directed towards the high places. Each at its best is good enough and the nation is more concerned in knowing that each is lived to its best than that either is the more meritorious. The general welfare is served when governmental and social forces are so formed that city and country life, each in its own field, shall be perfected and when both working together shall round out a sound and useful society.

A Better Day.

Growing out of this new national purpose to strengthen agricultural life many influences conspired to effect its betterment. The city man regarded his country brother with a new respect; the country man felt a new pride in his calling. Having more friends, in its prosperity many strong influences combined to aid it. Commerce ramified and extended and the farmer learned business from the city merchant. Transportation facilities multiplied and gave the farmer new and better markets and enlarged the range of his life. Agriculture was given a place in the President's Cabinet, and the Department in recent years has been doing a great good to the industry which it was created to serve. Agricultural newspapers have everywhere increased in number and improved in quality until they have become an invaluable aid in improving farming conditions. And then the improvement and multiplication of agricultural schools and colleges has come to do all that can be done to prepare the country man to live a country life.

The Commission.

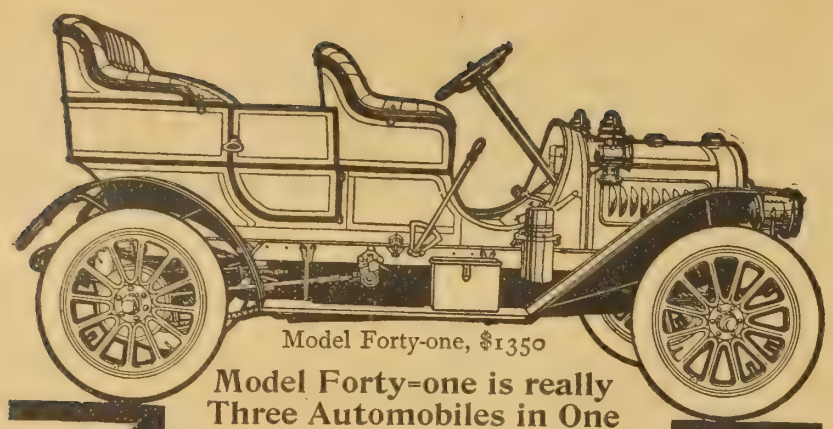
The latest agency which has offered itself to the out-of-door man, the latest evidence of the nation's concern for the farmer, was the appointment by the President of the Country Life Commission which visited us.

To determine how this commission can be of help to country life, we have only to recall the unfavorable features of that life and inquire how they may be remedied. These disadvantages are pretty generally set forth in the letter of the President and the correspondence of the commission. Happily they have little reference to California conditions. Among them is the isolation and lonesomeness of farm life. This the Commission may point out as it has been pointed out countless times before, but it cannot recommend legislation for its correction. Nor can it favor laws abolishing unintelligent methods, long hours and heavy, unprofitable and uninteresting work. These are personal and industrial conditions, beyond the reach of legislation. Health restrictions may be legally and practically enacted to improve city conditions, but if the rural sanitation is bad, laws promise little more remedy than mere suggestion. The President suggests a study of the condition of the rural schools. They are now good, and substantially meet the demands made upon them. Of what avail to improve a course of study if the school is open too short a time, or if the children, at work on the farm, do not attend it? Of what use to commend a more capable teacher if the people cannot afford to pay the price of his employment?

Good Roads A Factor.

Our people are now building better roads as fast as they feel the need of them, appreciate the loss they sustain through the use of poor ones.

(Continued on Page 612.)



Model Forty-one, $1350

Model Forty-one is really Three Automobiles in One

This Rambler has been built to do the **real** work required of an automobile on the farm. It is pictured above as a five-passenger touring car. Taking the tonneau off leaves a roomy platform that will carry anything that a small wagon will carry—or a torpedo deck can be substituted, making a handsome two passenger roadster.

Rambler

It is the perfection of a type designed in the first place to stand unusual strains and travel country roads. Its unit power plant and all working parts are completely enclosed for protection against mud, water or sand. It has high clearance (15¾ inch) between the axle and the ground. It has large wheels and big tires, full elliptic springs, and brakes strong enough for any possible emergency.

The Car of Steady Service

Write today for our farm folder No **156** You will be delighted with the practical information it contains. It will prove to you by letters from owners and actual photographs how practical the Rambler is for the farm. It is free, so write before you forget.

With the Citrus Growers

FRUIT ACREAGE.

FROM report of the State Board of Equalization the Riverside Press makes up the following summary of the fruit acreage of the state. The acreage in oranges figures out 113,500, with 17,000 in lemons. The leading citrus growing counties with the acreage in each are as follows:

County—	Oranges	Lemons.
San Bernardino	36,500	2,600
Los Angeles	24,835	5,115
Riverside	21,400	1,400
Tulare	12,500	800
Orange	10,000	1,300
Butte	2,275	....
San Diego	700	2,100
Ventura	1,300	1,250
Santa Barbara	....	1,600
Fresno	890	240
Yuba	750	....
Placer	580	....
Sacramento	560	....
San Luis Obispo	90	300
Stanislaus	300	....
Tehama	150	....
Sonoma	110	....
Colusa	100	....
Kern	80	....
Merced	80	....
Solano	80	....

The acreage in peaches figures 72,455. The leading counties in acreage of this fruit are as follows:

Placer	15,760
Tehama	7,700
Santa Clara	6,320
Tulare	5,560
Solano	3,750
Butte	2,450
Kings	2,345
San Joaquin	2,200
Los Angeles	2,200

In French prunes the total acreage is 71,100. The leading counties are as follows:

Santa Clara	43,800
Sonoma	6,000
Solano	3,500
Tulare	2,250
Alameda	1,700
Santa Clara	950
Eldorado	880
Kern	460

The acreage in apricots is given as 22,600, and the leading counties are as follows:

Santa Clara	5,550
Orange	2,000
Los Angeles	1,750
Alameda	1,130
Fresno	950
Ventura	900

The acreage in apples is given as 20,400 and the leading counties are as follows:

Santa Clara	7,000
Sonoma	2,800
Los Angeles	1,450
Monterey	760
Alameda	560
Napa	550

It will occasion some surprise to find this acreage in apples is quoted from Los Angeles county, but the orchards must have been actually returned to the county assessor. San Diego county has 260 acres in apples and San Bernardino 180.

There are 10,700 acres in plums, other than prunes, the leading counties being as follows:

Santa Clara	2,950
Placer	2,860
Napa	1,600
Solano	1,100
Los Angeles	460

There are 5,820 acres reported in cherries. The leading counties being as follows:

Santa Clara	1,600
Alameda	960
Sonoma	600
Solano	405
San Joaquin	355
Napa	330

There are 3,900 acres reported in figs, Fresno county being credited with 700.

The acreage in olives is reported 11,800, the leading counties being as follows:

Los Angeles	3,020
Sonoma	1,000
Fresno	800
Butte	700
Riverside	685

The acreage in almonds is surprisingly large, being reported as 12,580. The leading counties are:

Contra Costa	2,250
Los Angeles	1,400
San Joaquin	1,400
Alameda	1,200
Solano	1,000
Stanislaus	650

The acreage in walnuts figures out 7,000, and this acreage is practically all in Southern California, as the following figures will show:

Los Angeles	2,660
Orange	2,220
Ventura	1,875
Santa Barbara	520
San Luis Obispo	450

IRRIGATION AGAIN.

The answers which were received to the letter on Irrigation have caused much favorable comment and are being most favorably received by Cultivator readers. There was one answer received too late for insertion in the former issue which contained the bulk of the article. We now give it because it has some points of value. It was written by

G. W. Earl, Gilroy.

1. I prefer furrow system.

2. Shallow furrow but deep enough to confine the water in the furrow.

3. I have not used subsoiler.

4. Soil should be saturated down to moist soil. In gravel soil water should run an hour and in clay all day. My soil grades from almost pure clay to gravel.

5 and 6. I run the main ditch through the center of ten acres and turn all the water in a furrow that it will hold until the water reaches the end and then place a piece of pipe in the bank of the ditch, that will supply a sufficient quantity of water to reach the end of the furrow. If there is too much water an obstruction can be placed in the pipe. Old pipe of any kind can be cut into 18 to 24 inch lengths. For short furrows old garden hose can be cut into lengths with a hatchet.

7. Connect the lower end of the furrows to prevent overflow.

8. Cultivate as soon as the ground is dry enough and follow with acme harrow.

9. Whenever my ground is 'smoothed' it is harrowed immediately afterwards.

10. I do not cultivate till another irrigation makes it necessary.

11. Irrigate twice, two weeks apart.

At the present time I am laying 400 feet of sewer pipe to convey water. Will report the success of my experiment when the line is used. The cost is comparatively small if the pipe is bought right.

* * *

We trust that Mr. Earl will give us full particulars of the results of his new pipe line. Has it saved sufficient water to cover the additional cost? Is it more efficient? These, and a number of other questions, will, if answered, give us information of value.

COUNTRY LIFE.

(Continued from Page 611.)

and as fast as they can afford to pay for them. Laws in relation to good roads under present conditions would

be largely temporizing, while the conditions which resulted in bad roads continued. We must change the condition. Our present mail facilities reasonably meet the demands of our farm people. In the main they are satisfactorily served with such mail as they have the judgment or taste to select, the means to pay for and the time to read. It is suggseted that the rural people should meet more frequently and co-operate more fully to effect the welfare of their industries. This, if only the repetition of an old, is surely a wise, recommendation. But if to do so the farmer has to travel a long distance over a poor road, at the end of a long day's toil and on the eve of another, it is an obstacle which neither argument nor law will remove. He has been misled and injured by such means until he has grown suspicious; he has not been trained in such activities and he does not make them interesting or profitable. And, so, afraid, bored and without hope of advantage, he maintains his seclusion. It would be futile to point out the advantages of such meetings while these conditions continue. And the scarcity and unreliability and un-intelligence of farm labor is beyond the reach of law to remedy; it is an evolution which can only be remedied by a correction of the forces which produce it.

Above Laws.

I think it clear that rural conditions cannot be corrected or even improved by laws directed immediately at its defects; we must go deeper and correct the causes, and this remedy cannot be applied by some one else for the farmer; paternal law in his behalf would not only fail of beneficial results, but would work an injury and be resented by a man who is able to stand alone. The country man needs no legislation peculiar to himself; his wants are met in that respect when the people generally are wisely and justly governed. His interests are best served by those measures which are of general application and best serve the interests of the whole people. Given good general criminal, financial and economic laws, and his condition demands no more; it does not permit of any other. To a greater degree than any other man he can work out his own progress. Firmly fixed upon the soil, controlling the very forces of nature and bending them to his service, he is his own master and is able to mould his own destiny.

The Remedy.

But this does not acknowledge the existence of numerous and grave limitations to rural life and despair of their correction. For there is a remedy, and it is easy of application and entirely adequate. It is as broad as the evils sought to be corrected, applicable to all conditions and capable of accompanying agricultural life through all of its developments, and keeping it sound and making it supreme. And that remedy is Education! Not general education, although that would be most helpful. Not educating the farmer, the out-door man, to be a merchant, a journalist, or a physician; but teaching him to be a farmer; training him for the work he is to do, for the life he is to lead.

This will help the country in the only substantial and permanent way in which it can be helped, and start it on the road to an endless development. Agricultural education will not only refine and cultivate the country man; it will stimulate and energize his mind. Trained to know his soil, his seed and his animals, he will use only the best and those to best advantages. Growing only the best and the most of it, combined with business methods, he will make more money and consequently have to work less hours. Leisure and wealth will give him time for new ideas and the means to realize them. He will add beauties to his farm and refinements to his home. He will farm more on fewer acres. His labor, to what is now regarded as its humblest detail, will become intelligent and enthusiastic. Cultivation will become intensive, farms will be subdivided and population will increase.

Upon these conditions the farm meetings and farm organizations will follow naturally and be made to realize their fullest measure of social betterment and business advantage. The intelligent and prosperous farmer will see the advantages of good roads and will build them. He will demand better schools which his children will have time to attend, and he will provide and develop them for himself. He will read more and better publications; he will have an increased correspondence; he will need better mail service, and he will have the power and intelligence to get it. To this well settled and prosperous country transportation facilities will come and the whole life will go up.

Country life will become attractive, and its labor problem will be settled. Better men will be drawn to it ;they will be trained by it, and its discipline will make them efficient and dependable. There is no phase of country life to which education of this character does not apply and which it does not improve. We should therefore urge upon every moral reformer, upon every humanitarian, upon every statesman and political idealist, that they advise and demand that immediate steps be taken to give to this country an enlarged and adequate system of agricultural education.

Let us in California strengthen our College of Agriculture and make it fit our necessities. With particular emphasis let us go about the work of building up and supporting the School of Agriculture at Davis, and making its management practical and vigorous. Knowing the value of a strong rural population, of its necessity as a source of happiness, of wealth and strength, blind to consequences, we have been training our city man for all of his activities and the country man for none of his. We have been teaching men to practice law, to conduct banks, to lay bricks; but we have asked this country man to grope amidst nature's mysteries without a ray of light. If our cities grew great under this treatment while the country fell away, let us not be blind to the cause, nor hesitate now at its correction. This will require work and will take time, but it will be worth while.

Looking into the future, and seeing country life as it will develop under training, I see a field into which science has gathered all that is good and from which progress has banished all that is ill. I see farm homes filled with the fruits of wealth and culture and moral purpose, set amidst the dignity and sweetness of nature; the kind of homes which shelter strong, clean and effective men, and which nurture a youth fit for all the trials of life, equipped for effective industry and the kind of citizenship which this great democracy demands.

All About the Orange and Lemon

Is told in our new book on Citrus Culture, embracing every phase of the subject from the seedling plant to the final disposition of the fruit in the Eastern market. The largest and best book on the subject ever printed —60,000 words, 100 illustrations. You will want a copy, which we will send you for the small sum of 25 cents. Remember we are the largest growers of orange and lemon trees in the world.

SEED

Melon Seed Morris & Snow's Select Strains of Chilian, Red Seeded, Yellow Bellied and White Seeded. All of extra select stock. Some of our customers have made more money from one acre of these than from four acres of common stock as handled by others.

Casabas also. Improved Hybrid, Summer and Winter, all from select stock. Get our prices and make a trial. We also have a select strain of **Gautier's Pineapple.** All selected from perfect melons and not from leavings, as is customary among many. **Vegetable and Flower Seed** of select strains. Our "High Quality," "Full of Life" Seeds are winning for us wherever tried.

Eucalyptus All the Leading Varieties in seed @ 15c per package, (Six of the leading varieties, E. Rostrata, E. Leucoxylon, E. Rudis, E. Globulus, E. Corynocalyx, and E. Tereticornis for 50c, with cultural directions). 500,000 Plants, all varieties. State your wants and get prices.

Deciduous Fruit Culture

By J. W. Mills

THE SCIENCE OF IRRIGATION.

ASSUMING that you have the ground laid out just right, the subsoil wet enough and the ground planted with fruit trees well cultivated, everything now looks quite fine. And it probably is far better than it could be under any rainfall. But it is not as good as it should be. You cannot see it, for your eye is not practiced like that of a buyer of fruit on the tree. Even he may not know what the matter is, though he may quickly see that the fruit is deficient in flavor, keeping qualities, perhaps, and in the percentage of the first grade, which is the first thing he looks after. Perhaps only an experienced grower from some of the most successful fruit-growing districts could tell you, and he could not do it at a glance. Probably he would not offer any criticism unless pressed for an opinion, when he would probably say:

"Well, down our way we get better fruit and more of it by irrigating with furrows than we can by flooding."

"How so?" you ask. "Flooding puts in water enough, doesn't it?"

"Oh, yes, but we quit it long ago and are making more money out of less water."

"But it doesn't interfere with good cultivation," you suggest.

"Well, no, I suppose not. But there's some difference we can't account for exactly, something besides keeping the water away from the trunk of the tree. But we do know the difference in the cash box. We thought we were doing well enough before we changed. But it is certain that we are doing much better. You might not be able to point out the difference when in the orchard, but there is no appeal from the returns."

Such talk as this has within 20 years changed the irrigation of whole sections in the West, and I do not know of a single case in which there has been a return to the old method, or that anyone has any fault to find with the new; though there are many places where a very porous soil would disappoint one who could not get large enough heads of water.

On tight soils it may be used with very small heads.

Suppose you have a square 10 acres in orchard. It will be 220 yards on each side and you want to put into the soil an equivalent of three inches (rain measure). As a second foot equals an inch an hour per acre (rain measure), it will need 30 hours to make three inches of rain on the whole. This would be far too slow for flooding, even in 25-foot checks. But if you can get a good second foot for 30 hours you can do better work with small furrows with less help, and if you can get it 60 hours you can do still better on many soils with only half the head, or half a foot.

It may seem quite absurd to divide such a stream into 220 little ribbons of water, running only a little over a gallon a minute and spread a yard apart and expect them to get anywhere. Yet that is exactly what is done in many a fine orchard and to do it all you need is patience and to remember that it is the greatest step in advance that was ever taken in horticulture and one that has been so thoroughly tested for 30 years that it will never go backwards.

You naturally remark that your soil will never hold up such a little stream to run 220 yards across ten acres. That is exactly where you deceive yourself. It probably will if you give it time enough. Suppose you try it. Make a small furrow about three inches deep with the corner of the hoe, turn in such a stream and sit down and watch it. Or, better yet, go down town or go to bed. If it will cross the ten acres in ten hours, with the land well graded to a uniform slope, with the furrows evenly made, and no gopher holes to engulf it, it is all you should expect. If it will do it in 15 hours it is fine, and if it takes 24 it is good enough, provided you can have the stream one or two days longer.

The result of such work, if well done, is that of a long, slow rain, and is superior to almost any form of flooding. This is especially the case in orchards, where the cutting of one check to rush its contents into the next one has the effect of a heavy dashing shower. And even the finest flooding that can be done for all kinds of garden work is not equal to a long, fine rain. Flooding for economy or to close the air space at the surface is quite another matter, just as much as flooding to drown gophers. On land where you do not have to seal the surface the difference is plain if you watch it long enough.

But there are some soils where the water will drop too straight downward and not soak sideways far enough, and others where the soaking is provokingly uneven. On one place I had, corn would get plenty of water two feet from the furrow. In a few hills farther on it would wilt at the same distance, and in some places the ground would be dry six inches from the furrow. The ground was rich and easily worked when wet, and merely seemed to have tight spots through it. This ground raised fine fruit with any form of irrigation, but was a nuisance for gardening because for that you don't want streams running two or three days. Half a day should be enough with shorter furrows and sometimes larger streams. And if corn, potatoes and similar stuff will not flourish under a three hours' run of streams of about nine gallons a minute—one-fifth of a second-foot—the land will probably be better for something else unless you have plenty of water to waste. Even then it doesn't follow that it should be all used because you have it. If cold, it may be very bad, for garden stuff generally needs water oftener than orchards and chilling the ground too often may cause more loss of profit.

The main difficulty with water dropping downward in some soils instead of soaking sideways is in too even texture, like shot of one size. In very gravelly and sandy soil it will soak to the sides perfectly if there is enough fine sand and fine clay or dust mixed with it. This is the case with most all upland soils. With furrows three feet apart the moisture will meet two feet below in half a day, and in a day will meet at six inches below on some soils. In winter it will often be visible at the surface, but in hot weather especially with a strong sun in dry air it will rarely show at the surface, even at daylight.

On my ranch I can wet to the cen-

(Continued on Page 619.)

Bees and Their Care

WAX SECRETION.

THERE are times when bees secrete more wax than others—during good honey-flow, for instance, or in the case of booming colonies in the spring that have their hives full of honey from the previous year and are required to handle it, making room for the queen, etc. At such times I have found comb-building cheaper than otherwise, and have often taken advantage of that fact in making the bees draw out combs for future use.

At the very beginning of the honey-flow, or even before, every colony in our yards is supplied with a shallow super of drawn combs to catch the first honey that comes in scatteringly, and in too small quantities to cause comb-building to any great extent. If we did not do this we should lose some honey at this time. A little later a comb-honey super with full sheets of foundation is added under the one containing the drawn combs. By this time the bees are secreting wax plentifully, which is shown by the whitening of the combs in the first super, and comb-building is begun on this foundation at a rapid rate, wax secretion being on the increase as the flow advances.

For years we supplied all supers given after the first two just mentioned, with only half-sheets of foundation because we thought the additional foundation was not needed, since the bees were secreting wax involuntarily, and that the extra wax used in full sheets would, therefore, be a loss. Last year, however, we had an experience that seemed to upset these conclusions. We were putting on supers with full sheets of foundation all the way through, mainly because we had it; but, on account of delay in a shipment, we ran short, and only half-sheets of foundation were put in 50 supers or more. As there was a good honey-flow still on, and the bees were working well in their third supers, secreting wax at a rapid rate, we thought it would not make any difference. But it did make a difference; for in six days' time all the supers with full sheets of foundation were fully drawn out, and, upon careful estimation, they averaged from 20 to 25 pounds of honey, while those with only third and half sheets averaged only about 10 to 15 pounds. This taught us a lesson; and hereafter we shall use full sheets under all conditions.

It costs about 20 cents per super for full sheets; and by putting in half-sheets, we saved 10 cents per super. In six days' time the difference between the two in honey stored was fully ten pounds in favor of the full-sheet supers. This was comb honey, and averaged 12 cents per pound, making $1.20 per super, or a loss of $1.10 above the 10 cents saved on foundation. The colonies that fell behind on this account remained behind the rest of the season. The test was a very conclusive one, as the two yards were among the best we had, the colonies unusually even in strength and ability, and the flow an extra good one of long duration. With a poorer flow the results might have been worse. The supers were hastily put on at random, just as taken from the wagon, without paying attention to which had full sheets or only starters.—Gleanings in Bee Culture.

THE BUSY BEE.

Where extracted honey is produced in large quantities, the nicest thing I have ever seen for straining same is the strainer bucket.

The bottom and sides of the bucket, which, by the way, is the size and shape of the ordinary milking pail, are made of a fine mesh wire, and the honey, as fast as it runs from the extractor, goes through the pail, and from there into the honey vats.

This strainer is far superior to cheesecloth, as the little particles of wax, pollen, dirt, etc., are all caught, and it is more quickly and thoroughly cleaned than cloth.

Another good strainer is made by taking an ordinary tin pail and cutting a large hole in the center of the bottom, allowing not more than an inch of the bottom to remain all around; have some fine brass or copper wire screen soldered in the bottom, and the trick is done.—Orff's.

Have your own bees. Did you ever think what these visiting strange bees are after when they hover around the fruit blossoms, day after day? They are feasting upon nectar belonging to you. Of course they leave some payment by more completely pollenizing the blossoms. Study over this bee proposition, and another season supply bees of your own, therefore getting benefit of the twofold profit.

Preventing the spread of foul brood should be the object of every person interested in the bee-keeping industry; and each one can do some particular thing that will help.

Better packages for our next honey crop should be considered by every bee-keeper who ships honey. We do not care to have the railroads raise the freight rates.

PALMS

We have 500 Washingtonia Gracilis, now in 6 inch pots, that have been exceptionally well grown from seed from one tree in Mexico—pronounced by thecollector as the finest specimen he had ever seen. Experienced planters need not be told of the value of palms grown in pots. No risk in transplanting. For price, address

The CREAM SEPARATOR For DISCRIMINATING BUYERS

The 1909 Model United States

Among the leading breeders and discriminating dairymen the **United States Separator** is recognized as the **Best High Grade Separator made,** *and is used by them.*

We want the opportunity to demonstrate to prospective purchasers that the **United States** is **cheapest in the long run.**

It costs no more than other Separators of equal capacity. It lasts longer, gives less trouble and has far greater cash value.

It is **cheaper** in the end than Separators selling at lower prices, because there are practically no **repair bills,** because it does **better work,** because it does it **easier.**

The **United States Separator** is the closest skimming Separator made. It *Holds the World's Record* made in fifty consecutive runs on milk from ten different breeds of cattle.

United States selling agents in every dairy section **will allow free trial** to any prospective purchaser. If you do not know the address of the local agent, write us for Catalogue No. 20 and your request will be promptly attended to.

Malthoid Roofing

Mr. W. T. Somes, Proprietor of Bimini Hot Springs Hotel, Los Angeles, Cal., U. S. A., writes as follows: "Our hotel building, a flat roofed structure covered with Malthoid Roofing, is situated quite near the large Bimini Bath Houses that burned so fiercely the night of November 15th. The wind carried the blazing shingles and red hot cinders in showers to my building, where they simmered on the Malthoid Roofing and went out, doing no damage beyond a number of small blisters raised on the surface of the roofing. We have had one rain since the fire and the roof is tight."

Live Stock and Dairy

By Mrs. Minna E. Sherman

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

THE HEIFERS.

HEAVY producing cows, either as milkers or as butter makers, are made in two ways; by careful breeding, and by careful training from calfhood. The cow cannot be starved nor indifferently milked at any old time that suits the milker, and hold up in her producing. There are many things that enter into a breeder's skill that he stamps with an individuality. The herd comes to have a character. In looking over a herd of cows, an experienced eye can tell at once if the herd is home bred or purchased. Dr. Haring of the State University was here last week, and in looking over the herd remarked on the sprighty look of the cows, and on the fact that they held up their heads and moved alertly. While I had not thought about it, I saw that it was so. Though gentle, they were interested in everything going on. I think it is the result of fearlessness. They know that Alex has only kind words and a song as he milks them.

Breeding Age.

The tendency is to breed too young, when the heifers are yearlings or even younger. While it is natural to wish to increase the herd rapidly, I doubt its ultimate wisdom. I should not breed anything to come in sooner than in two and a half years. This will give cows at once and make them profitable from the start. Milking a string of babies is not so profitable as mature cows. While we prefer to put them into the milking string at thirty-four months, it is not always possible to do this, as the time in which a heifer freshens has much to do with her future usefulness. The habit of fall freshening should be cultivated. Have the heifers come in fresh in September, October or November. The flush of milk from the fresh animal is then caught, and when a little dropping down comes, the fresh grass again builds up the milk flow, and the cow is pushed along into a good full year of milk. It is the keeping at it that makes the records and makes the money come in. A herd loaded up with cows that only produce five or six months in the year is carrying a heavy weight of unprofitableness to the owner.

Size.

Sometimes, by accident, heifers are bred at too early an age. These rarely attain full size. I believe in a good sized animal, one that has room for good lungs, heart and stomach in her frame. Holstein cows could be bred in a hundred years down to nanny goats. That is what some of the breeders on the coast are doing today. Find out the herd book weight of the cows of your breed, whatever breed you may prefer, then try to keep the cattle up to it. The founders of a breed were deep thinkers, and the producing of a cow is not the result of a "lucky find," but of the application of well considered principles. Size may not be everything, many think. It is not, in the mind of the skilled breeder, but in the hands of the beginner it is an important matter, as it is the simplest possible test to show that he is not running the herd into the ground. Size, therefore, must be watched as well as vigor. The cow is the sum of all her ancestors, with her own personality added. She may carry the total inheritance in her blood, but if she is a poor individual, she cannot work it out. She must be made the vehicle through which the part is acted. All the dramas of Shakespeare, learned until letter perfect, will not make an actor. The personal fire and strength must be there to light up the lines of the grand old master.

Motherhood.

The stunted cow does not make as good a mother as the one that is more fully developed. The cow must have vigor of health herself in order to transmit it to her offspring. The high record for seven days test by heifers can be increased if they come into milking while fat. Then push them along with heavy feeding, and they will respond in milk, if they can stand the strain. If they cannot, they go to pieces with indigestion and may never be so good again. The future is spoiled by a little over work. Like young horses, they go stale from over training and fail as money makers. The fat on heifers disappears rapidly into the milking pail if they have been bred from a heavy milking ancestry. The heifers should not be bred again until four months after calving, and this will bring them a full year in milk. They should be milked right up to the end, or until six weeks of calving time. Feed them a full ration up to within three months of freshening. This is the education of the young cow, and they must be watched closely, for when they drop down to a pint of milk a day, the milker does not like to be bothered with them.

Cow-like.

The breeders often think that if

Peter Bacigalupi & Sons, 941 Market St. San Francisco

they leave the heifers too long unbred they grow steer like in appearance ,and coarsen. It is certainly true that the feminine type remains undeveloped until they came into their natural condition of motherhood. Let them look strong and masculine until after they calve. In a few weeks after the calf is dropped the whole body begins to change and they grow more and more feminine. It is a strong femininity instead of the delicate forced one of the early bred heifer. The female of all animals must possess great vitality if the offspring are to be strong and well developed. The one and only valid reason for early breeding in cows is that they are less likely to have congested udders and less apt to become shy breeders if started early in life. The shy breeding cows are usually the over forced ones in feeding to make show ring records, or to take records as big butter makers. Shy breeding of later bred heifers has not been our experience. Old Buttercup came in at three years' old and passed away at twenty, leaving the ranch richer by twenty-three of her calves. These happened to be all heifers except one pair of twin bulls. I paid ten dollars for Buttercup as a calf six months old. Sixteen of her daughters sold as cows for $1,280. Buttercup was simply a common cow that made three hundred and fifty pounds of butter in a year. The daughters were half Holsteins and all good cows. Why? Because they had a good dam and because she nicked kindly on the Holstein blood, and these heifers were allowed to reach their strength before being bred. Then they were fed! fed! fed! until all the old men in the neighborhood came to advise me against buying stacks of alfalfa to put into the cows' stomachs.

This is only part of the story, for the vineyards and orchards responded to the liberal manuring and paid the feed bills with their increased productiveness.—M. E. Sherman.

The silo is as capable of helping out the summer pasture as it is the winter supply of roughage. Our eastern brothers use it for such purpose, thus enabling them to keep what appears to the western man an almost unbelievable number of cows on small pasture acreage. When our land becomes valued at over $100 an acre, as some of it now is, the silo will be seen with its round form in the sky, all over the country where cows are milked; indeed, the silo is already seen in the older settled, higher valued lands.

A poor workman is always finding fault with his tools, is an old saying. Likewise, the owner of scrub milk cows is always finding fault with dairying as a business .

In buying sheep, like anything else, get the best stock you can. If you can't afford to buy anything but scrub ewes, then buy fewer of them and use the money thus saved toward buying a good buck.

Did it ever occur to you that artificial drainage of lands conserves moisture as well as prevents the land from becoming seeped or washing?

Common black molasses that, a few years ago could not be sold for anything is coming rapidly into favor as a stock feed.

See that your stock have good drinking water.

Future Citizens of Kerman, California

J. W. Brooks, J. B. Deardorff, J. W. Lamb, J. W. Cook, E. M. D. Smith, C. E. Wells, C. F. Anderson and L. W. Brooks, all of Towner Co., N. D. Together they bought 220 acres of land March 18, and will help to make Kerman the richest colony in California.

Do You Know

That the east is burning up with land hunger? That productive lands are getting scarce and hence higher? Do you know that the people east are just beginning to find out that there are agricultural lands in California and hence that we are on the eve of the greatest emigration movement California has ever experienced.

Do You Know

That as a consequence it behooves all who are landless in California but who hope sometime to enjoy the blessings of a landed home, to get busy and to secure the home before the other fellow gets it, and before prices have advanced to where they are prohibitive? That the easterners who are coming here now are astounded with the agricultural possibilities of "New California?" That they are buying themselves, and then going back home spreading the news of their find, and inducing others to come?

Do You Know

That ere long the man who owns productive land here will discover its value, and will refuse to part with it at several times the amount it now takes to "lift" it, and that when that time comes it will be everlastingly too late for many.

Do You Know

That the value of land depends upon what it will produce per acre? That land on the **Kerman Tract** is today the cheapest land in the United States, value of possible products considered? That this fact is becoming known, and that it is bringing more people here than have ever come to any other similar tract in the same length of time?

Do You Know

That the **Kerman Tract** excels when it comes to water right, quality and lay of soil, natural drainage, location, and in possibilities for fruit and alfalfa growing, dairying and poultry raising? That it is unsurpassed, if equalled, in the things that go to both home and money making? That it is being populated by the very best quality of people, the cream of the country? That undesirable people are not allowed to buy land here and that those who locate are protected against the scourge which has ruined so many otherwise promising colonies in California? If you do not know these things now

We Are Telling You

And we ask the privilege of further informing you. If you are interested we would like nothing better than the chance to satisfy you upon all these points, either by correspondence or by showing you over the tract. We consider it a pleasure to show interested visitors over the colony, and all comers are accorded courteous and considerate treatment. Our circular explains in detail what is here, and it is free for the asking. Write for it, and do it now. But, what is better, come here and satisfy yourself that the **Kerman Tract** is as represented, and that you are not missing something that cannot be retrieved by not taking advantage of this opportunity now. Either write to

Making Irrigation Ditches by Machinery on the KERMAN TRACT

On this tract, and in two months, over 6,000 acres of new land was put under water, and into fruit, vines and alfalfa.

For Your Pocketbook's Sake---Read This

I am so confident that the Olds Engine is the most economical and most durable engine you can buy that I will make this proposition to every buyer of an Olds Engine.

I agree to replace, free of charge, any part of an Olds Engine that breaks or becomes worn, from any cause whatsoever, within one year from date of shipment, provided the replacement is one you think should be borne by the manufacturer. You are to be the only judge. There is to be no argument, no delay in returning old parts and getting new ones; you decide and I abide by your decision.

J. B. SEAGER, Gen'l Mgr.

Do you think this proposition could be made on any engine but a practically perfect one? You can easily see that to stand this supreme test of durability and perfect workmanship it must be built right, of the very best material, of the simplest construction. This is the kind of an engine you want. You take no chances in buying an Olds. All of my representatives can furnish these repairs without any delay. They do not have to consult me. Write to my nearest agent. He can fix you out with the best engine you can buy, no matter what others cost.

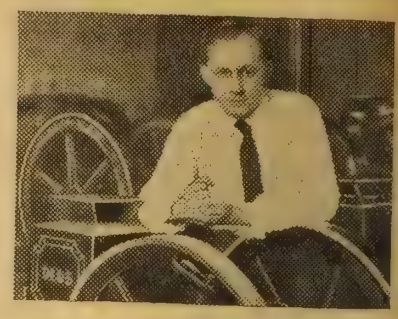
OLDS ENGINES

Give you the power you need at the price you can afford to pay for it.

They are the cheapest engines you can buy—simple in construction, most economical to run, do not get out of order, easy to start winter or summer—a ten-year-old boy can run the Olds Engine just as well as a man.

Thousands of farmers have found out the superiority of the Olds over all other engines. The United States Government must have found it out also because they buy Olds Engines for their military institutions, forestry and irrigation departments. Uncle Sam thoroughly investigates everything he buys. The Olds Engines stood the government test just as they will stand every other test.

For thirty years we have made nothing but Olds Engines. We know the Engine business just as you know your sitting room. Our business has steadily increased during that time. What made it? Why, because the Olds Engine did just what we claimed for it—every user was satisfied and knew he had got more than his money's worth, and he told some one else about it



J. B. Seager, Gen'l Manager

YOU cannot afford to do without an Olds Engine. The first cost is saved so quickly in time, labor and money that no shrewd farmer should try to get along without one. The daily cost of an Olds Engine is so small it is hardly worth while counting, compared with the work it does.

There are not two farmers out of a thousand who could not use an Olds Engine with profit to themselves on their farms. You know what can be done with an engine on a farm better than I. You know an engine is needed on every good farm, but probably the reason you have not one now is because you have felt you could not afford it, or had some idea an engine was a difficult thing to run, and an expensive thing to keep in order, or perhaps you have had an engine that did not give you satisfaction. Not so with an Olds. You can afford it. Thousands and thousands of successful farmers have felt just as you do, but each man owns an Olds Engine today, and now he wonders how he ever got along without it.

Do you think the big successful men of this country would be where they are today if they had not kept up with the times? They bought the things they needed to increase their earning power. A successful man can always find a way to pay for a necessity in his business.

I guarantee every Olds Engine that leaves the factory to be in perfect running order. I do not spend much time in the office. I am out in the shop with my coat off watching every detail. By keeping right out among the workmen, seeing that all the little things are actually done, I know the engine you get is all right, and that the high Olds standard is maintained. I also know the engine is "Best by every test," because I look after the testing and inspecting myself. They are the best you can buy, whether you pay less or more than the Olds price.

Write me about your own particular case. Let me advise with you. What I can tell you will fit your case exactly. Then you can decide what engine to buy. J. B. SEAGER, Gen. Mgr.

Some of the Features of the Olds Engine

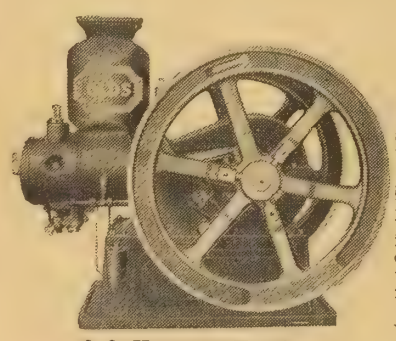
Olds Patent Seager Mixer

The only one that makes a perfect mixture of gas and air, giving the greatest power. No pump to leak or get out of order—no moving parts.

Removable Valve Mechanism. Removable Water Jacket. Jump Spark Ignition

Piston and cylinder ground to a perfect fit, giving better compression and more power.

Our catalogue explains these points in detail



4-A Hopper Engine

Simplicity, three separate inspections, durability, economy and certainty of operation.

Olds Engines are of the highest efficiency at the very lowest price because we can produce them without wasting a penny's worth of labor. There is a machine for every operation, and each piece, down to the smallest bolt or nut, is made of the very best tested material at a cost that could not be lower without cutting quality. Don't be misled by statements about "cheapness" in engins. Nobody can afford to buy a poor engine at any price, but there is a point where the highest quality can be had at the lowest cost, and the Olds Engine, because of the factory in which it is made, and the workmen who make it, stands without a superior in this respect. They are not slighted in places you cannot see, or where only an expert can discover it, but thoroughly well built through and through, in a factory that is known the world over as one of the most modernly equipped engine factories that has been built.

That is why we give you a durable, simple, strong, high-grade, perfect-working, long-lived engine at a low price.

Irrigating

You cannot afford to have your engine fail you when you require water for your crops. You buy both economy and insurance with an Olds engine. Made in all sizes from 3 H. P. to 100 H. P. Visit the nearest Olds Engine Pumping Plant. Ask the owner how he likes his Olds. There are Olds Engines in your neighborhood.

Write us for location.

Do Not Think of Buying an Engine Without Investigating an Olds

Write Today for Our Handsome Catalogue

It contains many fine pictures of the very latest models of Olds Engines with a detailed description that makes the engine question as plain to you as an open book. It contains letters from farmers who have used the Olds Engines, and they give their practical everyday experience with it.

Olds Engines are made in all sizes to suit every kind of work on the farm. We have exactly the kind of engine you want. Tell me what you want to do with it, and I will tell you just exactly the kind of engine you want to buy to do the work. It will be an expert opinion that costs you nothing.

Our hopper jacket engine on skids or wheels, 3 to 12 H. P., is ready to run when you get it. Fill it with gasoline, throw on the switch, turn the wheel, that's all. No piping to connect, nothing to set up, always ready, can be moved anywhere.

We also make regular engines 8 to 50 H. P. for heavier work.

Every Olds Engine is fitted with the Seager mixer which is recognized as being the most effective mixer that has ever been invented. No pump to leak. No moving parts to get out of order. They also have a removable water jacket so if through carelessness the water should freeze, but very little damage is done.

It is to your decided advantange to send for our catalogue

Do it now before you forget it. A postal card will do; but better still write me a letter, telling me what you want the engine to do, and you will get a personal letter from me that will give you the facts you want.

Irrigation and Forestry

RAISING THE TIMBER CROP.

THE term regeneration is commonly used in forestry to signify the renewal of forest trees on the land. It is a convenient term and well worthy of general use. The different forms of regeneration may be referred to as, (1) regeneration by natural seeding; (2) regeneration by artificial seeding; (3) regeneration by planted seedlings; (4) regeneration by planted cuttings; (5) regeneration by sprouts and suckers (i e., coppice-growth.)

The method of regeneration best adapted for one section may not be at all fitted for another section under different conditions, and often it is best to combine two or more of the different forms of regeneration.

Where natural regeneration of valuable species can be easily brought about, it is generally the best practice. This is especially true in sections where timber is comparatively cheap, as is generally the case in this country where the returns from the land can hardly be expected to pay for any great amount of labor.

(1) Natural regeneration by seed may be greatly assisted by stirring the surface of the soil in good seed years, just before the seed is scattered, and by thinning enough to let in light and air to the seedlings. When it is desired to have an open field adjoining woodland thus seeded, the land may be plowed or loosened with a disk harrow or drag, and put in such condition as to make a sufficiently good seed bed. When the soil will not permit of such exceptional treatment, it may be loosened by a drag made by tying together several oak branches, or small logs, which, when dragged over the ground several times will gradually break up the surface. This will be especially necessary where there is a thick covering of mold or "duff" on the land. This same method of stirring the soil is applicable when the land is to be seeded by hand. Good seed years do not occur often in our most desirable species, and it is very important to take advantage of these good years when they do come.

Natural re-seeding is almost the only practical means of re-stocking large areas of forest lands, as other methods are too expensive. It generally takes place readily, and the chief reason why it is not more successful is the frequent destruction of the young seedlings by fires, by cattle and improper methods of logging.—From Cyclopedia of American Agriculture, L. H. Bailey, Editor-in-Chief. Reproduced by permission of The Macmillan Company, New York.

THE SCIENCE OF IRRIGATION.

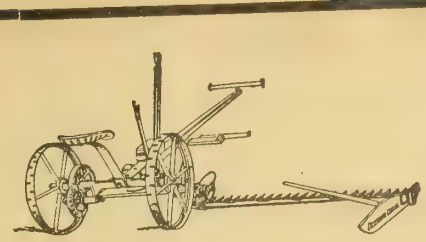
(Continued from Page 614.)

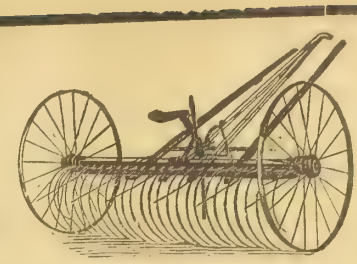
ter with furrows five feet apart, so that it will raise a good stand of grain provided it once sprouts. Whenever the sun is very low in midwinter and the nights cold the moisture will show at the surface all the way between the furrows. This may dry an inch or two during the day if the sun is bright, as it usually is, but if it is cloudy it will probably remain moist all day.

You should test these questions, but not be discouraged if you fail to wet the whole surface, or if you cannot raise the moisture nearer to the surface than one foot between the furrows three feet apart. It may prove that the soil is better adapted for trees or vines than vegetables, or that the furrows should be closer together, or that it is better for some trees than for others. With alfalfa it makes no difference and the same probably with any deep-rooted plant. But where the soil is too open, and increasing the size of the streams has no effect in spreading water to the sides, then flooding is the only way left.

When you return to look at your little streams you may find some broken out into the next ones, or several have made a big puddle from a slight swell of land running crossways and quite invisible to the eye. If the streams carry any rubbish it will be apt to collect wherever they reach the ground even half an inch higher than their beds. The formation of a little dam is then quite certain, followed by the breaking out of the stream from the backwater or the formation of a pond by several streams uniting. To avoid this, even greater care should be used in grading than in flooding, for now you have no levees to force the water on certain lines. The grading is generally cheaper, for there is very little carrying to be done. Instead of scraping off top soil too much you must make more faces, each with its own distributing system. Most all the grading can be done with a drag, provided it is very long, stiff and heavy, with good scraping edges. One edge may do, but the drag must be long and stiff or it is worthless for taking down the low swells that interfere with the even flow of the streams. Cutting these deeper with the plow, hoe or furrower will not always remedy the trouble. Being deeper they will collect more leaves or rubbish when there is any wind; and, as these furrows are broken up after every irrigation, the next ones may not be in the same places the others were and a variation of but a few inches may compel deeper cutting again. The trouble is that if one stream fails to go through with the rest you may not have the water long enough to send it through afterwards and if you crowd on more water it may disarrange all your other streams. In any event, it is such a nuisance that it will pay you to insure a uniform flow of every furrow by careful grading at the start.

For the same reason all weeds, dead grass, sticks and other rubbish should be removed from the ground as far as is consistent with reasonable economy. The harrow and hay rake used often enough will do it. You must bear in mind the difference between raising a few things for home use and raising them on a large scale for market. Thus a patch of black berries at the end of a field to take the waste water may be a great success for your table, no matter how badly irrigated so long as they have water enough. But to run a large patch for market that way would often mean light profit and possibly none. You cannot always see these things at once or believe that such trifles count. But the years tell a different tale to the grower who keeps close account of every cent as many do. It may seem silly to talk of combing the ground free of trash and worry over an inch of rise in a furrow. But when you see the work done by a long fine thread of water so fine that the camera can give no idea of it with the best light you can pick, and see 200 or more of these winding over a ten-acre tract while the owner is snoring serenely in the hammock, you will conclude that you can take considerable trouble at the start to secure such ease and certainty of results later on.—T. S. Van Dyke, in Irrigation Age.





Seasonable Goods

Of special interest right now, are our Harvesting Machines, Hay Tools and Hay-Presses. We have made it our business to get hold of the best in these lines. We especially call attention to the following:

Deering Ideal Mowers; perfect shear-cut, ball and roller bearing—nothing better made.

Deering Ideal Self-Dump Rakes; strong, durable—first class in every particular.

Dain Buck Rakes and **Stackers;** scores in use in Southern California. They are built right and will positively carry the teeth off the ground when heavily loaded. Power lift—easy to operate.

Southwick Hay-Press—without question the best horse-power press made. Many of our customers have averaged 30 tons per day or better for entire seasons' runs. We also have the Sandwich Engine power Belt Presses—of wonderful capacity. Smaller Presses, too—all steel, self feed.

See us or write us today.

HONOR THE BRAVE.

Honor to those who gave up their lives for their country will never cease. To be sure, there are periods like the present when the respect paid to the fallen dead is intensified, and very properly so. Since soon after the close of the civil war memorial day has grown in favor and in general observation until, now, practically the entire nation honors the brave dead. Occasionally there is a discordant note where sports and games are injected into the sacred day, but we believe this desecration is decreasing every year. We do not believe that a proper observance of this day permits of these games and merry makings.

To one who has stood in one of our national cemeteries, for example that at Chattanooga, Tennessee, where seventy-five acres are filled with the little white head stones, and where one may gaze into the distance, viewing only the white head stones under the trees, the appreciation of the debt we owe is brought home forcibly. In that cemetery, between thirteen and fourteen thousand soldiers have been buried, and one-third of the graves are marked only with small square posts inscribed simply with a number. Acre after acre of these headstones show the vast number of brave boys who died and were laid in these unknown graves.

But besides these vast numbers in well cared for national cemeteries, no cemetery in the land but is honored by being the last camp ground of one who supported his country in time of trial. Let these graves all be honored by the scattering of flowers, and still more by words of appreciation for the service rendered.

TARIFF TINKERING.

The persistence with which manufacturers are pulling for free farm products and high protective tariff on the manufactured article may be characterized as worthy of a better cause. Tom Reed once remarked: "If you are thinking of relaxing Protection in any direction, you had best not begin with the American farmer."

The most pronounced case of this effort is doubtless that of the shoe manufacturers and tanners. "Free hides" is their slogan. "If the poor people of the manufacturing centers are to be kept from starvation, they must have a very high tariff on the manufactured article which they wish to sell to the farmers." Of course, the principal cry put out to the people is that in order to export the manufactured article, they must have the raw product at as low a price as possible. But, they always cover up the fact that of the fifteen per cent duty which is levied upon hides imported, a ninety-nine per cent rebate is allowed when the shoes made from this imported raw material are exported.

The case of Free Hides vs. Dutiable Hides is all on the side of the American farmer. To him the steer is a finished product and the hide a part of that product. Best not begin with him if you are thinking of taking Protection away from anybody's finished product. If you do, there will be no Protection left for anybody.

SAVE THE FORAGE.

In working for the improvement of range conditions on National Forests, Uncle Sam has invited and has received the co-operation of stock associations in all parts of the West. California stockmen have not been at all backward in taking advantage of this opportunity to benefit the industry.

At the last meeting of the Calaveras-Alpine Stock Association at Sonora, the fact was brought out that many meadows and flats in the Stanislaus National Forest can be improved and the amount of forage increased by irrigation or other means. Steps will therefore be taken by the Forest Service in co-operation with the stockmen, to bring this about, whenever such action will not conflict with the rights of individuals obtained under State laws.

By conserving the present forage through the prevention of over-grazing, and by increasing the feed through seeding or other artificial means, the government hopes to be able to not only place stock raising upon a safe and permanent basis, but to increase the quality and quantity of beef-producing cattle.

REPUTATION.

Some weeks ago we attended an institute at which Mrs. Sherman was delivering an address on the shipping of table grapes. She referred generally to the varieties which ship best, manner of packing, remedies for mildew and other diseases which have to be contended with, etc. But the point which impressed us most was her reference to her personal interest in, and oversight of, the packing operation. She spoke of the pleasure that lay in watching the deft fingers of the girls arranging the clusters of large berries in the baskets, and of the music in the air as each would call for her fresh supply of "f-r-u-i-t," and then as the fruit was carefully placed in the car, of her feelings as she thought of all it meant to her. She said, "It makes me tremble for my reputation when I see all this fruit going away three or four thousand miles and into the hands of strangers." Such a feeling may be somewhat trying and racking to one's nerves, but unless one experiences it, there is great danger of the reputation not being kept at the point Mrs. Sherman's is, as the shipper of high grade table grapes. There is a satisfaction, and even pride, in maintaining such a name, but, more particularly, we would refer now to that which probably gives more satisfaction to most of us; that is, the financial returns. If this would be satisfactory, we must tremble for our reputations and take the utmost pains in sending to the markets only that which we know absolutely is of the highest grade.

When one employs a great number of hands, it is almost impossible, but a means of supervision must be devised by which it is possible to keep watch of the work of careless or inefficient employees. Otherwise indifferent fruit will be allowed to go into the baskets in such a manner as to cause decay or at least be displeasing in appearance. Best returns demand concern in every step on ranch and in packing house.

FROST PROTECTION.

The cold wave which struck Colorado recently did immense damage, but we note in the newspapers that more than $3,000,000 worth of fruit was saved by the use of oil pots and coal buckets. The cold was intense for two nights, but in all sections where there was co-operation in smudging or firing, from five to ten degrees rise in temperature was secured.

Fruit growers of California have done some of this, but we do not think they have ever attempted it on so large a scale or with the unanimity which was seen in Colorado. It may not be of value to refer to the subject at this time of the year, for it is many months before damage by frost will again confront the orchardist, but recalling the frantic appeals which came to this office as to where frost protection material might be secured, at the time of December cold snap, we speak at this time to remind orange and lemon growers especially that in time of peace it is well to prepare for war.

ITALIAN COLLEGES OF AGRICULTURE.

A recent number of Cornell Countryman contains an interesting interview with Professor John Craig, in which he describes the five colleges of agriculture in Italy, located respectively at Portici, near Naples, Perugia, Pisa, Bologna, and Milan. Two of these institutions are under the direction of the State Department of Public Instruction and three under the Department of Agriculture. The entrance requirements to the colleges of agriculture are the same as to the universities. The enrollment of students is relatively small, not more than 150 students being in attendance at any institution. These students belong to two classes, the sons of land-holders who wish to prepare themselves to manage their estates and those who are preparing to teach agriculture.

DECIDUOUS FRUIT MARKET.

It is with pleasure that we announce to our readers that we have arranged with a correspondent at Sacramento to give to them, beginning with the next issue, reports of fruit forwarded and general deciduous market conditions. These reports will continue during the heavier part of the shipping season and will be written especially for our readers. We hope to make these more complete even than the citrus fruit reports.

"The problem of production has not ceased to be fundamental but it is no longer final; just as learning to read and write and cipher are fundamental but are no longer the final ends of education. We hope ultimately to double the average yield of wheat and corn per acre; it will be a great achievement; but it is even more important to double the desirability, comfort, and standing of the farmer's life. * * * We must try to raise the average farm life, and we must also try to develop it so that it shall offer exceptional chances for exceptional men."—Theodore Roosevelt.

"Seek to provide for the people on the farms an equipment so broad and thorough as to fit them for the highest requirements of our citizenship, so that they can establish and maintain country homes of the best type, and create and sustain a country civilization more than equal to that of the city."—Theodore Roosevelt.

Agricultural Notes of the Pacific Coast

Northern California

Prunes promise light crop in many parts of the valley.

Shasta County gives promise of a great crop of fruit.

The first cutting of alfalfa over the valley proved very satisfactory.

The absence of late rains has caused a great shortage in the hay crop.

Sacramento has shipped vast quantities of strawberries to Portland and Seattle.

Cottonwood, Shasta county, promises a bumper crop of pears, peaches and prunes.

Ione, Amador county, reports harvesting in full swing with a fair output in sight.

Agricultural Park, Sacramento, is a busy place getting ready for the coming State Fair.

Suisun valley will have a short crop of nearly all fruits this season, Royal Anne cherries being the exception.

Gravenstein apples at Sebastopol promise to be under the average crop, but quality of fruit is exceptionally good.

The first carload of cherries left Vacaville May 7th, and at this time several carloads go forward each week.

The first creamery in Shasta county has just been started at Cottonwood. It is large enough to handle the milk from 400 cows.

Susanville, Lassen county, had a severe frost about the middle of the month which severely injured cherries and apricots.

"Great Development in Store for Sacramento Valley Through Irrigation" is the slogan of development associations of that valley.

Some Nevada county farmers say that the hay and grain crop will be a total failure as it is now too late for rains to be of any value.

A census is being taken of the number of Japanese laborers in this state. Every employer is expected to fill out blanks which are furnished.

It is reported that there was a shortage of a hundred tons of hay last year, which, with this year's shortage, should assure good prices.

Cherry growers have not been pleased with prices offered this year, and it is feared that the immense output will not command a satisfactory average.

The University Farm picnic held at the time of the dedication of the dormitory last Saturday was attended by parties from nearly all sections of the lower valley.

Great preparations have been made for the cannery picnic which will be held on June 4th at Gridley. Excursion trains will be run from various sections of the Sacramento Valley.

Farmers and business men of Cedarville, Modoc county, are contemplating a wagon road to a point on the Western Pacific so as to secure more reasonable transportation rate for products.

It is possible that two canneries at Yuba City will not run this season, as the dumping ground for sewerage has become so restricted that it is impossible to dispose of it until more arrangements can be made.

Central California

Lodi has recently shipped three cars of wine to Germany.

Kerman expects to have a creamery in operation in five months.

Eight hundred acres are being planted to eucalyptus at Kerman.

Pacific Grove recently closed a most successful Blossom and Plant Show.

Cut worms are being reported in nearly all sections of the San Joaquin Valley.

The Tulare County Fair Association holds its next meeting September 13th to 18th.

A contract has been let for the building of the Lodi Co-operative Winery.

Turlock Home Creamery has had its capacity more than doubled by recent improvements.

The crop of prunes in Santa Clara Valley is said to be about one-third that of last season.

Beets in Conejo, Kings county, are reported in fine condition. They will be delivered at the Corcoran factory.

The central part of the state generally will show only a very ordinary yield of hay. Grain will be exceptionally light.

Pajaro Valley shippers hope to have an improved harbor for Watsonville in the near future, which will greatly increase shipping facilities.

The contest between the Farmers' Union and the prune growers who wish to form an organization separate from the union is still on in Santa Clara Valley.

Prof. Day, connected with the Experiment Station staff, and who has made extensive investigation of the Argentine ant, reports little danger of this insect becoming a serious pest.

The fruit growers of the Pajaro Valley are considering the erection of a cold storage plant at Watsonville with a capital stock of $200,000 divided into 200 shares. The plant is to have a capacity of 500,000 boxes.

Kern River farmers suffered a great loss in the breaking of the levees. Many cattle were drowned and crops covered with water. More than ten thousand acres of barley and wheat lands were flooded.

The stockholders of the Lodi Products Company, which controls the grape juice plant, have decided to increase the capital stock. There is now on hand more than a hundred thousand gallons of juice of last year's manufacture.

At the state meeting of the Farmers Union held at Fresno there were delegates from 58 local unions. The directors chosen for the coming year are A. Sorenson, of Fresno J. H. Dawson of Hanford; H. H. Bennett of Tulare; L. S. Miller of Santa Clara valley, and J. M. Herron of Atwater.

The bean growers of Ventura county have perfected their organization by incorporating and electing a board of directors for the first year, as follows: T. G. Gabbert, Charles Donlon, R. G. Edwards, George C. Power, H. K. Snow, Jr., C. L. Chrisman, D. F. Sheldon, Joseph D. McGrath, F. A. Snyder, John Darling and A. Camarillo. The capital stock of the corporation is $500,000, divided into 10,000 shares of the par value of $50.00 each.

Southern California

Southern California grain crop will be short.

Redlands recently had a shower of over half an inch.

Cotton planting is in full swing in the Imperial Valley.

Coachella Valley is planting a large quantity of orange seeds.

Bee men at Fairmont report exceptionally heavy honey flow.

Coachella, Riverside county, shipped her first apricots about May 10th.

Thermal, Riverside county, recently shipped five cars of onions in one day.

A twelve inch well nearly 400 feet deep at San Jacinto has shown a fine flow of artesian water.

Thermal, Riverside county, is now making regular daily shipments of egg plant to Los Angeles.

Arlington, Riverside county, is claiming she will become a poultry center which will soon rival Petaluma.

A proposition has been made to San Jacinto to locate a sugar factory there conditional on a payment of $20,000 bonus.

A Redlands orange packer has gone to Porto Rico to give instructions to orange growers there in packing house methods.

Forest rangers recently held a meeting at San Bernardino and discussed the rules which govern the forest reservations.

A petition has been filed asking that a large body of land in Santa Barbara county subject to overflow be formed into a reclamation district.

Prof. Ramsey, of Whittier, is spending much time this season looking after varieties of walnuts immune to the blight.

The Orange County hens are crowing over the law recently enacted which prevents the selling of cold storage eggs as "fresh extras."

Raisin Day was such a success that now Coachella Valley ranchers are appealing for "Onion Day" to be observed all over the United States.

The packers in the packing house of the Upland, Sam Bernardino County Citrus Association, recently made a demand for 3½ cents per box instead of the former 3 cent price for packing oranges.

Lemon growers are somewhat concerned as to the tariff on lemons. Reasonable assurance is given that no reduction will be made, and some are yet hoping that the half cent increase may be secured.

J. P. Bradford recently sent us a photograph of his outfit hauling cabbage to El Centro, Imperial Co., market, showing eight horses hauling a wagon and three trailers well rounded up with cabbage.

San Jacinto people are elated over the fact that the sugar factory has finally been settled upon as a certainty for their town. It is rumored that the factory will be one of the more complete factories of the state.

Experts are experimenting with development of a more perfect lima bean in the bean fields near Oxnard. 10,000 typical and almost perfect plants were chosen last year and the seed from these was used as a basis for this year's experiment.

The Coast

The A- Y- P opens at Seattle June first.

Colorado has 80,000 acres in commercial orchards.

Hood river orchard lands are selling at $1,000 per acre.

Beet growers at Fort Collins, Colorado, pay $20 per acre thinning beets.

Onions have been proving an exceedingly profitable crop at Mesa, Arizona.

Wool buying is progressing in eastern Oregon, wool commanding about 24 cents.

Trans-Mississippi Commercial Congress will hold sessions in Denver in August.

Forest fires have already started in the mountains near Newport, Washington.

The Willamette Valley farmers were recently made happy by an abundant rainfall.

Sugar beets and even alfalfa were greatly injured by the late frosts in Colorado.

The fourth Dry Farming Congress will be held in Billings, Montana, October 26, 27, 28.

The last legislature of Hawaii passed an act authorizing the establishment of an agricultural college.

It is believed that Eastern and European capital will develop large holdings of land on the lower Gila river, Arizona.

Farmers of Fallon, Nevada, are maka raid against magpies which prevent the multiplication of quail and other prized birds.

The government has just opened the lands of the Shoshone Irrigation Project for settlement. Over 150,000 acres are thus opened.

The crest of the levee along the Gila river has been raised over two feet. This will guard the land near Yuma from forty feet of water.

The shipments of hops by rail and water from Oregon for the past eight months aggregate 90,484 bales, or nearly 40,000 bales less than last year.

It is rumored that a company made up of eastern capitalists has made large purchases along the Gila river and will develop a large body of land.

The vigorous advertising campaign carried on in the interests of Hawaiian Islands has led to a substantial increase in demand for pine apples.

The annual election of the stockholders of the Salt River Valley Water User's Association of Arizona, reelected its former board of directors.

The Oregon Threshers' Association recently held its annual meeting at Portland and elected W. H. Fletcher of McMinnville. President, and Phil S. Bates of Portland, Secretary.

The recent cold snap which threatened the fruit industry of Colorado showed most of the farmers prepared to combat frost damage with the use of smudge fuel. It is estimated that over $3,000,000 worth of fruit was saved.

The wool buyers are taking advantage of the fact that the Baker City, Oregon, sale which was scheduled to come off the first of the month has been called off. They are now buying wool in all sections, and not to the advantage of the wool growers.

Don't Forget Quality

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

MITES.

A SMALL insignificant subject, but oh, the loses these pests cause us! One gets careless a few days, and lo and behold, they accumulate by millions and millions, to the torture of the fowls, and the emptiness of the egg basket. I thought my well distillated coops so exempt from mites, that I became rather careless myself during a visitor's stay, and when I sprayed them again I found a deplorable state of affairs. Under one nest that was placed under a shade tree but a short time before, there were bunches and bunches of fat hearty looking mites on the bricks the box was sitting upon. In the corner of one coop, they had massed behind the plate under the roof and were very hard to dislodge. Spraying them from the inside drove them out and the outside of the coop also had to be soaked full of kerosene or distillate and more poured between the joining places of every board, for where the boards were nailed onto the plates, there they were, thick and plenty, and a steady stream of oil was poured on until they were driven through and routed out. Every two weeks the same treatment will be necessary during the summer, but a solution of some of the mite killers on the market will probably prove as effective as the distillate and kerosene, which happened to be handy, therefore I used it.

Seems to me it is time to invent a coop of galvanized iron, that will contain no joints nor laps where these pests can find a hiding place. Whitewash cracks and scales up enough to make ideal breeding places for these vermin, and wherever two timbers meet, there is a nest ready for them to make their homes, coming out in droves to dine off our poor abused chickens, draining their very life blood, then going back to their lairs to dream of other raids all day, and coming out fresh and hungry as soon as the birds go to roost the next night to repeat their depredations, and we wonder "why those hens don't lay?"

O! The Mites, Mites, Mites, how our carelessness invites
Hoards of these unwelcome guests to come and stay.
Cracks and nailholes they adore, fill them full and look for more.
And the way we build our coops makes homes galore.
For their sisters, aunts and cousins, and they bring them by the dozens,
And their tribes increase by thousands every day.

—Mrs. Metcalf.

POULTRY QUERIES.

Hatching Peacocks.

I came in possession of eight Peacock eggs and put them under a hen to hatch. As I do not understand anything about peacocks, I would kindly ask you what and how to feed them. Any other information concerning peacocks would be appreciated.—L. S.

Peacocks hatch in from 24 to 29 days and require practically the same care as do young turkeys, with diet of hard-boiled eggs, cracked wheat, wheat, coarse oat meal and bread crumbs. They will hunt for insects and worms very soon, and if these are not to be found, will need a trifle of fresh meat occasionally. They must be protected from wet and cold the same as young turkeys, and are much tamer and pleasanter pets. They have very unpleasant voices, especially when they learn to waken one early in the morning, as they will do if they learn which window belongs to their mistress.

They love to roost very high and will try to find a roost when but a few days old. They live to be from 20 to 25 years old, and reach maturity very slowly. The train does not develop until the cock is in his third year, and they cannot be mated until he attains his full plumage.

MOLTING OF FOWLS.

IN a bulletin issued by the New York experiment station, reporting on plumage of fowls and especially on forcing of molt, we note that:

It was found that a Leghorn chick has pinfeathers for flight when it comes from the shell. "In two or three days it develops pinfeathers that will become main tail feathers. The down grows longer and on certain areas of the body develops shafts. Within a few days the shafts burst open, allowing the web of the feather to spread out, but the down often clings to the tip of the opened feather. The ragged appearance to be noticed on two or three weeks' old chicks is due to this clinging of the down tips. The first body feathers to appear are those at the throat, just above the crop. From this point a line of feathers extends down each side of the crop and breast. When this line begins to show, a tuft appears on each thigh and a line down the spine. The feathered areas increase in size as the chick grows older, so that at the age of four or five weeks they have grown together and the healthy chick looks to be well feathered. . . . The first feathers were stained red and those that replaced them were stained black. At the age of eight weeks all the red feathers in tail and wings had been molted, and at 13 weeks all the black feathers had been replaced by white ones."

Just before maturity another molt takes place. "The pullets appeared to undergo this molt whether they laid or not. After the pullets began to lay they seemed to shed no more feathers so long as they continued in production. When they ceased to lay many of them began to molt. In some cases the molt was complete, extending to the flights and the tail; in others it went no farther than the body feathers, while in still others it included only a few feathers on different parts of the body. . . . The first mature molt comes at the end of the first year of laying. The rotation followed closely that of the prenuptial molt before egg production commenced—the oldest feathers being shed first."

To test forced molting 232 single comb White Leghorns were divided into 6 lots. "The attempt to force the molt was by means of restricting the amount of food rather than by changing the quality of the ration. The starvation period lasted for four weeks. In the first week the amount of food was gradually reduced to one-half the usual quantity. In the follow-

ing two weeks about one-third rations were fed, which were gradually increased in the fourth week till, at its close, the flocks which had been starved were given all they would eat." To aid in observing the molt and to detect quickly fowls that had escaped from the pens the hens were dipped in proprietary aniline dyes, orange, violet, carmine, and green being found to be the most enduring colors.

The starved fowls lost an average of 0.42 lb. in weight during the process of molt, losing weight in every case but many regaining the lost flesh before the molt was completed. "About one-half of the fowls in all of the flocks were beginning to molt in the first period, beginning August 11, and on September 29, 1907, about 90 per cent of the starved hens and 78.8 per cent of the fed hens were molting. By October 27 the percentage of molting was about equal and continued on this equality to the end of the molt. In regard to new plumage, on October 27, only 6.3 per cent of the starved hens and 5.9 per cent of the fed hens were completely refeathered. November 25 only 34.4 per cent. of the starved, and 62.2 per cent of the fed hens were completely renewed, while as late as December 30, there still remained 16.6 per cent of the starved and 15.5 per cent. of the fed hens which were not in their new coats.

"On the whole it may be said that from August 25 to October 23 the starved flock showed a larger percentage of individuals molting. After that time there was more molting among the fed hens, though both flocks completed the molt at about the same time. . . . The average time required to complete the molt of the three-year-olds was nearly 104 days; of the two-year-olds, about 101 days, and of the one-year-olds, 82 days. The starved one-year-olds averaged to molt more quickly by 33 days, than did the fed; the starved two-year-olds were little affected; while the starved three-year-olds averaged 20 days longer in molting than did the fed birds. The average time required to complete the molt of the three starved flocks were 93.8 days; of the three fed flocks 97.4 days.

"All this would indicate that the molting process continues much longer than is usually supposed, and that there is considerable variation in the time of beginning the molt between different individuals, and between flocks of different ages, also a wide variation in the length of time it requires individuals to complete the molt. One is further impressed with the fact, that, so far as this experiment is concerned, the method of feeding did not materially alter the normal conditions of molting, except with the one-year-old fowls.

"It is apparent that, as molting increased, egg-production decreased. This was true almost without exception with both starved and fed flocks during each period. It was strikingly true during the starvation period. While some of the hens continued to lay after beginning to molt, and a few began to lay before completing their new coat, no hen continued to lay during the entire molting period.

"Persistent layers, unless broody, appeared to begin the molt within a week after the last egg, and were usually in heavy molt in less than two weeks. Those beginning to molt after October 1 shed more quickly and re-feathered more quickly than those molting earlier, especially to the stage

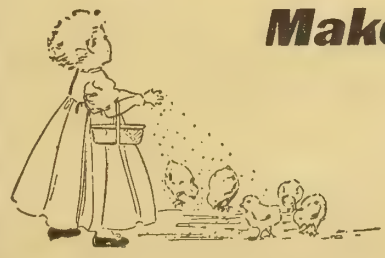
Coulson's POULTRY FOODS

Special Dry Chick Food

Makes Them Grow



Throw it out in the Litter and Make them Work

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequaled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the present high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed, to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE-SAVER. Write us for free samples and prices.

of advanced molt, when their bodies were well protected.

"Broodiness influenced the time of molt to a great degree. . . . . The mortality in all the pens was large. It averaged 18.8 per cent among the starved and 20 per cent among the fed flocks. The two flocks of three-year-olds had a mortality of 21 per cent; the two-year-olds 16 per cent, and the one-year-olds 20 per cent. . . . In these observations it was found that the hens, from all pens, which began to molt before September 15, averaged 108 days molting, while those which began after that date molted in 81 days.

"In the absence of reliable data as to the best method of feeding fowls during the critical period of the molt, it would seem desirable to follow the practice commonly believed to be correct; namely, to feed liberally on rations which are easy of digestion and rich in protein and oil. _ _

"The rotation of molting was practically the same with hens of all ages—the oldest feather being shed first. The chick and hen both feathered more quickly in such areas as would protect the vital parts. From the incubator to the laying period the chicks experienced at least four molts, either partial or complete.

"Hens have individual traits as to season of molting, but seldom as to rotation of molt. Young hens molted more quickly than older ones. . . .

"The 'forced molt' in one year did not influence materially, as to time and completeness, the molt of the succeeding year.

"The starvation process appeared to increase broodiness. . . . As compared to the fed flocks, the starved hens molted slightly earlier and more uniformly. They were in somewhat better condition at the end of the molt; molted (average) in slightly less time; gained less above first weight during molt; gained slightly more in weight during the year; resumed production somewhat more quickly after molt; laid a few more eggs during winter; were materially retarded in egg production; produced less eggs after the molt was completed; produced eggs at a greater cost per dozen; consumed slightly less food during the year; had slightly less mortality; showed slightly more broodiness; paid a much smaller profit.

"The fowls produced the largest profits in the order of their ages. The one-year-old hens produced the greatest number of eggs and gave the largest net profits. The two-year-olds were a close second with the three-year-olds somewhat farther behind, having, however, a good balance profit to their credit.

"There was considerably less mortality in the two-year-olds, which were hopper fed dry mash, than in either the one-year-olds or three-year-olds, which were fed a wet mash."

Experimentalists say that peas, beans, wheat, oatmeal and some other vegetables contain much flesh-forming substance, but it is difficult to say what proportion of them should be used or what quantity given without doing mischief. There are certain foods that give warmth and aid respiration, and certain kinds that restore the muscular waste of the matured (or increase the bulk of the growing) animal. If we give only warmth-producing substances the consumers will fail in the increase of bone, muscle, etc., and if we give much flesh-producing nourishment it goes to waste or becomes injurious.—Western Poultry Journal.

General Agriculture

THE BEET SUGAR INDUSTRY IN THE UNITED STATES.

IN response to a resolution of inquiry which passed the Senate April 8, Secretary Wilson has forwarded a report on the beet sugar industry in the United States. This report contains an interesting summary of facts and figures relating to this industry.

In 1896 there were 6 beet sugar factories in operation and one building, having altogether a capacity for slicing 4,000 tons of beets daily. In 1908 there were 64 factories, with a total capacity of 50,000 tons of beets daily—more than a twelve-fold increase.

From 1898 to 1906 our production of beet sugar grew from 36,000 tons to 484,000, an increase of more than thirteen fold in eight years.

In 1896 41,000 acres of beets were harvested; in 1906 376,000 acres, or more than nine times as great an area.

The price of beets, like prices of other farm crops, has risen steadily. In 1896 the factories paid $4.10 per ton; now they have to pay $5.35.

In 1898 the farmers had 364,000 tons of beets to sell to the factories, for which they received $1,564,000. In 1906, just eight years later, they had 4,236,000 tons of beets to sell, and received for them $21,604,000—a twelve-fold increase in beets and a fourteen-fold increase in money returns.

The total amount paid out by factories for beets during the past twelve years amounts to $121,000,000.

The total capital invested in beet sugar plants in this country is about $70,000,000, and this does not include investments made by factory owners in farm lands, irrigation works, etc.

Among other things the Senate called on the Secretary of Agriculture to state how much beet sugar can be produced in the United States. The Secretary replies that we have demonstrated conditions of soil and climate favorable to beet culture in an area of at least 274 million acres, and that it will only take one acre out of every 200 of this to produce all the sugar we now import from foreign sources.

He estimates "that if the sugar beet were grown throughout those portions of the United States adapted by nature and with the aid of irrigation to its culture, with a system of rotation including the cultivation of the beet every fourth year, 15 million tons of beet sugar could be produced in the United States annually, or more than the world's total production of cane sugar.

It appears from this report that the people of European countries have to pay a good deal more for their sugar than we do. For the years 1904-1907 the average retail price of lump sugar in Naples and Milan was 13½ cents per pound, in Amsterdam 9.4 cents, in Madrid nearly 9 cents, in Stockholm 7½ cents, in Vienna and Budapest 7¼ cents, in Paris 6¼ cents, in Dresden and Bremen nearly 6 cents, and in Brussels 5¾ cents.

The prices given are for lump sugar because that is the grade most uniformly quoted in the European statistics. This grade appears to be much more generally consumed than granulated in most countries of Continental Europe.

The Brussels Sugar Convention, which went into effect September 1, 1903, caused a radical reduction of the price of sugar in many European countries. In Belgium the fall in the retail price was 3¼ cents per pound, in the German cities 1¾ cents, and in Austria-Hungary 1¼ cents.

The Secretary gives a flattering account of the progress made in developing the beet sugar industry, and takes a very cheerful view of its future prospects. He concedes that some failures occurred among the earlier factories, but shows that the later factories have been quite uniformly successful. He says that wherever factories have been successfully operated the values of farm lands have risen very decidedly, especially lands under irrigation in the far West. He says beet culture improves the land and educates the farmer. The operation of a factory leads to the investment of capital in many industries more or less related to beet sugar production. The by-products—pulp and molasses—are fed to stock, and their use has largely increased the amount of live stock kept and fed in most factory districts.

Beet sugar factories are now in successful operation in 16 States.

Colorado leads all other States engaged in the industry, having 16 factories. In 1907 these produced 169,000 tons of sugar, or enough, if it had been passed around, to give all the people in the United States four pounds apiece.

California and Michigan follow Colorado at a respectful distance in the race for second place. Michigan has the same number of factories as Colorado, but their product is considerably smaller. California has only 9 plants, but some of the latter are very large. From year to year the production of sugar is about the same in the two States.

Utah has five factories and they are strong producers. Idaho and Wisconsin follow with four each, and there are 10 States with one factory each.

The largest factory in the United States, and one of the largest in the world, is the one at Spreckels, Cal., which is able to slice 3,000 tons of beets in a day, or 100 carloads of 30 tons each.

The oldest successful factory in the United States is the one at Alvarado, Cal., which was established in 1879, and has been making beet sugar for thirty years.

ABOUT SCARS ON HORSES.

There are thousands of horses throughout the country with scars whose owners would like to have scars removed and the appearance and value of the animal increased. It is not generally known that it is possible to remove an old scar tissue and heal with hair on and leave no blemish. ABSORBINE, however, will do the work, and detailed instructions for affecting cure are given in pamphlet "How To Remove Blemishes" which is packed with every bottle of ABSORBINE or will be mailed you postpaid upon request. Mr. L. C. Anderson of Maysville, Ky., writes under date of January 5, 1909: "I cured a very badly dew-poisoned ankle, restored new hair to an old scar by using ABSORBINE." ABSORBINE is $2.00 per bottle at dealers or sent express prepaid upon receipt of price. W. F. Young, P. D. F. 244 Temple St., Springfield, Mass.

Scalefoe

Greatest Known Spray or Wash for Scale: San Jose, Black, Red, Purple and Brown. Also a sure thing for Red Spider, Canker Worm, Moss, Caterpillars, Lice, Codling Moth, and all Insects and Bugs that infest plant life; without injury to the plants, and with positive benefit to the soil, when applied. Also kills Lice and Mites on Poultry.

This has long been the leading Spray or Wash in many sections of the country, wherever introduced. We have bought the formula and the rights for this section and are putting it out under our own brand. No article can bear the "West Coast" name unless it is the best of its kind. We guarantee Scalefoe to be just as represented.

Gallon can, 85 cents; 5 gallon can, $3.75. Price f. o. b., Los Angeles, but if not sold by your dealer will send gallon can for $1 or 5 gallon can for $4, freight prepaid by us within 200 miles. Write for price in barrels. Mix 20 parts water to 1 part Scalefoe, before using; makes it the cheapest as well as the best. Satisfaction or money back.

Trouble With Silage.

I have filled my silo with foxtail and alfalfa as per your directions in California Cultivator. I made the silage very wet. The foxtail was in the dough but the alfalfa was very immature. It is still hot but my cows positively refuse to eat it unless it is mixed with bran or shorts, and then they fall off rapidly in flesh and milk. Will you please tell me how long you left it in silo before feeding and if you had any difficulty in making your cows eat it. If so, how did you proceed to make them eat it? The silage does not seem to pack as does corn. I have taken off and hauled out several tons to get down to the good silage, but find that it puffs up and dries out about six inches deep daily, so I have left two feet standing around the outside which I expect to use for manure. This gives me a smaller feeding surface, I found that the water dried out so rapidly that I pumped 10,000 gallons more water on top of it. It is now taking a second fermentation and is pretty hot. It smells and looks like good corn silage, and is a light brown in color. But as soon as the beards are exposed to the air they harden and the cows turn up their noses at it. I expect to give it a fair trial, but am afraid I will have to haul it out to use for fertilizer, which will be a pretty heavy contract. It does not taste sour like corn silage, but has a slightly sweet taste.—B. T. B., Bakersfield.

I am sorry you are having trouble with your silage. We know, however, that if it is made according to direction that it will come out all right, for alfalfa silage has long since passed the experimental stage. Cows are often peculiar in refusing strange foods. When they do not eat they drop off rapidly in the milk flow. We mix the silage carefully if the silo is not filled solidly with one kind. If we have alfalfa silage in the bottom, then on that corn silage, or the reverse. Should we make these sudden changes the cows refuse the feed the first few days. We therefore mix the corn and alfalfa in the silo for a foot so that the change comes gradually. When we begin to feed silage the first days only a quarter silage is put out on the alfalfa hay and this is increased until the cows receive thirty to forty pounds of silage and ten pounds of hay apiece daily. They must always have ten or twelve pounds of long dry roughage with the short cut silage. We were feeding green cut alfalfa in the yards this spring and when hay making began it was not convenient to go out to the alfalfa field for the mowers were both needed in the grain hay. A portion of the land that had been put into barley was an old alfalfa field and the alfalfa had come up so that there was rather more alfalfa than barley in a portion. This was cut and hauled in. The cows simply refused to eat it because of the green barley, and dropped off in milk until they did come to eating it freely. The odd part of it all was that in February they had eagerly eaten of the green barley they afterwards refused so determinedly even to consider as food.

I fear you do not realize that the silage must be kept level in feeding it out and a level cut made each day from the surface. In filling the silo the edges are kept higher until the last and also tramped hard. This forces the packing by a process of wedging, and after the heating has passed the silage is left firm and should be handled with a scoop shovel and not a fork. The tines of the fork penetrate below and loosen it up leaving a loose surface. After the silage has been removed for the day, level it off if any irregularities show, and smooth in firmly with the back of the shovel. Do not dig into it irregularly and expect to have it keep well. This second heating should make it firm, but if it is at all loose in the silo, do not give it up, but get the men in and tramp well again. This second heating will dry out the moisture and it will surely be enough to cook the foxtails well. This silage is sweet and good. Tell those cows that they will soon be begging for it. I think often these discouraging circumstances that come up teach us our business better than if everything went along smilingly. Do not waste any of the silage, that which the cows leave give the outside horses and pigs a chance to eat.—M. E. S.

Spraying Formula.

Kindly give method and formula for exterminating insects from plants and vegetables. My cabbage is infested with insects similar to aphis that are often seen on fruit trees.—W. I. S., Orangevale.

The insect on your cabbage plants probably is the cabbage aphis. The best way to treat is to prevent it from ever getting access to the field. This may be done by giving clean cultivation to the field the season before the cabbage is planted, and then being sure that the young plants when set are not infested. When once on the growing stock, it is practically impossible to dislodge it. Spray for cabbage aphis is made in the same way as recommended in the answer about green aphis given above. As to giving a formula for exterminating insects on plants and vegetables, that would require a page or probably two pages of most condensed information. The best we can do is to refer our subscriber to our issue of March 12, 1908, containing an article which gives nearly twenty-five formulas for sprays for insects and fungus diseases, also much information on the application of insecticides.

By the way, at the head of that particular article, in large type, is the following: "Do you keep your Cultivators? If not, do so. The index every six months makes a file valuable." That one issue of the Cultivator should be worth the price of a year's subscription to many of our readers.

Wooly Aphis.

I have an apple tree attacked by insects reddish brown in color. They form in clusters on the trunk and branches, being readily seen, especially when they become covered with a white down under which they work. They do not seem to bother the foliage, but work entirely on the bark. Is it unlawful to send such specimens through the mail?—C. W. J., Laton, Fresno Co.

Judging from your description, this is the wooly aphis, one of the worst pests the apple grower has to contend with. These insects spend a large part of their lives in the ground at

HYDRAULIC PRESS MFG. CO., 123 Lincoln Ave., Mt. Gilead, O

the root of the tree, and the form which you observe ascends the trunk and proves most disastrous especially to young trees. Where the trees are valuable they should be treated at the roots by an application of gaslime, tobacco, carbon bisulphide or wood ashes. Spraying of the form which you see on the trunk, often called the "aerial form." checks their spread somewhat, but you must get at the root form if the tree is to thrive. It is not unlawful to send these specimens through the mail.

Summer Fallow.

I have something of interest to farmers. I know nothing about farming, but last year bought a small ranch one mile west of Tulare, well run down. I got a gentleman on the next farm to show me how to plow and then plowed four acres of land and kept it well cultivated, and on January 17th planted 80 pounds of wheat and 60 pounds of alfalfa. On May 10th I cut 20 tons of wheat hay and now have a good stand of alfalfa. As I knew nothing of farming, I called on Uncle Sam as my teacher, and I believe the results show the instructions to have been good, and to demonstrate that summer cultivation is the proper thing. If anyone can beat this yield, I would like to know how he does it.—F. M. L., Tulare.

As we once heard a tenderfoot, formerly an Eastern banker never on a farm, express it: "I have nothing to unlearn, so will have the advantage over the Eastern farmer who has come to California with ideas of how farming ought to be carried on."

Spraying for Scale.

My orange trees are now blooming and have the black scale. I wish to spray when they stop blooming with a certain liquid. Please tell me how long to wait so as not to hurt the young oranges.

The orange trees are very thick at the top. Would it hurt if I cut out some of the small branches?—B. P. L., Los Angeles.

It would be much safer to trim out the tops of these trees and especially clear out all dead twigs in the center of the tree so the sunlight can get in, then allow the spraying to rest until fall, or at least August. That will be time enough to keep fruit from becoming smutty next year and avoid danger of injury to your small fruit. Besides, you will probably get a greater percentage of the scale at that time than if you spray now.

Green Aphis.

I send branch of prune tree infested with lice. Is this what is called thrips, and is there any way of destroying it?—M. E. M., Ritchey.

These leaves are infested with a good liberal supply of the small green aphis which may be reached by a kerosene emulsion, a weak solution, or a tobacco tea made by boiling a pound of stems or of dust in two gallons of water until a dark brown liquid is obtained. Add water to make two or three gallons, and the efficacy is increased by adding a pound of whale oil soap to 50 pounds of the decoction. This will not harm the tenderest foliage. You can buy the tobacco extract at any seed store and simply dilute with water and spray.

Fly Paper for Worms.

Referring to reply to article on page 578 of May 13th issue, "Worms Climbing Trees," I am using ordinary fly paper now and it prevents cut worms and other insects injuring the tree or shrub. I tie it around the trunk of the tree or lay strips of it on the ground around the tree or plant to be protected.—J. J. Fitzgerald, 3212 "J" St., San Diego.

Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Poisoning Chickens.

A has a lot of chickens. B notifies A to keep his chickens off of his crops and A does not do it. Can B put out signs and scatter poisoned wheat where the chickens are destroying his crops, or what can B do to protect himself?

A, B and C are partners in a pumping plant. Can A and B compel C to sell his share in the pumping plant if it is proven that C is not agreeable? Can two partners force the third to buy or sell?—Subscriber.

B has no right to poison A's chickens, even though he gives A notice that he intends to do so and carries out his threat upon his own land.

In the city of Los Angeles by an ordinance applying only to that city, B might kill the chickens and place the carcasses on A's land without incurring liability.

There is an old state law which gives the right to owner of land trespassed upon to take up the animals and hold them until the damage has been satisfied.

The Legislature further provides that the party taking up such animal has a lien thereon for all expenses incurred and costs in keeping and caring for said animal or animals. Said animal shall be confined in a secure place, and the owner notified. At any time within thirty days from the filing of the notice, which must be recorded, the person claiming such animals may, by paying all damages, expenses and costs, recover them. The damages must be estimated as provided in the act.

When several co-tenants hold and are in possession of real property, as tenants in common or joint tenants, an action may be brought by one or more of such persons for a partition thereof, according to the respective rights of the persons interested therein, and for a sale of such property, or a part thereof if it appear that a partition cannot be made without great prejudice to the owner.

The proceedings for partition are special and statutory and too lengthly to detail in this answer.—E. L. Payne.

Hay Balers' Accounts.

What is the law or custom among hay balers for securing payment of bills where party must sell hay to get money for pressing bills? I believe such information of value to many, both customers and balers.—A Subscriber.

I am not familiar with any custom among hay balers for securing payment of bills.

The Code provides that every person who makes, alters, or repairs any article of personal property, at the request of the owner, or legal possessor of the property, or who improves the same, has a lien upon the same for his reasonable charges for work done and materials furnished, and may retain possession of the same until the charges are paid.

I do not know that this provision applies to baled hay, but think, in all probability, it does. If the person entitled to the lien be not paid the amount due and for which such lien is given, within twenty days after the same shall have become due, then such lien holder may proceed to sell said property, or so much thereof as may be necessary to satisfy said lien and costs of sale at public auction. Ten days previous notice must be given by advertising in some newspaper published in the county in which said property is situated.

In most cases the prompt attaching of the hay, or some other property of the debtor would be effective.—E. L. P.

Classified Liners

FARM LANDS FOR SALE.

FOR SALE—RIGHT IN TOWN, Oranges, Olives, Almonds; plenty other fruit for family use. Twenty acres, all in bearing. Water soft, abundant, piped through the land; turn a faucet and irrigate. Merchants Trust Bldg., Los Angeles

If your dealer cannot supply these jars, send $3, and we will express prepaid thirty (30) quart size ATLAS E-Z SEAL JARS to any town having an office of the Adams or U. S. Express Co., within the States of Pennsylvania, New Jersey, New York, Delaware, Maryland, Virginia, West Virginia, Ohio, Illinois, Indiana or Michigan, or we will quote delivery prices in other portions of the United States by freight or express.

This is the Jar That Saves You Trouble

The Atlas E-Z Seal Jar — the best made and most convenient fruit container yet put on the market.

It has a mouth sufficiently wide to take in large fruits, like peaches and pears, *whole*.

It seals by a simple downward pressure of the hand, and *when* sealed, keeps its contents perfectly for any length of time. The

ATLAS
E-Z Seal Jar
(Lightning Trimmings)

is machine-made; of extra tough glass and very strong at top where common jars so often break. Being smooth finish on the lip, there are no fine glass particles to fall into the jar, as sometimes happens when putting cap on a hand-made jar. The

Atlas Special Mason

has a wider mouth, but is made with screw cap.

Always ask your dealer for "Atlas" jars and take no substitute — then you have the best.

A Book of Preserving Recipes
Sent free to every woman who sends us the name of her grocer, stating whether or not he sells Atlas Jars.

HAZEL-ATLAS GLASS CO., Wheeling, W. Va.

Angle Lamp
The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT, soft,** steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

WHO MARCHES NEXT MEMORIAL DAY?

Who marches next Memorial Day?
Speak up, brave comrades; let men say
"The Post turns out in force this year"—
Grant's veterans, Sherman's infantry,
Sheridan's tireless cavalry,
Farragut's seadogs without peer;
Tireless and fearless in the past,
Bear yourselves proudly to the last,
Though years fly fast and death draws near.

Who'll bear the dear old Flag—the bright
Tri-colored banner, red and white
As sunset's glory, spotless snow,
On whose broad field of heavenly blue
The golden stars of statehood true
Like bivouac fires divinely glow?
'Tis but a wisp of silk; the staff
Light as a boy's slight wand. You laugh;
They seemed so forty years ago.

In joy or sorrow, for the list
Is long of loved ones we have missed
From camp and banquet, field and mart;
In ancient foray, field or fray,
And peaceful death-beds passed away,
They from our hearts were torn apart.

God give them peace Memorial Day;
Whereas His blessed Islands lay
In golden light, or purple haze,
Where deathless flowers and healing balm
For tired eyes, and holy calm
Await the brave whose fadeless bays
Crowning immortal brows reward
Heroes whose lives were given to guard
The Right, through the eternal days.

What shall we say Memorial Day?
That we tread fearlessly the way
From Manhood's prime to Age's frost;

MEMORIAL DAY.

WITH heads uncovered and with hearts attuned to grateful memories, we pause again beside the tomb where valor sleeps. With flowers and tears we voice the soul, and bow the head in contemplation of the sacrifice. And though the language of the lips be fruitless of a fitting eulogy, with words that falter and that fail the task, we strive to speak a Nation's homage to its martyred dead. Though crowding years have hurried on since these brave soldiers fell on fields of blood, remembrance knows no flight of years, and heroes' names and heroes' deeds are treasured in the Nation's heart, and others, too, who fronted danger side by side with those who fell where bullets sang, have heard the call in later years and sleep again beside their comrades in the silent camp. And others with whitening hair, are yet among us, and they gather yet, in thinning ranks, to march with tribute to the brother's grave. To all of these, the living and the dead, be highest honor and a fadeless name. Let children's children hear again the deathless story of their sacrifice; their sacred dust let no man desecrate. For in that distant day alone will patriot sons forget their deeds, when gratitude shall spurn the hand that brings a gift, and pensive memory shall forget her name.—Homer Hoch,

Who'll lead us through the crowded streets
While cornet's blare and base drum's beats
Help us to keep unwonted time
To martial strains that give new life,
To memories of those years of strife
And trial in yon southern clime;
Wherein we poured out Youth's sweet bloom
And Manhood's strength, like the perfume
That censers waste in fanes sublime?

Not the old colonel tried and true,
Nor his stout major; in review
Or march they'll lead us nevermore.
Some captain brave, lieutenant gay,
Or sergeant proved in march and fray,
Succeeds to the command they bore;
When, waking from the spell of peace,
In memories proud we felt surcease
Of pain and donned the blue once more.

In memories proud, we felt surcease
Of losses blending joy and pain;
Of gallant lives given to death
Loyally, cheerily as rain
Falls on the white-hot lava-plain
To perish in its seething breath;
In charity, to those grief-worn,
Watching in vain for the return
Of whom "Unknown" the record saith.

Who speaks for us Memorial Day?
Whose burning words shall for us say
Something that brings our lost youth near;
The hopes and aims of high emprise
That made life nothing in our eyes
And Honor more than Death or fear;
Who shall interpret for us, now
That men to gold and pleasure bow,
How love of country was most dear?

Whom shall we miss Memorial Day?
Well is it that long years allay
The burdens of the laboring heart
As in the grand, grim past we trod
The wine-press of the Wrath of God
Regardless of the pain or cost;
That still we prize o'er wealth and Power
Our fatherland, and Freedom's dower,
For which such precious lives were lost.
—Charles Winslow Hail, in May National Magazine.

BETHLEHEM.

O little town of Bethlehem,
How still we see thee lie!
Above thy deep and dreamless sleep
The silent stars go by,
Yet in thy dark streets shinneth
The everlasting light.
The hopes and fears of the years
Are met in thee tonight.

For Christ is born of Mary
And, gathered all above
While mortals sleep, the angels keep
Their watch of wondering love.
Oh, morning stars, together
Proclaim the holy birth
And praises sing to God, the King,
And peace to men on earth!

How silently, how silently,
The wondrous gift is given!
So God imparts to human hearts
The blessings of his heaven.
No ear may hear his coming,
But in this world of sin,
Where meek souls will receive him still,
The dear Christ enters in.

O Holy Child of Bethlehem,
Descend to us, we pray!
Cast out our sin and enter in;
Be born in us today.
We hear the Christmas angels
The great glad tidings tell—
Oh, come to us, abide with us,
Our Lord Immanuel.
—Phillips Brooks.

It is astonishing how much patience a man has where his own faults are concerned.

Southern Pacific

About the House

THE days are growing longer and as the warm season approaches the wise housewife provides for the family table more fruits and vegetables and fewer pies and meats. A good warm-weather dish to use instead of meat is made of rice and cheese. In a buttered baking dish, put alternate layers of boiled rice and cheese broken into small bits or grated. Place bits of butter and a little pepper and salt on the layers of rice. Moisten the whole with sweet milk and cover with a layer of buttered crumbs, and bake in a quick oven.

A good salad that is quickly made and can be used these spring days when a meat dish is lacking, is one of salmon. Mix together equal quantities of finely picked salmon and chopped celery, seasoning with salt and pepper, and moistening with vinegar. Lettuce may be used in place of celery.

A delicious cherry salad—and one good to look upon, too,—is made by carefully seeding some fine cherries and laying them in crisp lettuce leaves, garnishing with a few cherries that have been left whole on their stems. Serve with any good mayonaise. If you wish, after removing the cherry stone fill the cherry with nuts—any kind you wish.

A variation of strawberry shortcake is made by baking a sponge cake in a round pan and when cool, but not cold, cut a circle in the top, carefully lift off and "scoop" out the inside of the cake, leaving a hollow shell. Fill this with strawberries, or any other berries, that have been well sugared. Replace the top of the cake and cover with a thin white icing. Cut in wedge shaped pieces and serve with cream and sugar. The inside of the cake can be used for puddings, so there is no waste in the "hollowing out."

Did you ever boil eggs? Take off shell, lay on a round of buttered toast and cover with a hot cream sauce that has one or two yolks of eggs beaten into it and seasoned a little more than usual. It makes a palatable dish and is the "change" that we all like some times.

Speaking of new dishes, "Everybody's" tells of a new shell-fish.

"The guest glanced up and down the bill of fare without enthusiasm.

"Oh, well," he decided finally, "you may bring me a dozen fried oysters."

The colored waiter became all apologies.

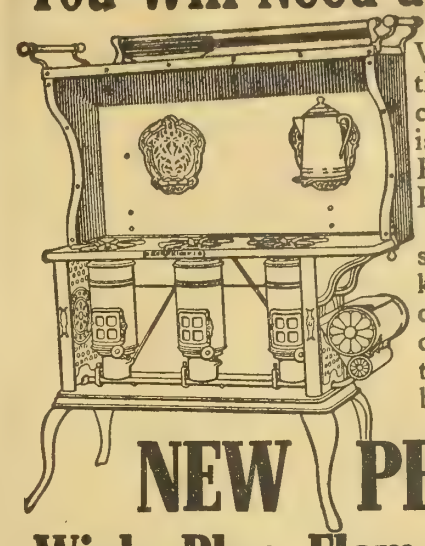
"Ah's very sorry, sah, but we're out ob all shellfish 'cepting aigs."—Elbepe.

DOMESTIC ECONOMY.

Out of our general fund my wife takes for herself and gives me, a fixed personal allowance. We each preserve that inviolate. We must dress ourselves and meet certain definite expenses out of these individual funds. If I exceed the speed limit in neckties I have to sober up until next month. If I decide to switch from $5 shoes to $7 shoes, I can do so without turning off the light that makes home happy. If my wife pays $20 for a hat I can admire the hat, and laugh over the fit of folly that drove her to such extravagance. It is no concern of mine. I know that she will have to economize somewhere.—American Magazine.

"As between a chatterin' woman an' a squeaky phonograph give me th' latter, fer it'll run down sumtime."

You Will Need an Oil Stove

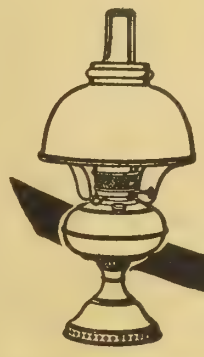


When warm days and the kitchen fire make cooking a burden—then is the time to try a New Perfection Wick Blue Flame Oil Cook-Stove.

Marvelous how this stove does away with kitchen discomforts—how cool it keeps the room in comparison with conditions when the coal fire was burning. The

NEW PERFECTION
Wick Blue Flame Oil Cook-Stove

is the only oil stove built with a CABINET TOP for holding plates and keeping food hot after cooking. Also has useful drop shelves on which to stand the coffee pot or teapot after removing from burner. Fitted with two nickeled racks for towels. A marvel of comfort, simplicity and convenience. Made in three sizes—with or without Cabinet Top. If not with your dealer, write our nearest agency.



The Rayo Lamp Just such a lamp as every one wants—handsome enough for the parlor; strong enough for the kitchen; camp or cottage; bright enough for every occasion. If not with your dealer, write our nearest agency.

Standard Oil Company
(Incorporated)

WOULD YOU LIKE TO SLEEP ON A MATTRESS

That is guaranteed to be absolutely hygienic?

Hay.

Scott & Magner say: We now find that a large proportion of the daily arrivals consists of the new crop hay, and as the hay is arriving in good condition and shows of good quality, it is being used satisfactorily by the consumers here.

However, as this period of the season is usually dull, it is not an exception to find this dull condition prevailing here in the hay trade at this time, as it is just between the old crop and the new, and at the time when all consumers are buying sparingly.

With the present slack demand and the increased shipment of hay during the last two weeks, our market has been adversely affected, has declined in prices, and at the present writing is weak at our quotations.

The shipments of old crop hay have continued as actively as conditions would permit, as the holders of old crop are very desirous of getting their stocks on hand reduced as quickly as possible, so as to take full advantage of the prevailing high prices of old crop hay.

There has practically been no alfalfa hay coming in, as the demand here at this time for this article is exceedingly light. Prices on alfalfa hay are practically nominal.

We quote the general range of prices on today's hay market as follows, viz:

Choice wheat hay .....22.00@24.00
No. 1 wheat or wheat & oat 20.00@21.00
No 2 wheat or wheat & oat 17.00@19.00

Citrus Market

LOS ANGELES, May 26, 1909.

If it were not for the excess of large size offs, the market conditions on oranges would be fairly good at this

Cream Separators, all sizes, all prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

Try this for a Big Load

The easiest running wagon or dray is the one lubricated with Mica Axle Grease.

Kills friction; stops wear; makes a two-horse rig run with one-horse power.

MICA Axle Grease

contains powdered mica which coats the axle with a non-friction surface—*that's* the *why* of it.

No grease helps as much as Mica Axle Grease.

If you try it, you'll know it.

Ask your dealer.

Management
Palace Hotel Company

time. Good fruit of the more desirable sizes is commanding fairly good prices. Even the off sizes are bringing close to $1.00 f. o. b. Shipments are materially decreasing, for instead of 1300 or 1400 cars per week as were going forward two or three weeks ago and 1100 a week or more ago, the state is now forwarding 700 to 800 cars. Probably by the first of June, the shipments of Valencias will be in full swing, and two weeks from this time will probably see all navels, Mikes, sweets, and all excepting Valencias, gone.

It is unfortunate that many oranges injured by frost are still being forwarded. It cannot be denied that the freeze earlier in the sason did very much more damage than has generally been admitted. This fact, together with the exceedingly large shipments during the past few weeks accounts for the weakness of the orange market.

Lemons are doing exceptionally well at this writing. The only embarassment now is to find a market for the low grade stuff. There are immense quantities of spring cuts which are exceptionally poor keepers and originally poor fruit. This class of fruit is begging for purchasers with poor success. If the warmer weather brightens up the market sufficiently, then the low grade fruit will be picked up at a fair price.

Shipments.

Total shipments to date this season, 26,081 cars of citrus fruits. Of these 22,779 were oranges, and 3,302 were lemons. To same date last year, 22,678 citrus fruit, for which 20,072 were oranges and 2,606 lemons.

NEW YORK, May 24.—Fifty-three cars oranges and three cars lemons sold. Market very steady on good quality fruit. The lemon market is easier and lower. Weather clear and favorable.

Beautiful Orchids at Del Monte

In the Greenhouses at Del Monte, Where a Large Number of Orchids Are Grown. Those in the Photograph Are Natives of Mexico.

Future Citizens of Kerman, California

J. W. Brooks, J. B. Deardorff, J. W. Lamb, J. W. Cook, E. M. D. Smith, C. E. Wells, C. F. Anderson and L. W. Brooks, all of Towner Co., N. D. Together they bought 220 acres of land March 18, and will help to make Kerman the richest colony in California.

Do You Know

That the east is burning up with land hunger? That productive lands are getting scarce and hence higher? Do you know that the people east are just beginning to find out that there are agricultural lands in California and hence that we are on the eve of the greatest emigration movement California has ever experienced.

Do You Know

That as a consequence it behooves all who are landless in California but who hope sometime to enjoy the blessings of a landed home, to get busy and to secure the home before the other fellow gets it, and before prices have advanced to where they are prohibitive? That the easterners who are coming here now are astounded with the agricultural possibilities of "New California?" That they are buying themselves, and then going back home spreading the news of their find, and inducing others to come?

Do You Know

That ere long the man who owns productive land here will discover its value, and will refuse to part with it at several times the amount it now takes to "lift" it, and that when that time comes it will be everlastingly too late for many.

Do You Know

That the value of land depends upon what it will produce per acre? That land on the **Kerman Tract** is today the cheapest land in the United States, value of possible products considered? That this fact is becoming known, and that it is bringing more people here than have ever come to any other similar tract in the same length of time?

Do You Know

That the **Kerman Tract** excels when it comes to water right, quality and lay of soil, natural drainage, location, and in possibilities for fruit and alfalfa growing, dairying and poultry raising? That it is unsurpassed, if equalled, in the things that go to both home and money making? That it is being populated by the very best quality of people, the cream of the country? That undesirable people are not allowed to buy land here and that those who locate are protected against the scourge which has ruined so many otherwise promising colonies in California? If you do not know these things now

We Are Telling You

And we ask the privilege of further informing you. If you are interested we would like nothing better than the chance to satisfy you upon all these points, either by correspondence or by showing you over the tract. We consider it a pleasure to show interested visitors over the colony, and all comers are accorded courteous and considerate treatment. Our circular explains in detail what is here, and it is free for the asking. Write for it, and do it now. But, what is better, come here and satisfy yourself that the **Kerman Tract** is as represented, and that you are not missing something that cannot be retrieved by not taking advantage of this opportunity now. Either write to

U.S.

OUR SIDE OF THE QUESTION

The United States Separator has built up a **reputation** for **efficiency** and **durability** that makes it the **foremost** machine from every standpoint of separator requirements.

We **prize** that **reputation** and in the changes we have made for 1909 every feature that has helped to make the United States famous as **the reliable separator has been** retained.

Every **improvement** that has been made has been made with the object of **building up** and adding to that reputation.

We have added **"working points"** and not fancy "talking points."

YOUR SIDE OF THE QUESTION

You buy a **Cream Separator,** not on account of some "fancy talking points," but because it will enable you to handle your dairy product **more easily** and with **greater profit.**

A machine that will handle more milk. That will skim it more thoroughly. That will lose least in bowl flushing and that can be kept clean and sanitary with the least trouble.

These are **your** requirements, and a trial will **convince you** that the **latest model** U. S. embodies **all** of these **essential** features, to a **greater extent** than has ever before been reached in Separator construction.

The Possibilities of Plant Improvement

By G. W. SHAW, Associate Professor of Experimental Agronomy and Agricultural Technology, University of California

This article written by Prof Shaw and read by him at the last State Farmers Institute held at the State Farm at Davis gives a vivid idea of the wealth increase of this State if the importance of seed improvement can only be appreciated. The experiment station will be well worth its cost many times over in fact—if this truth can be impressed on farmers by the experiments of the station and the setting forth of the facts as are here done by Prof. Shaw.—Ed.

IT IS doubtful if there is any one agricultural problem of greater importance to farmers than the improvement of their general and special plants, whether this be done through the introduction of higher producing varieties or the development of more productive strains from those now being grown, or through improved culture. Vilmorin, the noted French savant, who has done so much for the improvement of the sugar beet, states, that "No limit can be fixed as to the improvement which may be expected from care, thought and selection. The gains of the last dozen years may surely be taken as the forerunners of better things."

The subject is of vital commercial importance from the fact that it costs no more to grow the better sorts of farm crops than the unimproved, while the increased production due to the use of the improved seed results in an increment of profit. It further awakens in the grower more interest in all phases of crop production extending all the way from selection of seed to the marketing of the crop.

The constantly increasing extension of areas devoted to agriculture has led to a constant demand for improved sorts of plants to meet the peculiar condition of soil and climate in each new region. We are coming more and more to realize that all plants are not adapted to all sorts of conditions.

Another very potent reason for this character of investigation is resident in the constantly increasing value of farm lands on which are grown general farm crops of corn, wheat, oats, barley, alfalfa, beans, etc. The increase in the value of the lands has been such that it is urgently necessary to increase the production per acre and improve the quality of these crops in order to secure a greater return for the investment.

With the advance in botany and chemistry in their application to agricultural science and practice, the expert scientific agriculturist today if he does not find at hand plants of the desired characteristics proceeds to develop a plant to suit the conditions. It may take a period of 5, 10 or 20 years to accomplish the particular thing desired, yet how short a time is this when measured against the resulting benefits to mankind.

On account of the very large number of people interested in the production of the general farm crops in any systm of diversified agriculture, which is the only system under which soil fertility can be permanently maintained, the results of such improvement will have a very far reaching effect. The importance of this character of work is fundamental as regards the individual, the state and the Nation, because the production of such crops is the basis of the Nation's prosperity.

Those who have earnestly and intelligently undertaken the improvement of any plant for a period of ten or twenty years are unanimous in their belief that an increase of ten per cent can be expected with absolute certainty within a period of twenty years and that this can be secured at a cost of less than one per cent of the value, and in many cases at even much less. This increase in productiveness is entirely apart from that secured through the adoption of better methods of tillage, and entirely independent of the trial of new varieties from other parts of the world in which there are as great if not greater possibilities than in the improvement by selection alone, and certainly in this direction we may expect to get the earliest return.

Possibility of Securing Results.

For the improvement of already existing types two methods are commonly relied upon.

1. Variation in the plants induced directly or indirectly through environment and

2. Varieties induced by crossing different varieties or species. The former method has given by far the most important economic results, although the latter requires the highest skill of the breeders' art.

But the question comes what evidence have we to offer as to the possibilities of valuable economic results? The answer is that this lies in results which have already been obtained through the medium of independent workers and also a number of the Agricultural Experiment Stations. It is pertinent to the occasion to pass in review a few of these achievements as they have affected both the yield and quality of the product.

Perhaps the most noted of improvement in quality is furnished by the sugar beet which through persistent and continued selection and scientific grooming has been gradually developed to a delicate, high-bred pedigreed root frequently under our favorable climate carrying 20 per cent or more of sugar, this development having been accomplished from a four per cent original basis. A most striking example of the flexibility of living forms of matter when subjected to systematic and persistent selection!

The effect of this achievement has been to change the entire aspect of the world's sugar supply to such an extent that the bulk of this has been shifted from the cane to the beet root until today two-thirds of our sugar is from the beet.

The development of a high starch-content potato by Cimbals, a German, is another marked achievement in the direction of improvement of the carbohydrate ingredients of plants. In this case the yield was raised from 96 cwt. per acre to 224, and the starch content from 15 per cent to 26 per cent, that is, a production of over 58 cwt. of starch per acre. The starch yield per acre was made four times as great—a very important factor in Germany where potatoes for the manufacture of denatured alcohol distilleries, starch factories and other industrial uses are sold on the basis of starch content.

Sea Island Cotton.

Cotton has long been one of the staple crops of this country, but it is only in comparatively recent years that it has received any very systematic attempt at improvement. At the outset the sea-island cotton imported from the West Indies was a perennial unsuited to the duration of the season of the sea islands of South Carolina and Georgia, where it seldom matured fruit. Though the continued selection of seed from early maturing plants, and through better methods of culture this valuable cotton has now been thoroughly adapted to the new environment. Not only is this true, but under this painstaking work the quality and length of fiber has been increased and the proportion of seed to lint decreased.

There might be mentioned cases where a change has been brought about in the odor and color of plants and the development of relatively disease resistant strains. Further the increase of the hardness of the winter wheats has vastly extended the area over which they can now be grown.

* * *

Large Interests At Stake.

The States to which these strains are adapted produce annually more than a half billion dollar's worth of crops. Ten per cent of these is $50,000,000 and the results already secured through the liberal support of the work by the legislature in these states give a basis for the hope that through its continuance these crops can still be made to produce more than ten per cent additional, and that this can be brought about at a cost that is absurdly small as compared even with the increased values produced in a single year.

That the five or six billion dollars worth of plant and animal products annually grown in the United States can be increased ten per cent by breeding, is not seriously doubted by those best able to judge. The addition of ten billion dollars' worth of products every twenty years by re-adjusting the hereditary tendencies of our crops and animals at a mere nominal cost, is as important as the development of electrical methods and appliances, or as the perfection of systems of steel roads and public highways, or as our entire foreign commerce. If, as is believed, our plant and animal forces can have their heredity so improved that $5,000,000,000 is increased 10 per cent at a cost for breeding of only $500,000 one dollar creating $1,000, it is certainly a good business proposition to develop breeding projects rapidly and freely. The evidence shows that this proposition is every year developing into a form that can not be ignored.

* * *

One Dollar Will Earn One Hundred Dollars.

California produces annually field crops which could be improved by breeding which are now worth $75,000,000, and the area is being annually increased. To increase this by breeding to $82,500,000 without other additional expense, it would pay to use $750,000. It will certainly not take $100,000, or say $100 for each dollar of the stated increase. The state is now spending probably $5,000 in plant improvement.

California has long been noted for its liberal hand in dealing with whatever projects she determines to undertake and I feel certain that when she realizes the great economic importance of this field of operation, she will stand second to none in this line of work.

That there is need of it no one will be likely to question when the absurdly low average yield of many of our field crops are mentioned. The return for 1907 shows as follows:

NITROGEN AND NITRAGIN.

THE chemical element nitrogen takes an essential part in the composition of all plants and is especially abundant in buds, seeds, flowers, growing tips, and, in fact, in all parts rich in the living plant substance, protoplasm. Hence a steady supply of nitrogen must be obtained in the food of plants, although in this respect the plant is far less wasteful than the animal and may use the same nitrogen over and over again once it has been absorbed. The source of the plant's supply of nitrogen is almost solely from the nitrates of calcium, magnesium, potassium, and sodium which are continually being produced in the presence of the requisite bases in every fertile soil during the decomposition of its nitrogenous humus. The nitrogen of this humus is oxidized in the presence of free oxygen by nitrifying bacteria, which are present in all ordinary soils. Ultimately nitric acid is formed, usually with ammonia and nitrous acid as intermediate products, and this nitric acid combines with the alkaline bases present in the soil to form nitrates.

This process is a continuous one, and takes place most rapidly when the soil is warm, moderately moist and well aerated. It stops, or becomes very slow, if the soil is at all acid, completely dry, very cold or in a swampy, badly aerated condition owing to an excess of water.

When a soil dries up in which nitrification has been active, the nitrates may sometimes be so abundant as to form an efflorescence on the surface of the soil. Since all these nitrates are, however, soluble in water, any heavy shower of rain will tend to wash out the excess of nitrates from the soil before the roots have time to absorb them. Hence there is far less danger of loss, and a more permanent effect is produced when the nitrogen needs of the plant are supplied by the bacterial oxidation of humus manures applied to the soil, than when the same amount of nitrogen is directly applied in the form of a dressing of Chilian saltpetre (sodium nitrate).

Although the air, which contains four-fifths by volume of nitrogen, represents an enormous total amount of this element, it is not directly of use except in a few special cases. Ordinary green plants can make no use whatever of the free nitrogen of the air. It enters the plant, and is found dissolved in the sap in every part, but cannot be assimilated or used as food any more than horses can digest the sand which they often swallow when grazing. Every thunderstorm, however, and also certain slow chemical processes of oxidation like that of phosphorus in moist air cause the oxygen and nitrogen of the air to combine, ultimately forming nitric acid, which is washed down by the first shower of rain. In the same way, whenever the air contains ammonia derived from manure heaps, or from decaying animal or vegetable matter, this is washed down by the rain, and oxidized to nitric acid and nitrates in the soil.

The amount of combined nitrogen available for the plant's use, which reaches the soil in this manner, although quite appreciable, is never more than a small fraction of that removed from the soil by drainage and by the crops. Under the most favorable circumstances it does not represent more than a tenth or twelfth of the annual loss of nitrogen from a well-drained, cultivated soil with an average rainfall, and is usually considerably less.

Certain organisms exist, however, in most soils which have the power of assimilating the free nitrogen of the air and ultimately enriching the soil with combined nitrogen available for the plant's use. The most important of these organisms is Clostridium Pasteurianum, an anaerobic bacterium, which is unable to exist in ordinary soils unless supplied with free nitrogen and unless associated with certain other micro-organisms. The latter shield it from the oxygen of the air, which is poisonous to this organism. If all the required conditions were fulfilled, soils containing this bacterium might gain from 20 to 30 pounds of nitrogen (equal 120 to 180 pounds of sodium nitrate) per acre per annum. As a matter of fact, the actual gain due to the presence of this and similar micro-organisms appears usually to be comparatively small, partly because the conditions are rarely the best possible and partly because denitrifying bacteria are usually also present which set free the combined nitrogen of the soil and may in some cases cause a loss instead of a gain to occur. In addition, the conditions which favor the fixation of nitrogen by soil bacteria not dependent upon leguminous plants are, in general, not the most suitable ones for the development of ordinary crops.

It is well known that leguminous plants differ from ordinary ones in having the power of assimilating the free nitrogen of the air, and hence can exist on the poorest and sandiest soils where nitrates are practically absent or very deficient in amount. They have, however, this power only when peculiar tubercles are developed on their roots which contain nitrogen fixing bacteria derived from the soil or originally present on the coats of the seed. These root tubercle bacteria penetrate the young roots and there give rise to tubercular swellings, in which the bacteria are nourished and carry on the assimilation of free nitrogen for the benefit of the plant bearing them. If the root tubercles are not formed, then leguminous plants are as dependent upon supplies of combined nitrogen (nitrates, etc.), as are ordinary plants, so that whenever a leguminous crop, which usually does well on a particular soil in the absence of nitrates, fails to grow well, the first investigation to make is to pull up some of the plants and see whether the failure is due to the absence or deficiency of root nodules. In this connection it must be remembered that the use of nitrates as manures tends to suppress the formation of the root nodules, since these are then less necessary.

If a leguminous crop fails owing to the non-formation of root tubercles, it may succeed if the necessary bacteria are supplied to the soil or young seedlings. The root tubercle bacteria appear all to belong to a single species, Bacillus radiciola, but several varieties grow on different plants and these are not mutually interchangeable. Thus, the variety from the pea will infect the bean, but not clover. The soja plant of Japan usually forms no tubercles in Europe although they

are abundantly produced in Japan, where the appropriate variety of bacterium occurs. In such cases, the bacterium may be supplied to the soil from a plant of the same kind as that which is to be grown, by crushing its root tubercles to a thin paste with cold water and either spraying the diluted mixture over the land or soaking the seeds in it before planting. A single large root tubercle may contain several million bacteria, and only one bacterium is needed to start each fresh root tubercle, so that the root tubercles from a small number of plants would be sufficient to infect an acre of soil or several bushels of seeds. Once added to the soil they appear, however, to die out before long in the absence of an appropriate host plant, so that the direct application to the soil usually involves considerable waste and may be quite ineffective.

Cultures of nitrogen fixing bacteria, usually termed nitragin, (a very unfortunate term well adapted for booming a commercial product, but highly confusing to farmers since "nitragin" is the phonetic spelling of the chemical element, nitrogen, as customarily pronounced, and all farmers now realize the importance of nitrogen in plant nutrition) have been placed upon the market and extensively boomed both for direct application to the soil and to the seeds before planting. These cultures are only effective when they contain the particular variety of bacterium required, and they are no better than the material which can be derived directly from the root nodules. The cultures soon lose their efficacy, and in many cases have been shown to contain none of the required bacteria at all.

In fact, in certain cases, unscrupulous persons have taken advantage of a useful scientific discovery to make money by palming off worthless rubbish upon farmers eager to adopt scientific methods. It cannot be too strongly emphasized that no heavy outlay for a supply of "nitragin" is justified unless the farmer:

Firstly, is unable to grow certain leguminous crops satisfactorily, even in the presence of lime, potash and phosphoric acid in sufficient amount in the soil.

Secondly, finds by direct observation that this is due to the non-formation of root tubercles.

Thirdly, is unable to procure a supply of the same plant-bearing living root tubercles which can be directly used for infecting the seed or soil.

Some of the forms of "nitragin" have been supposed to contain the bacteria which live freely in the soil and enrich it with nitrogen. This is probably a misstatement. In any case, the use of such cultures would not be profitable, because these soil bacteria are usually present in all soils capable of maintaining them, and when added to a soil from which they were originally absent, they usually rapidly tend to disappear again.

Further, the net result of the activity of soil bacteria in rich, well-manured soils is to produce a loss rather than a gain of nitrogen, and hence no advantage is to be expected by the addition of cultures of any kind of bacterium to such soils.

To sum up, in the present condition of our knowledge, the use of "nitragin" in agriculture is not at present to be recommended except under very special conditions. Even then the same results might be obtained by the far better and cheaper methods indicated above,—Journal of Agriculture of Victoria.

EXPERIMENT FARM OF OUR OWN.

While it is a fact that in an unbalanced soil the use of a single element of plant food alone sometimes proves more profitable than a complete fertilizer on the same land, it is also certain that soon the unsupplied elements must become exhausted and a different one (if any one) will become the most profitable to use alone.

Now in order to obtain a practical and intelligent guide in his fertilizing operations would it not be just the thing for each farmer and grower to operate each year on his own land an independent experiment farm on a very small scale, to determine the fertilizer materials to use with most profit the year following?

Instead of making a big and expensive guess every year, to be possibly disappointed in the harvest, it would seem far better to make a number of small guesses at one time and by a comparison of the results, to know just what the land needs and what will render back the largest amount of cash for the smallest outlay.

It appears to the writer that by such a course the uncertainties of guesswork and theoretical conclusions will be largely eliminated.—R. R. Snowden, Los Angeles.

WALNUT BLIGHT REMEDY.

THE following communication from Dr. William R. Lee, of Los Angeles, treats of a remedy, or rather a preventive of walnut blight. The cleaning up of rubbish and leaves looks reasonable and the ground burning or heating may be effective if followed by all, but whether it is practical may be questioned.

Mr. Lee says:

Desiring to give the utmost publicity to a remedy-process for walnut "blight," thrips, and other tree pests of similar habits, that I suggested a year ago, I submit the details.

In walnut blight, in the fall and early winter, after the nuts have been harvested, the blight germs are found in the old infected nuts, twigs, and leaves; and in the top layers of the soil. By gathering the trash up, with a rake fine enough to bring in the nuts, and burning it, you get a large percentage of the germs.

By following this work with a surface burning, using a weed burning machine, you kill every living thing in the top two to four inches of the soil. Cutting infected small branches back to healthy wood, pays to a point where the cost of the pruning gets too high. As all soils do not heat equally fast, a test should be made on a side strip of each grove.

Care should be taken going over the roots, that it does not burn too deeply. This process sterilizes the top two or three inches of the soil, but the cost of fertilizer to refill it is not prohibitive. The work should be started on the windward side of a grove, to avoid reinfecting cleaned ground.

The best work is done in the fall, just after the nuts are harvested, and before the rains start.

There is a difference of opinion about the life habits of this bacterium in the spring months, but a surface burning in the spring is almost certain to be of value.

If thorough work is done the first and second years, the subsequent treatments will cost very little. In fact the two year's treatment will almost certainly clean the grove, unless it is surrrounded by infected, untreated trees. There are two machines in the market, one costing $125.00 and freight, the other $500.00, one burning gasoline, the other crude oil. Where neighbors can join in standing the expense, the cost is much less.

In the case of thrips, if this insect is as migratory in its habits as experts say it is; anything less than a general treatment, of a whole country side, is certain to fail of success. But there is a time, in the spring months, when most of the insects are just at the surface, or just under the surface of the soil. Then a thorough burning of the soil, with one of these weed burners, will kill a large percentage of them. As there seems to be a tendency in insects to get discouraged when persistently fought, this treatment, combined with any other suggested, will save many orchards. As in the case of "blight," the soil will be sterilized, but can be fertilized again.—William R. Lee, M.D., Los Angeles.

DIGESTIBILITY OF NUTS.

With the exception, perhaps, of certain rich pies and puddings, no food material has the reputation for indigestibility that has been accorded to nuts. Discomfort from them is certainly not uncommon, and when it occurs it seems fair to say is largely due to insufficient mastication and to the fact that nuts are often eaten when not needed, as after a hearty meal or late at night; though it is undoubtedly true that nut protein as ordinarily eaten is not so easily or so completely digested as meat protein. Very likely the concentration of nuts, with but 3 to 5 per cent water, as compared with meats containing from 50 to 70 per cent water, is a contributing cause. If careful consideration were given to this matter and if attention were paid to the proper use of nuts and their correct place in the diet, there would be less unfavorable comment on their digestibility.

The results of investigations carried on with fruit and nut diets at the Californiua Agricultural Experiment Station afford tentative conclusions regarding thoroughness of digestion which should be of value to those who wish to use nuts as a staple article of food rather than as an occasional article of diet. This work has comprised 15 dietary studies and about 100 digestion experiments with elderly men, young men, women and children, of whom some had been vegetarians for years, and some had even limited their diet almost exclusively to fruit and nuts; others had previously lived on the usual mixed diet. The average coefficients of digestibility reported for 28 experiments with two men and one woman on a fruit and nut diet were: Protein 90 per cent; fat, 85 per cent; sugar, starch, etc., 96 per cent; crude fiber, 54 per cent; and ash, 68 per cent, with 86 per cent of the energy available. The corresponding figures for three experiments with the same subjects in which no fruit or nuts were used are: Protein, 94 per cent; fat, 92 per cent; sugar, starch etc., 96 per cent; crude fiber, 49 pe cent, with 88 per cent of the energ available. The latter coefficient agree very closely with those in th average of nearly 500 experiment with different sorts of mixed diet namely: Protein, 92 per cent; fat 95 per cent; and carbohydrates, 9 per cent.

Nuts were the main source of pro tein for the fruitarians, and it wil be noted that this constituent ha practically the same coefficient of di gestibility in the nut and fruit diet a in the other cases cited. The studie with fruitarians have all indicate that nut protein is fairly well assim ilated; and that this is true with th average healthy person is well illus trated by an experiment with a uni versity student, who, though entirel unaccustomed to such fare, gradually changed from an ordinary mixed die to one of fruit and nuts, which he fol lowed for a time without apparen loss of health or strength.

It is somewhat difficult to arrive a definite conclusions regarding the act ual percentage of nut protein digested or assimilated. The experimental data obtained at the California statio show a range of 75 to 82 per cent di gestible protein when fruit and nut were eaten together, but the figure for nut protein is doubtless higher These coefficients were in all prob ability influenced by the fruit protein which has been found to be less di gestible than the nut protein. The di gestibility of protein in 28 experiment with mixed diets, to which were adde fruit and nuts, averaged 90 per cent.

As fruits, with the exception of th avocado and olive, yield only a smal amount of fat, the fat which is con tained in a fruitarian diet must b very largely obtained from the nuts The average coefficients of digestibil ity for this nutrient in 30 experiment with men on a diet of fruit and nut was 86 per cent, and in 28 experiment just referred to it was 85 per cent These figures are about 10 per cen lower than the average coefficient fo digestibility of fats in the ordinary mixed diet. The digestibility of th carbohydrates in nuts, so far as th available data show, is about equal t

that of the same ingredients in other foods.

So far as can be ascertained no experiments have been made on the ease or rapidity of digestion of nuts. In the absence of such data it is fair to assume that within reasonable limits the finer the state of subdivision of the food material the easier, the more rapid, and perhaps the more nearly complete will be the digestion or assimilation, presupposing, of course, that the nuts are not eaten in addition to a hearty meal. Too much stress can not be laid on the necessity of thorough mastication of nuts. This is emphasized by the results obtained with one of the subjects at the California station, a man at moderately active work, who ate largely of nuts but did not properly masticate his food. The coefficients of digestibility of the food were far below that for other subjects who chewed their food thoroughly. The experiments with fruit and nut diets in general indicate that nut protein is as easily, even if not quite so completely, digested as protein from bread and milk.

The present discussion refers only to the nuts included in the studies at the California station, viz, the almond, Brazil nut, cocoanut, peanut, pecan, pignolia, and walnut. It is believed that these are typical of the ordinary edible nuts, but further digestion experiments are much needed for the purpose of testing some other nuts.

As regards the work of other investigators, both Memmo and Merrill report digestion experiments with cooked chestnuts. Memmo's subject was a farm laborer, 53 years old, working eight hours a day. The experiment lasted four days. During the first two the food consisted exclusively of chestnut products. This was modified during the last two days by the addition of herring and cheese. In this experiment 75 per cent of the protein, 87 per cent of the fat, 97 per cent of the total carbohydrates, and 83 per cent of the ash were assimilated. The last figure is exceptionally high; the others correspond to those reported for the California experiments with men on a fruit and nut diet.

The subjects of Merrill's experiments were two men aged 23 and 34 years, respectively. A mixed diet was used. Each subject consumed daily 300 grams of the cooked chestnut flour, which furnished about 20 per cent of the proteids, 50 per cent of the fat, nearly 50 per cent of the carbohydrates, and not far from 40 per cent of the total fuel value of the food. The average digestion coefficients obtained for chestnuts with the two subjects were protein 56 per cent, fat 63 per cent, and total carbohydrates 98 per cent, while 89 per cent of the energy was available. Memmo also studied a kind of acorn bread eaten in Italy, and found it was fairly well assimilated, though not very palatable. In experiments made by Saiki at Yale University chestnuts were added to the diet to obtain data regarding the raw chestnut starch, and it was found that it was comparatively indigestible. This would suggest that it is desirable to cook chestnuts rather than to use them raw.

From the foreging it would appear that, while it is not possible to determine the exact digestion coefficients for all nuts, enough has been done to indicate their high nutritive value and to show that the human system can assimilate a very large proportion of the nutriment contained in nuts when they are rationally eaten.—Prof. Jaffa of California University in Government Bulletin 332.

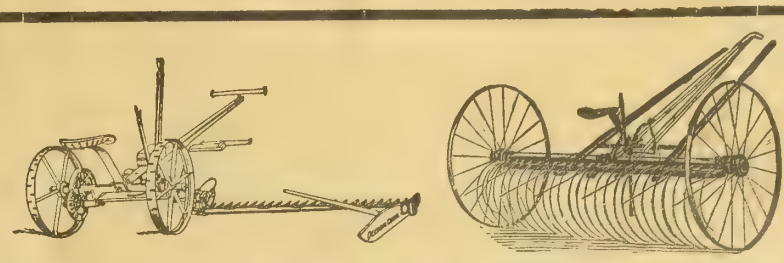
SPRAYING FOR CODLING MOTH.

Spraying just after the blossoms fall fixes the apple trees for a month or even six weeks before the earliest codling moth larvae appear but the poison put into the calyx cups after blossoming time remains there throughout the season and is as effective the day the apple is picked as it was the day it came from the nozzle cup. The final worminess of the fruit will be in proportion to the amount of spray placed in the calyx. When spraying is done with a mist nozzle of the Vermorel type, or with low pressure, or with a stream directed into the air to fall into the blossoms by gravity, it can be safely asserted that the blossoms will not be filled with poison. When the fluid is forcibly shot down as a coarse, driving spray, penetrating into the interior of the blossom, such as is done by spraying from a power machine under 200 pounds pressure we can safely assert that the cavities will be filled. When a mist spray is used fifty per cent of defective apples are wormy at the calyx end. When a high pressure spray is driven through Bordeaux nozzles, the calyx infestation has been reduced to twenty-five per cent. When the nozzles are fitted with a crook so that the spray can be shot down, the infestation at the calyx has been reduced to less than five per cent. When in addition to this, the power is used, so that the uppermost blossoms are filled with poison as well as those in the lower part of the tree, not one apple has yet been found wormy at calyx end.—Denver Field and Farm.

INTERESTING HISTORY.

A bit of history that is as fascinating as a novel and, at the same time, most instructive as to the conditions which have prevailed in the Imperial Valley for the past few years, is given in an article under the title of, "Born in the Desert" written by C. R. Rockwood, engineer in charge of the great Imperial irrigation system. Mr. Rockwood details interesting points from the discovery of Imperial Valley, and the early appreciation on the part of a few of the great possibilities there, and gives in outline the work which accomplished the great results, and also the financial troubles which have followed the great enterprise from its inception. The article covers many pages in a special edition of the Calexico Chronicle.

The company has faced many difficulties in the past, and it seems that it will have to meet more in the future, for ever since the work of controlling the Colorado river after its break of three years ago, the differences between the company and the Southern Pacific are such that even yet no one can say what the results will be, but sure it is, the water which has changed the desert to a most productive land has been secured and improvements made which can never be taken away from the valley.



Seasonable Goods

Of special interest right now, are our Harvesting Machines, Hay Tools and Hay-Presses. We have made it our business to get hold of the best in these lines. We especially call attention to the following:

Deering Ideal Mowers; perfect shear-cut, ball and roller bearing—nothing better made.

Deering Ideal Self-Dump Rakes; with ball bearing wheels; strong, durable—first class in every particular.

Dain Buck Rakes and **Stackers;** scores in use in Southern California. They are built right and will positively carry the teeth off the ground when heavily loaded. Power lift—easy to operate.

Southwick Hay-Press—without question the best horse-power press made. Many of our customers have averaged 30 tons per day or better for entire seasons' runs. We also have the Sandwich Engine power Belt Presses—of wonderful capacity. Smaller Presses, too—all steel, self feed.

See us or write us today.

Pictures Against Talk

NO matter how complicated his cream separator, every "bucket bowl" manufacturer claims his machine is simplest and easiest to clean. Even the makers of disk machines—with 40 to 60 pieces inside the bowl—make the same claims. Yet none of these "bucket bowl" fellows dare put pictures of their separator bowl parts into their advertisements—they all realize that pictures would make their claims ridiculous.

One pan contains the single little piece used in Sharples Dairy Tubular bowls. The other contains nothing but disks from a single "bucket bowl." Which is simple and easy to clean?

The Sharples Dairy Tubular Cream Separator is, without exception, the **only** simple, sanitary, easy to clean separator made. We put pictures against "bucket bowl" talk. We frequently show you pictures of the light, simple Dairy Tubular Bowl and of heavy, complicated "bucket bowls." Compare them. They tell the whole story. It will take you less than thirty seconds to put "bucket bowl" claims where they belong.

The self styled "original maker of disk machines" is trying to maintain sales by patent infringement suits against equally cheap machines, that have been made for several years with disks like his. If you want to avoid work, expense and dissatisfaction, get a Sharples Dairy Tubular. Made in the world's biggest and best separator factory. Branch factories in Canada and Germany. Sales greater than most, if not all, "bucket bowl" separators combined. Write for catalog. No. 260

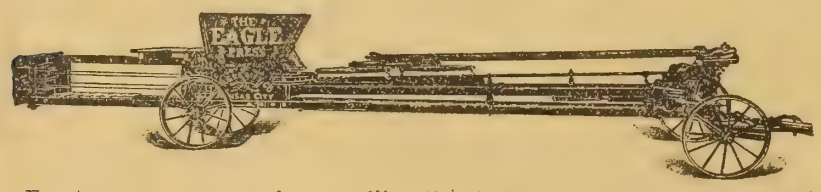
Hay Presses



Fourteen years ago we began selling the **Eagle Hay Press.** During this time we have sold over 600 of these presses, and as near as we can learn there is not a second hand Eagle Press for sale today. This, we believe, is the best hay press record of any make sold on the coast. The press, as made today, is, without a doubt, the strongest, best and longest lived press on the market. The question is: Will it pay you to experiment when you know that you can get a tried, and not found wanting, press.

A word in favor of the **Columbia Ann Arbor Belt Power Hay Press:** Three years ago we started to sell these power presses. We now have in the field, and orders written up which will go into the field within the next ten days, 34 of these presses. Last year one of our 17 x 22 steel frame power presses bailed 3800 tons of hay, and averaged a little over 53 tons per day. This is a record that we can assure you no other press has ever made in this territory, or anything near it. If you are a friend to yourself you will thoroughly investigate the power hay presses before placing your order for a press with anyone. We court the closest investigation, as we have the conclusive evidence that we have what you are seeking. You will find us at 110-112 North Los Angeles St.

Live Stock and Dairy

By Mrs. Minna E. Sherman

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

SPRING CLEANING.

THE barns and stables should be clean by this time of the year, with whitewash on fences and on the outbuildings, giving them a clean, cool look. The Spanish people, with the lime brush in constant use, make even old shacks look neat. The old stumps and pieces of logs that cannot be readily handled for firewood will burn if they are set on fire while the Spring winds blow. The attempt at a State law to enforce the removal of manure at least every other day from the cow barns was good in more ways than in actually removing the odor; it did away with the fly. The farmers around the large cities of the East are complaining that the available fertilizer is being largely cut off from the town stables by the use of coal oil on the manure piles. It is odd how every improvement that comes into life strikes some one financially on the by-products. The breakfast food men have raised the prices of the former wastes of the mills until the cow feeders find the cows in need of the meals at living prices. This alone should bring the price of milk much higher. Now each year comes the added expense for tuberculin testing, if the owner is fortunate enough to have none of his heavy producing cows condemned.

Clean Barnyards.

The impossible expense of paving a barnyard makes it necessary to be careful to have it well sanded. Every day the manure hauler should take up the droppings carefully from the ground and load them on to his wagons. The ground should receive a cating of fresh earth frequently. This expense is met by the increased value of the manure hauled out, for the urine is available at once as a fertilizer. The sand is taken up a little at a time and goes out with the manure and gypsum to the fields. The manure is spread out lightly over the ground and the sunlight soon purifies the mass. The flies are destroyed and no more breeding takes place as soon as the moisture is dried up. It seems as if most of the troubles of a farm come after all from lack of system and lack of money. I was reading of the farming of the New York millionaire, written, of course, by a newspaper man without farm experience. He spoke with contempt of the ordinary farmer not making money at farming while these millionaires could make farms pay. It was the old story over again that money makes the mare go. These rich men could buy the best of stock and then buy for cash the best of feed for them. Then there was money in it, plenty of money. There is nothing that will breed money as fast as money! I have farmed with money and I have farmed on credit, and I know the interest paid the bank is only a fraction as compared to the losses sustained by not being able to buy for cash, and at the time of the lowest prices, the necessary things for the ranch.

Flies.

The intense disgust that we have for flies in our food is well founded in the mischief they play with the health. These natural instincts are often made the subject of jests, but nature puts them there. Children are considered as untrained little savages when they shrink from the hump-backed or club-footed child in the school. Yet nature wishes to wipe out deformity and puts the instinct into the human heart to prevent the increase by marriage with the unfortunate, ill-formed person. The children have to be taught "to be sorry for deformity of all sorts." Flies fortunately, as far as we know, have no feeling to be considered and may be destroyed, for even the humane society does not protect them. Flies breed in the cesspool and in the manure piles, therefore flies are filthy. They have most interesting little feet that carry in them germs, microbes or bacteria by the hundreds. They like our food and light on it, often using it as a mat to clean off their little feet. We eat it and take our chances of the disease germs starting to work in our systems. In other words, we await the coming of a "mysterious Providence" to carry us to our graves by typhoid fever, diphtheria, tuberculosis and perhaps a score more of diseases. Removing the manure piles promptly and screening the cesspools will decrease the flies. Have covered pails for kitchen wastes, and if no other disposal is possible, burying under six inches of earth will keep the flies from breeding there.

Disinfecting.

The importance of disinfecting the house after any member has had a grippy cold is overlooked in the homes of people otherwise careful. As an instance in point, a family last March had a series of colds running through a number of days, attacking father, mother and three children. The cases were not severe and after two weeks all were well. Suddenly a two-year-old child had a convulsion, then a high fever beginning on Friday. By Saturday the doctor said cerebro-spinal meningitis and applied the serum cure. The child not improving, the spinal fluid was drawn and the micrococcus was discovered to be that of pneumonia and not the usual one of cerebro-spinal meningitis. The serum was not curative for this organism, and the little child died on Sunday. The grippy colds in the family were probably the cause and, the child having been previously weakened by the first attack, became reinfected with the germ and died.

Formaldehyde.

After every sickness this should be used to disinfect, as well as twice a year to keep the house sterile. The fumes will reach where the soap and water cannot go. Buy a pint of 40% solution of formaldehyde and half a pint permanganate of potassium. After stopping the cracks of the doors with cotton, open wide all closets and spread out the clothing to the fumes, for it will not discolor or destroy the most delicate fabrics. Put into the room a pail holding two gallons of

water, put in the formaldehyde and then the potash. Go out quickly, shutting the door closely and putting a rug against it. These fumes are irritating to the throat, but not deadly. After twenty-four hours throw the room open and let it air out. On the ranch, in the men's house there are every year a host of friendly insects that the men do not regard as deadly. These can be destroyed in this way and then the walls whitewashed and the floor given a coating of crude oil and gasoline mixed half and half.

This will render them sterile. We often mix in with the crude oil and gasoline dry venetian red or red iron coloring and give the roofs a coating to destroy moss on the shingles.—M. E. Sherman.

THE STABLE.

Barns or stables are usually needed to protect animals against rigor of climate. They should be on well-drained soil, never over manure pits, of simple construction that they may be easily kept clean, well lighted and well ventilated. Animals that are confined in stables should have plenty of room. Avoid placing a large number of animals together, as they do not do so well as when separated in smaller numbers. This is particularly true of swine and chickens. For these animals it is better to use small portable houses that can be moved to new locations, and to keep only a small number in each.

Cement is now used extensively in stable construction. For horse-stable floors it is too slippery and too hard for the horses to stand on when they are kept much of the time in stables. Animals should always have clean, dry floors.

Stables should be cleaned carefully daily, and disinfected thoroughly at least twice during the winter season,

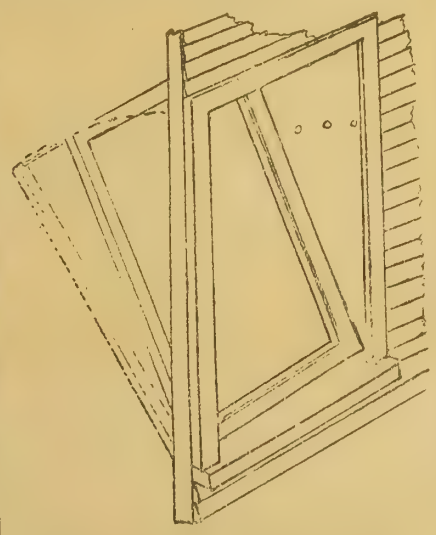

Fig. 127. Sherringham window from outside.

and always after a case of disease among the animals in the stable. For disinfecting, a five per cent. solution of carbolic acid (poisonous) in water is good (one part of acid mixed with twenty parts of water).

Lighting.

Stables should be well lighted and so arranged that the light will not strike the animals directly in the eyes. Light is best admitted from above and behind the animal. An excellent method of admitting light is by means of the Sherringham window shown in Fig. 127. The window is hinged at the bottom and opens inward at the top, and serves for ventilation as well as light. Abundance of light for stables is important hygienically, as direct sunlight destroys many germs, is a good drying agent, and adds a cheerfulness that is greatly to be desired.—From Cyclopedia of American Agriculture, L. H. Bailey, Editor-in-Chief. Reproduced by permission of The Macmillian Company, New York.

Another Infringer Nailed

SHARPLES SEPARATOR CO.

John Deere Plow Co. & Deere & Webber Co.

Sued For Infringement Of DE LAVAL DISC Cream Separator Patents

For the information and caution of all whom it may concern announcement is made that THE DE LAVAL SEPARATOR CO. has brought suit in the UNITED STATES CIRCUIT COURT against the SHARPLES SEPARATOR CO. for infringement of LETTERS PATENT NO. 743,428 by the manufacture and sale of cream separators containing DISC bowl construction covered by the claims of said letters patent.

And that similar suits have been or will be filed as quickly as possible against the JOHN DEERE PLOW CO. and the DEERE & WEBBER CO., who are jobbing such infringing SHARPLES separators to dealers in the Western States.

Attention is pertinently called in this connection to the recent hypocritical advertising tirade of the SHARPLES concern against DISC separators. We have known for some time that they were getting ready to bring out a DISC machine and thus moving up in line with more modern DE LAVAL imitators and would-be competitors. We have but now, however, been able to obtain one of these new DISC machines and the necessary evidence of infringement. The facts speak for themselves and require no further comment.

In addition to the above suits the DE LAVAL COMPANY now has infringement suits pending against the STANDARD, IOWA, PEERLESS and CLEVELAND Separator Companies and the Wm. Galloway Co., all covering the manufacture or sale of INFRINGING DISC SEPARATORS, which infringement applies equally to machines being made by different ones of these manufacturers and sold under their own and various other names by several "mail order" and other concerns as well as to EVERY USER of any such infringing separator bought of ANY of these parties.

To avoid any possible misunderstanding and dispel the pretense of some of these concerns that their machines are similar to the DE LAVAL it is proper that we should add that none of the patents sued upon involves the DE LAVAL "SPLIT-WING" FEEDING DEVICE or its combination with the IMPROVED DISC construction utilized in the up-to-date DE LAVAL separators and that none of the machines is in any degree equal in efficiency, all-around practicability and durability to the IMPROVED DE LAVAL machines of today.

We have for years patiently stood the appropriation by would-be competitors of abandoned, discarded or patent expired DE LAVAL inventions and types of separator construction, but have now determined to put a stop to the more brazen utilization of LIVE patents.

There are STILL OTHER infringers of DE LAVAL patents who will be held accountable in due course.

The Ornamental Garden

GARDENING—ITS ARTISTIC PHASE.

SHALL true progress be accredited to any pursuit that does not smack of the laws of esthetics? Prune out or neglect the beautiful in life and we have only existence. Cite a man or woman who is progressive and we find one who loves the beauties characteristic of his or her occupation. Every gardener is an artist—a good one or a poor one. The poor gardener works as hard, if not harder, than the one who maps out and does his work with precision. The good gardener improves the gray matter of his brain by thinking ahead of his steps; the poor one looks back upon his random furrows with vague feelings of dissatisfaction—a subtle sense that nothing is done exactly right.

As the color artist knows where to lay on a lighter or deeper hue to bring out the perspective, so the garden artist knows the spots where to insert the various seeds that shall make the whole tract abound with the fulness of fruit and foliage. He knows what scope of fallow ground has been depleted because of his knowledge of nature of the crop which grew upon it the preceding year. He touches every spot with his seed brush in a manner that will make his summer landscape beam with richness and beauty.

The tools of the garden are simple, few and inexpensive. I am not saying this in the especial interest of the manufacturers of garden tools; the prime interest is in the reader who may not find his garden work pleasurable and profitable. No person who has a quarter acre or more of garden can afford to do without a drill for radish, lettuce, beet, onion, spinach. Where it requires several hours each day for several days to plant so large a garden without a drill, it can be done far more satisfactorily with one in a few hours.

Wheel hoes are the co-partners of the garden drill. They are made with single or double wheels to suit the taste of the user. Double wheel hoes straddle the row. There is no other device that can follow so well those tiny dreams of rows reminding one of so many gossamer threads spanning the garden of a dewy morning. It does its work, and that well. It stirs every inch of surface soil, throwing it slightly away from the baby plants, and produces that dust mulch so effectively used for the conservation of moisture in "flat" culture. One can tend almost the whole family garden before breakfast with a wheel hoe, and the result is a pleasure, saying nothing of the valuable method of gardening he is master—master of weeds, master of method, master of the whole situation. Before the cycle of another week he becomes anxious to get into that garden again. Reversing his hoes, he "thrusts" them along leisurely, intercepts the growth of menacing weeds and throws the soil gently toward his plants, which by that time have grown to vigorous youngsters. The uses of the wheel hoe, with its various attachments, will readily occur to any one who is energetic enough to buy one. With the use of the vine guards bunch beans even may be tended and "laid by."

But how are those straight, dream-like rows to be obtained? With a garden line costing ten or fifteen cents. Stakes of any size or length may be had of almost any general store. Two smooth steaks each two and one-half or three feet in length, graduated to two-inch and one-foot scales, attached to the line make a complete laying-off guide. With the drill marker down and the first row sown by the line, four or five more consecutive rows may be drilled before resetting to correct any slight bends that might be developing in the rows. It takes no more time to drill a straight row than it does a crooked one. Straight rows are more easily tended and there will be a space gain sufficient for several additional rows at the finishing, a clear gain. When the drilling for the day is over the line should be wound up and placed in dry quarters to await subsequent service.

With a plow for furrowing and opening middles, two common hoes of different width for emergencies, a trowel or two and some weeders, the gardener's outfit is nearly complete. Twelve to fifteen dollars will buy it—an A 1 investment for the fellow who means to use and take care of it.

It has pleased God to create things symmetrical and beautiful. All life that He has created, to my mind, tends always toward a higher ideal through selection and culture. Aside from the virtue of economy and the execution of methods producing abundant results, there should dwell within the heart of the tiller the satisfaction of having rendered service beautiful.

Turn the soil, mellow it, let in the air,
Stir it and free the dark mold;
Open the furrows with deftness and care,
Lay in the sleep elves of gold;
Fold the earth over their moist, loamy bed,
Firm it down gently and true—
Warm them, oh! Sunshine, wake each sleepy head,
Feed them, oh! Silvery Dew.

Long did they lay on the dark attic shelves,
Back from the dampness and cold,
Housed in the shelter of other sleep elves,
Waiting till Winter grew old;
Open the furrows, make each tiny bed,
Fold the earth over them true—
Warm them, oh! Sunshine, wake each sleepy head,
Feed them, oh! Silvery Dew.
—Farm and Fireside.

BULBS AND HOW TO GROW THEM

The summer flowering bulbs require little attention after planting.

Many of the beautiful dark-colored cannas produce both fine foliage and flowers.

The most brilliant and gorgeous of our summer flowering bulbs are the gladioli, and these should be planted out in the garden at intervals of two weeks from January until the middle of July, thus securing a succession of bloom for the most of the summer.

The tuberose and tigridia are both beautiful summer flowering bulbs that can be planted where they are to grow.

In buying bulbs it is true economy to buy the best, securing them of florists who have them in proper storage.

Their flowering period may be hastened or retarded at will, thus timed for special occasions or for a succession.

The chief reliance for this purpose, either in professional or amateur culture, centers in the various classes of hyacinths and narcissus, and the list is being yearly extended by new varieties.

Bulbs should have a rich, mellow soil of garden loam, sand and fertilizer. This soil should be prepared some time before, as fresh fertilizer causes rapid and unhealthy growth and often decay.

It is important that your bulbs should be planted as soon as possible after they are received, as the moisture which they contain evaporates rapidly, and with it goes much of their vitality.

In planting the bulbs see that both ends of the bulbs are sound. If either end is unsound the bulbs will not grow, as the plants sprout from one end and the roots from the other.—Farm World.

SPRING SPRAY

for Fruit Trees, Ornamental Trees, Vegetables, Nursery Stock, Garden Plants, Berry Bushes, Hops, Vines, etc., use

"SPRA-MULSION"
[Spray-Emulsion]

Contains dissolved petroleum oils, gives immediate and permanent emulsion with water. No oil separates on standing.

Small Fruits and Vegetables

FERTILIZING SMALL FRUITS.

Soil management for the fruit crop requires geater care and closer oversight than for other farm crops. Small fruits and especially those of a viney nature are easily thrown out of balance by improper fertlizing.

The possibilities of the small fruit are limitless. No one element has any more to do with the success of this venture than does a thoroughly congenial soil. The elements that go to make a given soil thoroughly adapted to the best use of the fruit area are manifold. In this connection we can eliminate all but those forces that directly affect the congeniality of a soil for the fruit crop and those food elements that must be included. Considerable experience in this line under greatly varied conditions leads me to emphasize the local phase of this subject. We can get many suggestions by studying other successful fruit plant feeders but after all in the final we must work everything over and suit our own peculiar conditions. Even on the small farm a variety of soils makes experimental work in several places vitally essential if we would get the best out of the small fruit area.

That system of soil building is only most profitable when it is so conducted as to give us the greatest amount of net value from a given area. We are just waking up to the possibilities in this line, and only by the occasional masterful results secured by some close student of his own conditions can we get an adequate idea of the limitations of this subject.

In a general way we must have a soil provided with enough humus or vegetable matter to make its mechanical condition perfect but not overdone. The last state is often worse than the first. Closely connected with this vital supply of vegetable elements is a sufficient amount of nitrogen to run the fruit plants to their highest degree of fruiting excellence. To do this requires close observation in all lines to guard against an overgrowth of vines at the expense of fruit buds. Too much nitrogen is likely to throw the fruit plant out of balance and so produce an excessive amount of spindling foliage with a corresponding decrease of fruiting impetus, usually made evident by imperfect crowns, poorly developed fruit stems, and often few and unsatisfactory blossoms.

On most farms where a short rotation is employed with clover as a leader, and considerable humus and nitrogen furnished by the product of the stable, sufficient nitrogen and vegetable matter can be supplied on the farm for the best results.

Thus we have supplied at nominal expense the most expensive element needed in fruit-growing. The other vital elements may still be lacking in sufficient amount to give the fruits enough mineral matter and thoroughly balance and supplement the elements mentioned. In the fruit field we must consider clover and vegetable manure as one-sided elements of fertility likely to furnish too much vine-producing food with comparatively little phosphoric acid and potash. In the case of the soil not having liberal quantities of the latter mentioned elements naturally supplied a liberal dressing of stable manure may be worse than no fertilizing at all. In order to determine the amount of available phosphoric acid in the soil, it is well to experiment in a small way with these feeds to prove the soils. Over a greater part of the clays of the North Central States phosphoric acid can be profitably applied in greater or less quantities depending on the personal equation of the soil in hand. Occasionally heavy applications of this element bring returns greatly out of proportion to its cost. On the lighter sand and gravels often potash will be needed to bring out the full benefit of the other elements present and keep the plants in balance.

To use these elements separately and in combinaton in experimental ways on small plats with ample space left for checks where no minerals are used, every fruitgrower can soon determine for himself, just the limitations of these elements on the different kinds of soil on his farm. A few experiments that this scheme naturally suggests can be developed and carried out by each fruitgrower for a series of years to the marked benefit of the operator. A ready mixed fertilizer, unless it has a formula especially compounded to reach one's local conditions must be regarded as unsuited for this kind of work. A little acid phosphate and potash in some form quite free from the other elements, used in connection with stable manure in varying proportions will give us definite results either for or against increased expenditures in this line.

Another element that vitally affects soil building and crop feeding is the character of the season. With the delicate structure of small fruits it is quite easy to overfertilize in wet seasons and consequently under-feed in dry seasons, hence in any system of experimental fertilizing the character of the season must be taken into consideration. Under intensive methods experience often demonstrates the desirability of making two or more applications of concentrates in a growing season, thus fitting more closely the formula used to the season as well as the soil and crop requirements. Again in a cold, backward spring a very light application of a thoroughly soluble fertilizer may help the starting vines forward to an unexpected degree, by simply furnishing a bit of available fertility at a period when, owing to unfavorable climatic conditions, the plants make very slow progress for the want of available plant food at a critical time when little natural food is in condition to be extracted from the soil.

In experimental fertilizing and especially with the small fruit plant, results obtained are often apparently contradictory and must be noted by the operator with all of the local conditions both past and present thoroughly in mind. Hence, the danger of the average fruit man in becoming side-tracked on some simple condition quite overlooked and so plunge into a course of procedure entailing loss for many years in consequence. —By C. B. Cook, before Wisconsin Horticultural Society.

A little time put in a flower and vegetable garden will likely yield much satisfaction.

DEMONSTRATION TRAIN.

The sixth demonstration train trip which recently ended in Santa Clara Valley was the last of the trips which have been planned by the Southern Pacific Company. To give proper estimate of the worth of these trips to this state is impossible, for it will be years before it will all be fully realized, but sure it is, that great good will result. Equally sure is it that the Southern Pacific Company is worthy of great praise for supplying this service to the producers of the state. It must have cost a great sum of money, but the one feature which is most admirable is that the big corporation appreciated the opportunity to aid the producing interests and promptly and completely met the requirements of the situation. If it is possible for the service to be continued, we believe the railroad people will secure returns to justify it. It cannot be gainsaid that they were looking after their own interests in giving this service, although at the same time they were inspired by a desire to benefit the state. We think we all have a strain of selfishness which impels us to ask, "What is there in it?" We enter into a movement to improve the moral condition of our community, we tax ourselves for schools, we build churches, we organize farmers' clubs, or societies, because these forces all make our surroundings more attractive—benefit us directly. Our effort is none the less creditable.

The Southern Pacific, and all railroads, will ship greater tonnage because of more intelligent farming. If to make the farmer more intelligent pays the big corporations, it will pay the farmer to become more intelligent.

Again, if the railroads will run another kind of demonstration train, we believe it too will prove even more profitable. Let such crops as are today produced at a loss or at least no profit to the farmer be carried to the consumer at a price which will change the loss to a profit. Then watch the tonnage increase. At one time the apple growers of Pajaro Valley wished to transport surplus cull or low grade apples from orchards to a point 20 miles distant where drying facilities were to be had. The best rate which the producer could secure was $1.50 per ton. Sugar beets were carried the same distance for 50 cents per ton. The experiment proved a failure and was abandoned because the apple grower could not dry apples under such a handicap.

The benefits from the Demonstration train are mutual. Other dealings between producer and carrier should be equally so. When that is fully appreciated prosperity of both will be enhanced.

SUSTAINS COMMISSIONER.

There has been offered to the fruit growers of the state for several years a cure for all insects and plant diseases, for which great claims have been made. The sale of this material, known as Wheeler's I-X-L Compound, has been pushed in many parts of the state, and especially at fruit growers' conventions have its merits been proclaimed. Recently the campaign has been somewhat stronger in the Pajaro Valley and the support of the horticultural commission of Santa Clara County has been desired. Mr. C. H. Rodgers who is at the head of the commission made what seemed to him a sufficient trial to show to him that the material was of no value. Consequently he refused to lend his support to the campaign. This brought upon him the charge that he was not unselfish and disinterested in his work. Promptly the Pajaro Orchardists Association called a meeting and a committee was appointed to investigate as to the real merits of the I-X-L Compound. A chemical analysis was made and the committee reported: "We have submitted an official sample to a competent chemist whose report shows that this compound is a weak lime-salt-sulphur solution and contains about one-third the available sulphur present in the ordinary lime-sulphur solution." It also adds: "We find I-X-L Compound at the price charged (about $45 a bbl.) as compared with the lime-sulphur solution manufactured at Watsonville selling at $9 a bbl." Strong resolutions were unanimously adopted by the association; supporting the findings of Mr. Rogers and the committee.

Mr. Rodgers is too well known among the fruit growers of this state to need defense but, if he did, it would be a matter of satisfaction to see the vigorous manner in which his own neighbors, and especially the Orchardists' Association have placed themselves squarely behind him. We trust that he, together with Entomologist Volck and Chemist Luther who have all been hard workers in securing remedies for orchard pests, will be encouraged to continue work for more effective remedies and to frankly make known those which are not effective and yet are offered at long prices to our fruit growers. The committee which reported the chemist's findings and made the strong recommendations consisted of Messrs. A. N. Judd, G. A. Morehead, S. A. Earle and G. W. Bird.

EXAMINING BOARD.

Governor Gillett has just appointed the examining board which will have charge of the examination of candidates for horticultural commissioner for the various counties of the state. This is the first board appointed under the recently enacted law which was passed under strong pressure from many of the horticultural sections of the state. The former law which made it obligatory on the part of the county board of supervisors to appoint three horticultural commissioners made the expense too heavy for some of the smaller counties. The new law calls for only one commissioner and, if the board of supervisors so order, two deputies may be appointed. This commissioner is to be examined by the board recently appointed and his fitness for the office proven. This board, we believe, is not yet organized, but is made up of Hon. H. P. Stabler of Yuba City, Sutter county, Mr. A. T. Garey of Los Angeles, and Mr. C. O. Bocks of Cupertino, Santa Clara county.

POSSIBILITIES OF PLANT IMPROVEMENT.

(Continued from Page 635.)

CALIFORNIA CROP STATISTICS 1907.

CROP	ACREAGE	AVERAGE YIELD	TOTAL FARM VAL.	AV. VAL. PER ACRE
Wheat	1,368,000	14.0	$20,520,000	14.70
Barley	1,040,000	28.9	23,444,000	22.54
Oats	136,000	33.5	3,235,000	23.79
Rye	65,000	19.0	1,063,000	16.16
Corn	54,000	34.0	1,561,000	28.91
Other Grains	.....	.....	800,000	.....
Potatoes, Irish	48,000	1145.0	6,264,000	130.50
Potatoes, Sweet	.....	.....	210,000	.....
Beans	.....	(@ 82 lbs)	2,917,000	.....
Onions	.....	.....	750,000	.....
Alfalfa	.....	tons	6,703,000	.....
Other forage crops	.....	tons	658,000	.....
Total Value			$68,101,000	

And this does not by any means include the entire list of crops.

It is safe to say that the twelve leading field and forage crops of California annually produce $75,000,000 worth of plant products, which by means of livestock and manufacturing processes are doubled in value and if we admit the possibility of a ten per cent increase by the adoption of methods above described, the figures speak volumes. Surely such an increase is reasonable, for experience has demonstrated it in repeated instances.

* * *

Work Accomplished.

The work has developed a barley of the six row type about ten days earlier than the common sort and of superior brewing value.

Three varieties of oats have been found of markedly higher yielding promises than the common red oat, and one of remarkable drought resisting quality on account of its rapidity of growth and earliness. These oats grow alongside of the common oats gave double the yield in 1907 and substantial increase the previous season.

Two varieties of wheat which offer exceeding promise of being more favorable to our interior valley conditions than the common sorts in that they are very heavy producers, mature within a short growing period and are of higher quality for milling.

The demonstration of the advantage of drill seeding grain in the Sacramento Valley is of great moment. On twelve varieties of wheat and four varieties of barley, seeded side by side, drilled and broadcasted, but with all other conditions the same, gave an increased return of two to four bushels of wheat per acre and four to six bushels of barley per acre in favor of drilling. The general adoption of this practice by farmers would produce an added income in grain culture of from $3 to $5 per acre and the added cost is not over fifty cents per acre. Is it worth while?

* * *

An increase of a single bushel per acre to the wheat crop means an added wealth of $1,500,000 and to the barley crop another $1,000,000 and unless I am greatly mistaken we have upon our stations now grains which will accomplish this result as soon as they can be widely distributed, and this is at a total cost of about $15,000.

Yet this is possible of greater improvement and wider adaptation.

The average yield of the Lima bean plant is not over 200 grams, but in some preliminary work during the past season individual plants were found yielding as high as 800 grams or four times the average. There is a wonderful field for the development of greater financial returns in this direction. The adaptation of corn, the improvement in quality of island grown potatoes, the adaptation of green manure crops and numerous other lines offer abundant fields of operation. The possible results are fraught with as much of benefit to the people as the development of our irrigation resources in which we are all so interested and are worthy of a serious consideration. They affect too an unusually large number of people and the resulting benefits are far reaching. The possibility of increasing the field crop product of California by a million dollars per year is certainly a subject worth the while of her people.

Agricultural Notes of the Pacific Coast

Northern California

The Santa Rosa cannery began operations last week.

Strawberry season has ended at Red Bluff, Tehama county.

Sonoma county will make a liberal exhibit at the coming state fair.

Geyserville entertained the Sonoma County Pomona Grange last week.

Red Bluff, Tehama county, reports sugar beets doing exceptionally well.

Several boxes of Sacramento cherries have sold in Chicago as high as $2.60.

California National Forest has private phone communication with Elk Creek.

There were several light frosts at Healdsburg, Sonoma county, last week.

A few boxes of apricots are being occasionally shipped in cars with cherries.

Royal Anne cherries will be larger and better crop than most of the other varieties.

Improvements are being made and the capacity increased at the Healdsburg winery.

Several shipments were made of wool from Healdsburg, Sonoma county, at 25 cents.

The California Fruit Distributers reports the sale of one car of cherries in New York for $4,700.

Georgetown, El Dorado county, reports cherries rather light in crop, but exceptionally large and of fine quality.

Canneries at Haywards are beginning the season's campaign on fresh fruit, cherries being the first to be canned.

A boy of eighteen years has won honors at Red Bluff as strawberry picker, having picked 182 baskets in one day.

The Humboldt County Cow Testing Association finds its plans working out very satisfactorily and the members all enthusiastic.

It is estimated that over 3000 people attended the picnic at Davis, Yolo county, at the time of the dedication of the new dormitory.

Alameda county is considering the advisability of a fine roadway to be constructed through Niles Canyon from Niles to Pleasanton.

The Morse Seed Co. of San Francisco is looking through Sonoma county for a thousand acres, which will be desirable land for a seed farm.

Fruit growers at San Leandro have started a movement to establish a producers' cannery. It is hoped to have the plant in operation inside of six weeks.

The validity of the election recently held for an irrigation district near Stockton, which showed an overwhelming vote in favor of the district, has been upheld.

The lack of light spring rains has been seriously felt by the Humboldt county dairymen, and it is now feared that the crop this season will be the smallest for years.

Sonoma county egg producers have been puzzled because of the lowering price of eggs. It is thought to be brought about by dealers who are not friendly to the producers.

Central California

Late sown Tulare county beets are being irrigated.

Tulare county produces about 275,000 pounds of honey each year.

Barley near Corcoran is reported to run about 30 sacks to the acre.

A Hanford strawberry grower reports a $2000 net profit from six acres.

A close estimate shows that there are about 14,000 Japanese farmers in California.

Hay and dry grass fires are reported from many sections of the San Joaquin Valley.

A big grass fire in western Tulare county burned over 1200 acres before being controlled.

Promoters are looking over the section around Fresno with a view to selecting a site for a sugar factory.

Tulare county claims the largest sugar beet field in the world. There are three sctions of land in the one field.

El Camino Real from San Diego to San Francisco has most of its length marked by the mission bell sign posts.

"Save your hay for the higher prices," seems to be the sentiment of the growers of the San Joaquin Valley.

Porterville reports a disastrous grass fire which started from phosphorus put out to poison gophers and squirrels.

Corn fields near Hanford are being troubled with a pest of green worms which perforate the leaves and do great damage.

The copy of the contract which the Farmers' Union will make with its individual members is being forwarded for inspection.

The Terra Bella, Tulare county, citrus outlook is good. Much new acreage is being set and many settlers are filling the country.

The Kings County Raisin and Fruit Company will install some of the best machinery for handling raisins yet put in any plant.

Tulare homing pigeon fanciers recently conducted a race from Tehama, Tehama county, the winning bird averaging 1145½ yards per minute.

The result of the first year in the big asparagus fields at Corcoran has been very gratifying, and a big cannery is contemplated before next season's cut of "grass."

The general sentiment among people who saw the good work done by the demonstration train has been that the service would be of great benefit to the state if continued.

A project is on foot by which the big Miller and Lux Canal in the western part of Fresno county between Firebaugh and Bethany, will be extended to cover much new land.

A fine cannery was destroyed at Fresno recently by fire. It will prove a total loss. It had just started on the season's run and hundreds of people will be thrown out for the whole season's work.

A Cultivator representative in the orange section in Tulare county says that estimates show over 25,000 acres of citrus trees will be planted this season in Porterville, Lindsay, Exeter and other nearby sections.

Southern California

Orange county beet output will be immense.

Ventura county beet crop is looking exceptionally well.

El Centro is planning for a mill to manufacture alfalfa meal.

The planting of citrus trees near Santa Paula is greater this spring than ever before.

The hold over crop of lima beans in Ventura county was estimated on May 1st to be 200,000 bags.

One San Jacinto grain grower is harvesting 18,000 sacks from 1,000 acres of summer fallowed land.

One wool grower in Ventura county makes the largest sale of the season in disposing of 700 bales to a Boston buyer.

Cherry Valley in San Bernardino county was given nearly an inch of rain last week. It was beneficial to late sown grains.

Shipments of farm products from Imperial Valley have been so heavy that the Southern Pacific has been unable to meet the demand for cars.

Cold weather has delayed the bean crop somewhat and some damage was done by army worms. This has given poor stands in some parts of Ventura county.

The Mutual Dairy Association composed of 400 Southern California dairymen expects to supply 50,000 pounds of milk every day to the city of Los Angeles.

After San Jacinto had supposed its claim to the big sugar factory had been definitely settled, it now appears that the company will build its new factory at Perris.

Mustard seed growers near Lompoc, Santa Barbara county, are entering an emphatic protest against the placing of mustard on the free list in the proposed tariff revision.

The Tustin, Orange county, Packing Co., has tried the experiment this year of shipping loquats to eastern markets. It is not yet determined that the experiment will prove a success.

The crop of oranges in all Southern California is much in excess of earlier estimates and some of the fruit has shown more frost injury than anticipated. All oranges except Valencias will be forwarded within the next two weeks.

The Farmers' Club of Mound, Ventura county, is a good live organization. It holds monthly meetings addressed by men who have information to give to farmers. This month the principal address was delivered by Dr. Elmer Hall of Berkeley.

The Orange County Celery Association recently made final returns on last season's shipments. Total for the year's business for the association was $449,841, or an average of about 25 cents per dozen on all shipments. Total output of the association was 1422 cars.

The Fullerton Tribune quotes from an eastern magazine and says that a new walnut picking machine has been invented which will gather the nuts from a thousand acres of orchard per season. It is claimed that it will do the work of one hundred men, and the cost of operation is only $3.00 per day.

The Coast

A Walla Walla, Wash., farmer has rye six feet in height.

The state of Washington has an official legally appointed mole catcher.

Yuma people are asking for a territorial road to be built connecting Yuma with Phoenix.

A Wenatchee, Wash., apple grower has contracted for next fall's output of apples at $2.50 per box.

The measurement of the Colorado river at Yuma, Ariz., shows it to stand at 26 feet on the gauge.

Seven local unions of the Farmers' Union recently organized a district union at La Grande, Oregon.

The first half crate of strawberries shipped from White Salmon, Washington netted the grower $10.

A farmer claims that he is having good results with growing spineless cactus on the mesa near Yuma.

Flour mills at Seattle have all discontinued grinding of flour until the new crop has reached the market.

The Camas prairie orchards near Grangeville, Idaho, withstood the early May frosts and have an immense crop.

It is reported that immense stocks of canned fruits are held over from last year in the Portland, Ore., markets.

Recent rains were of great value to hop growers of Oregon, and the feeling prevails that a fair crop will be secured.

The poultry department of the coming Interstate Fair at Spokane, Wash., promises to show a greater display than ever.

A drenching rain was given to the Inland Empire and northern Idaho, which insures immense crops of hay and grain.

A manufacturer of Walla Walla, Wash., will exhibit a big threshing machine at the A-Y-P Exposition, finished entirely in polished curly fir.

The Oregon State Grange recorded the highest attendance at its last annual meeting held at McMinnville, when 500 members were registered.

During the twelve months ending December, 1908, Hawaii exported to United States mainland $35,570,636 of raw sugar and $1,940,678 refined sugar.

Owing to the high price of grain and prospects of a big yield, many farmers near Pullman, Wash, will discontinue stock raising and raise wheat.

There will be a special cup offered at the Interstate Fair in Spokane in September for the best herd of swine exhibited. The cup is of such value that strong competition is expected.

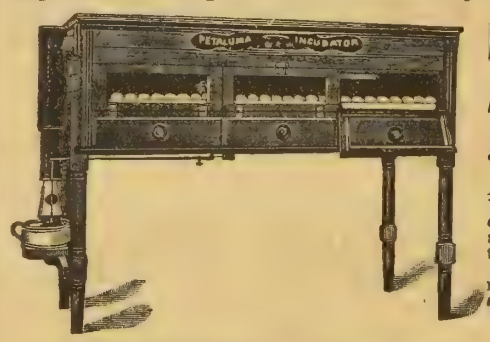
There will be exhibited at theA-Y-P Exposition a log which is not only too large, but too long for any sawmill in the world. In order to saw a board from it for exhibition purposes, a special saw operated by hand was made seventeen feet between handles.

The Agricultural expansion taking place in Arizona is shown in figures recently given by the Arizona Republican showing land cultivated in 1905 in that valley to be 96,863 acres. In 1906, 104,015; 1907, 112,568; 1908, 126,717. And this has been done with the increased abundance of water.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. You ***can't*** afford to try and be successful and not get results. ***Midland Poultry Food*** will produce results. Try it and see. $1.95 per sack



Petaluma Incubators and Brooders

278 Bandini Ave. Home Phone 1490 RIVERSIDE, CAL.

The Palouse county near Pullman, Washington, was given a fall of six inches of wet snow near the middle of May.

Cutworms which threatened such great damage have proved most perplexing, but have not been such a serious pest as anticipated.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

A QUESTION OF LOCATION.

WE need a warmer climate for health's sake, and wish to engage in chicken raising to some extent.

The various Boards of Trade have favored us with Literature, which is "Puffy" and says nothing about fogs and fleas, which are rather live questions, and we wish for more definite information from a resident who is also, if report speaks truly, an enthusiastic lover of fine chickens herself.

Am getting excellent results from my birds here. The past month they have averaged 22 eggs per pullet, 21 each for March.—G. P., Nelson, B. C.

A personal answer was sent to the above. This question is one that many are asking about our country and the responsibility of advising people to come here is one that is rather heavy. Of one thing I feel assured, and that is, that there is no locality so favored for the raising of chickens for eggs and market, but there is no place the scene of more failures than right about here. And the reason is so very plain, that all who run may read. Inexperienced and invalid people flock here, intent upon gaining health, and are told fabulous tales of successful poultry raising, and think that all they have to do is to buy an acre of ground and a dozen hens, and sit down and let nature to the rest.

They soon find that Nature, which has so beneficiently endowed this climate, has also made ideal conditions for pests as well as chickens, or as Bro. Royce wrote me, when I asked his advice from Ohio," Bless you, Mrs. Metcalf, fleas and snakes and bugs of all kinds enjoy this climate just as well as humans do."

I will say this, so far as snakes are concerned, there are not as many here as I used to see in Ohio during the warm months, flies and ants and mites are not one whit worse here than they were there, for when the warm days of spring come there earth swarms with awakened life of all kinds, and they grow with a vigor there, that they do not seem to attain here, excepting by neglect. Land here is high in price, and getting higher every year, so an investment in an acre or two here, is as safe and sure as any investment can be, and the climate goes with every acre, with its health-giving benefits, to which hundreds and thousands owe their length of days and enjoyment of health. Those who bought five years ago paid less than those who buy today. Just as surely, those who buy now, will pay less than those who will come later. The troublesome flea is not troublesome except near the coast, and there but a few notice them. They seem to have an "affinity" for tenderfeet, and do not seem to bother those who have become acclimated.

About a cash market for eggs and poultry, it depends very much upon the producer himself. The hotels and best caterers demand the best of milk fattened broilers, for which they pay generously, but usually the large broiler plants contract them by the year, so they have no use for a dozen or so from a small breeder. A broiler plant is under construction at Inglewood, which is under contract to furnish 200 pounds of broilers daily, of milk fed, crate fattened first-class stock, at first class prices, but it takes large capital to conduct a plant of this kind, and, naturally they take the cream of the trade.

A glance through one of these establishments, with improved methods of feeding, incubating and killing, reduced to a science, will convince the small breeder that he cannot hope to compete with these gigantic enterprises, yet they stand in the same relation to the producers of commercial poultry, that the large fancy plants do to the small breeder of fine fowls, and there are those private people to cater to, and these are the ones to whom the small breeder must look for a market. The new Southern California Breeders Association is the medium through which one can find that market the least expensively, and was the outcome of just such a need. There are other similar associations near San Francisco. By uniting forces, the various commissions are eliminated, and the product reaches the consumer without passing through so many hands, in fresher condition, and with the minimum of expense.

The man who is looking for a location here must be alive to his needs. He must understand the character of the soil, and carry in mind the fact that poultry cannot thrive upon either 'dobe' or alkali land. Sandy soil is best, and if those conditions are not available, he must remove at least six inches of the top soil from the ground where his chickens run, and replace it with sand, which must be renewed yearly. One had better pay more for sandy soil in the beginning, and there are many places surrounding Los Angeles where the best of sandy soil may be obtained.—Mrs. Metcalf.

TURKEY CULTURE.

CORRECT breeding is an art and needs as much study and experience as any science. The feeding, housing, and caring for stock, is very important, but the mating of our domestic fowls and animals needs far more forethought and care. The farmer today is giving great study, both practical and scientific to farming, regarding the soil, but his best thought and intelligence is required in breeding his stock so as to improve it. Every year his aim must be to produce something better, to improve along the line, which gives stock a better market value such as a carcass that will bring more in the market, an improvement in producing quality and quanitity of eggs, or the production of stock that will approach nearest the standard of perfection. In the turkey in a state of nature the survival of the fittest is all that can be looked to, to continue, which only means vigor of the breed, but in domestication there are other characteristics that are necessary to make them profitable. When a turkey of desired qualities is found, by careful selection and correct mating for a number of years, these characteristics become hereditary. Only in this way is it possible to improve stock and maintain improvement. It is said that if turkeys are turned out to mate as

they please, the breed soon deteriorates. In breeding turkeys for the market the profits depend upon the number of pounds produced, but in breeding them to the standard of perfection, profits depend upon the excellence of each individual from the breeder's standpoint or their ability to successfully compete in strong competition, or exhibit the superiority of their ancestors and their reliability in reproducing their own type. When a bird is to be established many things are to be taken into consideration. It is most desirable to have them bred to one type. The law of "Like begets like" works in proportion to the purity of the breeding of each parent. Proof of this statement coming under our own observation: One year we purchased a very handsome young Bronze tom, whose ancestors had the reputation of being pure bred and to all appearance he was pure bred, but in moulting at sixteen months old he moulted out white wings, not only this but several of his offspring had this same disqualification also; showing a cropping out of the impurity of his parents or ancestors on one side or the other. All offspring from this tom were fit for the market only.

Early maturity is not always desirable in breeding stock, as early maturity naturally does not go with longevity or size. There is no doubt that quick growth is desirable from the market standpoint but slower growth has a tendency to prolong the usefulness of a bird wanted for a breeder. Some diseases are hereditary and will crop out in future generations. So it is very necessary that if we are to have healthy stock, we should be sure that we are selecting healthy parents whose ancestors were known to be free from diseases.

Much of the roup that is so prevalent in the fall among turkeys, might be traced back to some roupy parent. All birds that have shown a tendency for contracting this dreaded disease should be excluded from our breeding pens.

SCALY LEG.

Scaly leg among chickens is caused by a small parasitic insect which works on the legs of the chickens causing secretions which form the scales. The work of this minute insect is not only annoying to the fowls but saps their vitality. Often the scales are knocked loose, causing the legs to bleed. The parasite spreads more rapidly when fowls are confined.

As winter comes on and chickens are put into their houses for roosting, examine them for scaly leg, for if it is in the flock it will spread rapidly in the hen house. The best time to examine and treat them is at night. First wash the diseased leg with warm soapy water to loosen the scales, then apply carbolated vaseline. It is best to treat every fowl to make a sure job. Two treatments about a week apart usually kills all the insects and cures the legs. Three good treatments never fail to do the work. It is also necessary at the same time to disinfect the hen house in order to kill insects harboring in the walls and on the roof.—N. W. Horticulturist.

FEEDING MEAT TO FOWLS.

Too much meat, either ground or fresh, is injurious as it causes bowel disease. It may be fed three times a week if dried, ground meat is used and twice a week if fresh butcher's meat is given. One pound of fresh meat, chopped, is about the proper quantity for fifteen hens, and half a pound of the ground meat answers for a meal, mixed with other food for the same number. If preferred, the ground meat may be given twice a week and the fresh once.

The subject of breeding is an almost inexhaustible one, and takes a vast amount of study and experience to understand it. Many have made it a life study and then been at a loss to understand many phases of the subject. Yet if some of the first and a few of the simplest principles were observed in mating and breeding improvement would surely follow each year.—Poultry Tribune.

Coulson's POULTRY FOODS

Growing Chick ...Food...

Can be fed damp as a mash or dry in hoppers. Feed it to your chicks up to 3 months old. Gives rapid growth and health.

It will save your grain bill, and you cannot afford to be without it.

Coulson's POULTRY FOODS

Special Dry Chick Food

Makes Them Grow

Throw it out in the Litter and Make them Work

COULSON'S SPECIAL DRY CHICK FOOD, during the five years it has been on the market has justly earned for itself its great reputation as a life-saver for little chicks by its special adaptation to their needs.

THE UTMOST CARE is observed in the selection of each of the dozen or more articles composing this unequaled feed; tender seeds, cracked grains blown free from dust, steel-cut oats, tiny pieces of dried meat and bone, willow and pure bone charcoal, are combined with other very necessary ingredients; every article being selected with special reference to its quality, strength and desirability for the needs of the young chick.

FOR YOU TO BUY the many different articles composing Coulson's Special Dry Chick Food is quite impracticable; you could not be certain as to their quality for one thing, and the high cost of certain of them when purchased in small lots might lead to their being left out to the detriment of the chick.

TO MAINTAIN the present high reputation of COULSON'S SPECIAL DRY CHICK FOOD, nothing is left undone to make it absolutely the best feed that can be made for the little chicks.

COULSON'S SPECIAL DRY CHICK FOOD can be fed exclusively to your little chicks for the first six weeks, at a cost of about four cents (4c) each; and what is of still greater importance, it will do all that can be done in the way of feed, to bring them through that critical period of their lives in full health and vigor.

TO RAISE EVERY CHICK you hatch; to have fine, large, healthy chicks; to have chicks that will stand up and crow when eight weeks old; to raise chicks that you will be proud of, FEED COULSON'S SPECIAL DRY CHICK FOOD, THE LIFE-SAVER. Write us for free samples and prices.

CONGO ROOFING

NEVER LEAK

A SURETY BOND WITH EVERY ROLL

WE don't ask you to take our word for the durability of Congo. We give you a genuine **Surety Bond** issued by the National Surety Company, giving you absolute protection and the certainty of satisfaction.

This Surety Bond is wrapped with every roll of Congo. On our three-ply grade it guarantees the roofing for **10 years.** There is no catch about it. The bond means that we have satisfied the National Surety Company that we will stand by the provisions of the guarantee; and if we should fail to do so, the loss will fall on them.

This SURETY Bond is as good as a Government Bond.

WITH Congo on your roof, and the bond in your safe, you are absolutely protected.

If Congo was made of paper it would still be the best roofing to buy with such a guarantee, for the guarantee means that we will keep you satisfactorily roofed for ten years, and that is what you want.

But of course Congo is not made of paper, but of such **durable, waterproof** materials that there will be no trouble or complaint during the 10 years. If it were not the Surety Company would not guarantee it.

FREE SAMPLE

LET us send you a sample of Congo, together with a copy of the Guarantee Bond. Both free on request.

Bees and Their Care

By Henry E. Horn, Riverside

PEDDLING HONEY.

FOR some years I sold my honey by wholesale, and might have never seriously contemplated a better plan had not a poor honey year nearly forced me to peddle much of my crop. Just how I did it might not be the best plan, but some of my ideas may be worth telling.

Most of my sales were made from a spring wagon on the cover of which my advertisement was plainly lettered. The wagon-cover was white, and on either side of the wagon was the word "Honey," large enough to be read across the street, while my name and address were of smaller lettering, all made of dark paint. On the back part of the wagon-cover the word "Honey" was lettered so it could be read over a block away. Most of my town sales were made in Modesto, a town of perhaps 3500 people. I began at the east side of town, and made a house-to-house canvass, up one street and down the next, shuttle fashion, till the west side was reached. When peddling on Fourteenth street, all houses facing between Fourteenth and Thirteenth were visited, and so on. The bulk of my sales were made at the homes. Frequently a lady would take the honey and request me to call on her husband at the shop or store for the pay, and it would take only a few minutes in the evening to make collections for the day. Often a lady would not want the honey at the time, but would want it, say, two or three weeks later, and I made it a point to supply the honey on time. If a person really wanted the honey, and did not have the money on hand at the time, I would reply something like this: "You know your business better than I do. If you want the honey, take it and leave the money at Maze's drug-store when you get it. Maze is a square fellow, and I shall get the money all right."

Many, both in country and town, would take the honey on those terms, and the loss by bad accounts was very small. Mr. Maze really liked to do free collecting for me, as it brought prospective customers to his store.

One of the leading grocers said it increased his honey sales when the town and surrounding country became interested in honey by my efforts. When a prospective customer on my beat had already inferior honey, adulterated or otherwise, it was a part of my business to trade for it, for very few will buy honey when they have any kind of honey on hand. Occasionally a person would think my honey was adulterated, and it sometimes took a quarter of an hour to convince such a doubter, but it had to be done before I left.

Granulation of our honey is one of the most troublesome things in the peddler's way. The best solution I have tried is a boiler, over seven feet long and nearly two feet wide by 20 inches deep, inside measure. The sides and ends are made of 1½-inch redwood boards well bolted together. The heavy galvanized-iron bottom extends 4 inches past the body of the tank at each end (to the end of the side-boards), up a little at each side and up a foot in front as insurance against fire that may flash up from the furnace. The sheet-iron bottom was fastened to the wood by screws through white lead. The lid (which should not be turned down when melting honey) is of matched Oregon pine fastened on with strap hinges. The brick furnace is deep enough to make room for weeds, brush, or vines for fuel; and I regret that I used six-inch pipe instead of eight-inch; for when using weeds it sometimes smokes the room. A slatted bottom keeps the iron from sagging. By using two slatted trays, one longer than the other, and held in place by brick, I can melt honey in five-gallon cans, and in one and two quart jars at the same time. Honey in Mason jars must be melted well, while in the cans it is not necessary to melt it for sale. This boiler is also fine for melting combs for the wax-press.

Owing to change of farming plans it is not likely I shall peddle much more—only fill local orders. But it is delightful to hear the boys say to their mothers, "Here comes the honey-man!" It is also interesting to hear the ladies say, "I am so glad to see you come."

When we consider what a palatable and wholesome food is honey, and how little expense and labor is involved in securing and caring for a few colonies of bees, it seems passing strange that so few farmers take up bee keeping. The bees work for nothing and board themselves; and, besides storing a large quantity of surplus honey for the family and for sale, do a valuable work for the farmer by pollenizing his clover and fruit bloom. In one neighborhood, where bees are kept, farmers sold up to $75 worth of alsike clover seed per acre last year, largely owing to the work of the bees, and one bee keeper in the same section sold $3,000 worth of honey.—Advocate.

If you "keep a bee" you should also have more strawberry plants. It is said that a swarm of bees will visit 10,000 strawberry plants in one day.

Half a dozen colonies of bees in well arranged hives are sufficient to begin the bee business. In fact, they are about what the average farmer should keep. Before embarking in the business, however, it is advisable to become posted as much as possible. This can be done by studying books and papers on bee culture and by visiting some apiary conducted by a man who knows the business.

With a cage to set over a hive one can work in comparative comfort all day long, and seldom get stung. Bees are very sensitive creatures, and they do not like robbers about their homes. If we open one of the hives, and a hungry lot of robbers commence to steal from them, how mad they will get! And we are almost sure to get stung.

Keep honey in a warm and dry place with a current of air passing through it. In the majority of homes, possibly no better place can be found than the attic.

If you have a good market and retail your honey direct to the consumer you can possibly realize more profit by putting it up in one and two pound glass jars.

Never take honey from the hives for extracting until nearly all sealed. The longer it is left in the hives the better the quality.

The Schmeiser Portable Automatic Derrick

Comes nearer stacking hay without assistance than any other Derrick in the market.

Write for descriptive circular today and we will tell you how it can be done.

Davis, California

General Agriculture

PEAT AS FUEL.

PEAT is partly decomposed vegetable matter formed either where ground is saturated with water most of the time or where it is permanently covered with water, It is the dark-colored or nearly black soil found in bogs and swamps, commonly known as muck, although technically a distinction is made between peat and muck, the latter name being restricted to those forms of swamp deposits that contain too much mineral matter to burn freely. Dry peat may be very fibrous and light colored or compact and structureless and dark brown or black. It is usually somewhat lighter in color when dry than when freshly dug. When wet it contains as a rule from 80 to 90 per cent. or more of water; that is, a short ton of wet peat rarely contains more than 300 pounds of dry peat and may yield as little as 100 pounds. In the wet condition it is entirely noncombustible, and the various processes by which it is prepared for use or market consist principally of methods for ridding it of water quickly and cheaply and for increasing its fuel efficiency and transportability.

The great peat deposits that are widely scattered in the northern part of the United States have at various times aroused strong public interest. In the winter of 1902-3, for instance, when the strike of the coal miners in the anthracite region of Pennsylvania brought the country to realize that it was to a large extent dependent on these miners and their employers for an important part of its fuel supply, a number of writers familiar with the conditions in the countries of northern Europe called attention to the fact that those countries, possessing a climate much more severe than ours, were using great quantities of peat for fuel, while in this country, although the material was abundant, it had only exceptionally been prepared for use and then in the crudest way. During the next few months many experimental and speculative plants were established to convert peat into fuel, but unfortunately many of these attempts were financially unsuccessful, and as the strike was soon over and coal could again be had at reasonable prices and very little peat fuel was put on the market at any price, interest in peat waned and at the present time the public is almost indifferent to it. In the few places where it can be purchased, however, it finds a ready sale and is thoroughly satisfactory for all domestic uses.

An interesting account of the nature, origin, and uses of peat appears in a report by E. S. Bastin and C. A. Davis, on the peat deposits of Maine, which has just been published by the United States Geological Survey as Bulletin 376. Copies of this bulletin may be obtained free of charge by applying to the Director of the Survey at Washington, D. C.

WHO OWNS THE TREES?

Freudenstadt is a town of seven thousand people in the Black Forest region of Germany.

Chisholm was a town of six thousand in the Big Woods country of Minnesota.

Every year, from the tall black pine trees which grow in ordered regiments on the six thousand acres of publicly owned land about Freudenstadt a regular crop of lumber is cut which pays all the expenses of the city government—Mayor, Aldermen, Police and Fire Departments. And that crop will go on forever. The thrifty people of Freudenstadt may devote their whole attention to their thriving iron and chemical industries, knowing that the beautiful and beneficient forest will pay all the cost of their municipal activities.

Every year—until this—greedy private corporations have sent their hordes into the country about Chisholm to loot the great pine woods, leaving behind them a trail of ruin and desolation and piling up the dry slashings like kindling wood ready for the match. Every fall the patient people of Chisholm have gone to bed with the acrid smell of burning pine in their nostrils, fearing lest before they woke the forest might take its fiery revenge. Last summer it came. For weeks thick clouds of smoke lay over the town. Then on a Saturday night the hurricane of flame swept down and burned Chisholm to the ground. So sudden and dreadful was the onslaught that domestic animals dropped dead in the streets, overcome by the heat. Men carried out their sick on beds and rushed them through the smoke and flying embers to places of temporary safety. One woman died of fright. In the morning more than five hundred families were homeless.

Freudenstadt is a town without taxes. The forest pays them. Chisholm is a town without homes. The forest destroyed them.

That tells—in little—the story of the forest policy of the United States and its results, as compared with that followed in civilized countries.—From Henry M. Hyde's "Looting the Forests," in Technical World Magazine.

POISONOUS SUBSTANCES FORMED IN THE SOIL BY PLANTS.

The Bureau of Soils of the U. S. Department of Agriculture has recently added a new factor to the causes of soil fertility. The claims of the Bureau are that practically all soils contain a sufficient supply of mineral plant food for crops to grow indefinitely, and that plants give off or excrete from their roots certain toxic substances into the soil. These by accumulating become poisonous to the plants that produce them on the same principle as a man being shut up in a tightly closed room will soon cause the air in that room to become poisonous to him by exhaling poisonous gases into it. Every kind of plant excretes a substance that is poisonous to itself, but this substance may not be detrimental to other crops and may even be beneficial. By growing the same crop, say wheat, upon the same land year after year, the toxic or poisonous substance given off by the roots of the wheat plants accumulate to such an extent that the soil actually becomes poisonous to wheat plants and they refuse to grow there. If now other crops be grown on that land or it be fallowed these toxic substances disappear and wheat can again be grown there. Thus we have the benefits of rotation.

If manures or fertilizers be added to this soil, they have the power of neutralizing the poisonous substances so that wheat can again be grown there. The manures or fertilizers also add new plant food to the soil, but this is a secondary consideration, as the principal reason for adding it is to neutralize the toxic substances excreted by the roots of the previous crop.—Campbell's Farmer.

POISONING SQUIRRELS.

Mr. Oestergard of Burbank while in the office recently stated that he had found one of the best poisons for ground squirrels to be the strychnine and wheat combination. To mix, he dissolves ⅛ ounce strychnine in ½ pint vinegar. This is sufficient for eight pounds wheat. Before being placed on the wheat, sugar is added to the dissolved strychnine mixture until it will take up no more, after which the wheat is stirred into the mass, and it is spread on trays or plates to dry, being shoveled or stirred over several times to insure thorough mixing of the poison.

Regarding the query as to deer that have infested one man's orchard, Mr. Oestergard says that if the strychnine mixture without the sugar—is placed upon leaves which Mr. Deer visits, it will sicken him so that he probably will not come back again. He controls rabbits and other pests that destroy his melon vines by using the same mixture. One or two drops on leaves which rabbits nibble is sufficient.

Of all ready Roofings, Pioneer "Rubber Sanded"—and Pioneer "Rubber Flaxine"—are best.

No other roofings compare with them in wearing qualities.

Before you decide on what roofing to use, it will pay you to investigate "Rubber Sanded" and "Rubber Flaxine."

Scalefoe

Greatest Known Spray or Wash for Scale: San Jose, Black, Red, Purple and Brown. Also a sure thing for Red Spider, Canker Worm, Moss, Caterpillars, Lice, Codling Moth, and all Insects and Bugs that infest plant life; without injury to the plants, and with positive benefit to the soil, when applied. Also kills Lice and Mites on Poultry.

This has long been the leading Spray or Wash in many sections of the country, wherever introduced. We have bought the formula and the rights for this section and are putting it out under our own brand. No article can bear the "West Coast" name unless it is the best of its kind. We guarantee Scalefoe to be just as represented.

Gallon can, 85 cents; 5 gallon can, $3.75. Price f. o. b., Los Angeles, but if not sold by your dealer will send gallon can for $1 or 5 gallon can for $4, freight prepaid by us within 200 miles. Write for price in barrels. Mix 20 parts water to 1 part Scalefoe, before using; makes it the cheapest as well as the best. Satisfaction or money back.

Made by the

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Asparagus.

How long can I gather asparagus? I have a half acre which is two years old, three years from the seed. I gathered for the first time this year. Recently the yield is not so good as usual.—Subscriber, Redlands.

Do not cut any more this season but allow everything but weeds to grow until late in the fall when you can cut the summer's growth and haul it off and burn it. The fact that you are not getting as much as earlier in the season shows that the continual cuting is weakening the plants and it would be possible to destroy them altogether by continued cutting. By another year you can cut more freely. —Q. A. L.

Willow Baskets.

Will some one please give simple instructions for making willow baskets?—B. J. O'M., Anderson.

If any of our subscribers has experience along this line, a communication will be appreciated. It is surely something out of the ordinary.

Ants.

How may we rid a live oak tree of ants?—B. J. O'M., Anderson.

Spraying with kerosene emulsion would make it very unpleasant for the ants. If the hill can be found, the use of bisulphide of carbon will greatly decrease their numbers, or perhaps kill them all. The scattering over the trunk of buhach, which is intensely disagreeable to all insect life, will usually cause them to leave their haunts. This would be expensive in any great quantity, but, in the case of one tree near the door, it might be advisable to scatter over its rough trunk. An ant paste which has been advertised in the Cultivator is said to be exceptionally successful in driving them away.

Lady Birds.

Will you be kind enough to inform me what kind of an insect this is enclosed in the bottle. It is feeding on potato tops.—H. A .S., Carpinteria.

This was referred to Mr. S. A. Pease of San Bernardino. He writes: "Two of the specimens are the larvae, and the other two evidently the pupae, of one of our common lady birds, probably Coccinella Californica, consequently I think your correspondent must have been mistaken about their eating potato plants, as their food is principally aphids or other soft bodied insects."—S. A. Pease.

Garden Bed.

I want to make a permanent garden without plowing or spading any ground. In other words, I wish to haul different kinds of soil, mix, and make a garden bed on the surface of the ground. Do you approve of the method? My plan is to take planks about 18 inches or two feet wide and stand them on edge permanently, using stakes on the sides, making the beds as long and wide as desired. Do garden beds prove entirely satisfactory made of mixed soils and imbedded just on the surface of the ground? I would expect to haul rich sediment from the river and also manure from the livery stable, and then add some other different soils, such as would possibly be easily obtained, according to your best judgment. I would like to plant about ten or fifteen different kinds of garden vegetable and then attend to them in a systematic manner.—Subscriber, Ukiah.

We fail to see the gain in such an expensive way of making a garden. Of course if the soil is an alkali "dobe" or of such a nature that it is impossible to use without such treatment, it would be necessary, but even then, the expense would never permit any profit on the product. If the ordinary soil is in fairly good condition, it can be improved wonderfully by either spading in of fertilizers, especially of vegetable manures in the form of stable manure which will give an almost immediate supply of humus. We can also imagine where a very coarse gravelly soil is encountered, the hauling of richer bottom land would be a great benefit. We see, of course, no objections to making beds along the lines suggested by the subscriber, as it would certainly give a rich soil in which to grow a few vegetables. In regard to adding stable manure, we would suggest, however, that it would be best to spread it some weeks or months before planting unless it be well rotted before it is applied. The application of fresh strawy manure and spading in deep does not make, immediately, a good condition of soil. Such manure, however, makes an excellent mulch to spread over the top of the ground after the seed are planted.

Government Whitewash.

Can you give me the government receipe for whitewash. I have been told that it is a whitewash used on the buildings at the experiment stations that is as good as paint for rough wooden buildings, and that it can be tinted any color.—Mrs. R. T., Escondido.

Below is given the formula for government whitewash used on light houses and other public buildings. You will probably find this nearly as expensive as paint. For cheap buildings of rough lumber we imagine the use of ordinary whitewash to which a little salt water has been added as a fixative will answer satisfactorily with occasional renewals. Here is the so-called government formula:

Unslaked lime, 2 pecks; common salt, 1 peck; rice flour, 3 lbs.; Spanish whiting ½ lb.; glue (clean and white), 1 lb.; water a sufficient quantity. Slake the lime in a vessel of about 10 gallons capacity; cover it, strain, and add the salt previously dissolved in warm water. Boil the rice flour in water; soak the glue in water and dissolve on a water bath, and add both, together with the whiting and five gallons of hot water to the mixture, stirring all well together. Cover to protect from dirt, and let it stand for a few days, when it will be ready for use. It is to be applied hot, and for that reason should be used from a kettle over a portable furnace.

Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Trespassing Cattle.

My neighbor and I built a partnership fence between farms which prevented the cattle and horses from going through. Since then he has rented his place to parties who keep sheep. Am I compelled to fence against these sheep? I use a part of the fence for cattle and horses, and part I do not use at all. What is allowable in taking up sheep where they are on my land causing damage?—Subscriber, Winters.

You are not compelled to fence in order to keep your neighbor's sheep off your property, but you may do so, and if your neighbor makes use of the line fence to help enclose his property by joining on to it, you could collect half of the cost of fencing from him, provided the fence is a lawful fence.

You have a right of action for any damage caused by the sheep through trespassing on your land. You will find in the Cultivator of May 27th, under the head of "Legal Queries" the provisions of the state law governing the taking up of stray animals. The old state law there referred to is superceded by the later enactment, and the only damage now obtainable without an action at law is as follows:

The total amount paid for recording the notice containing the description of the animals, etc., with the county recorder;

The sum of 15 cents per day for the keeping and care of each horse, mule, cow, calf, etc.

The sum of 5 cents per day for the keeping and care of each sheep, goat, or other animal not hereinbefore specified, providing that the taker-up of such animals must properly feed and water the same.—E. L. Payne.

Division of Property.

A man dies in California leaving no will. He is survived by a wife and three children, two of the children being under age. The place—standing in his name—was mortgaged, and there were other debts. The wife put some of her own money, given her by her mother, into the place. Supposing the mother and children stay on the place, rent land, tend the home place, pay off the mortgage and all doctor bills and funeral expenses and other debts, and make improvements, what share will each receive in a division of the property?—R. E. H., Fullerton.

It is impossible to give an intelligible answer to the foregoing in the short space allotted here. There are too many variations possible, but briefly, if the property was the separate property of the deceased, one-third would go to the surviving wife and the remainder in equal shares to the children.

The separate money of the wife having gone into the place, she would be entitled, except for circumstances which might alter the case, to a proportionate amount of the property which would not belong to the estate, and which she would have, plus her one-third interest.

If the property was community property, she would have a one-half interest, plus the interest belonging to her by reason of her separate money having gone into it, and the other half would go equally to his children.

The balance of the question requires a knowledge of more facts than the query furnishes to enable the writer to answer.—E. L. Payne.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Sore Eye.

I have a six-year-old horse troubled with sore eye. About six weeks ago it commenced to get sore and watery. He keeps it closed and water runs out continuously. The eye-ball is colored light red or amber.—Subscriber.

Get the following eye medicine and introduce a few drops inside the lids five or six times daily with a curved medicine dropper. Be very careful not to injure the eye in doing so: Adrenolin, 2 drams; atropia sulphate, 8 grains; water sufficient to make 2 ounces.—R. T. W.

Worms.

I have a horse that seems to have scours, and always backs against the fence and rubs. Do you suppose the animal has worms, or what would you call it? I have treated for worms but with no result.—Subscriber.

Give your horse the following medicine for the worms: aloin, ½ oz.; turpentine, 3 oz.; linseed oil, 1 pt. Repeat in three or four days. Rub the tail with kerosene once daily until he stops rubbing it against the fence.—R. T. W.

Sweeney.

What is the best remedy for sweeney?—P. C., Escondido, Cal.

Sweeney may be caused by diseased conditions in other parts of the leg, producing either lack of use or too much exertion in this set of muscles on the shoulder. If there is disease in other parts of the leg, it must be cured or the sweeney never can.

The local treatment we have found most successful is the injection under the skin of a salt water solution, about one heaping teaspoonful of salt to one pint, boiled and strained. Inject one to four ounces under the skin with a hypodermic syringe. This treatment effects a cure in nearly every case. Repeat in two or three weeks. Or several setons or rowels made of cloth or wide tape may be passed under the skin for the distance of three inches. Put in six or eight; wash clean and move them once daily.—R. T. W.

Spavin.

I have a mare that is spavined. Can she be cured. What is the treatment?—H. M. W., Acampo.

There are different kinds of spavins. Bog spavin, a disease of the true hock joint is seldom cured. Bone spavin, a disease of several small bones and joints in the lower part of the hock, can usually be cured, at least well enough for team work. The best treatment is "firing" with a hot pointed firing iron. This should be done by a man who understands the anatomy of the part. You might make a bad matter worse. The so-called spavin cures are useless so far as I have ever seen.—R .T. W.

Swelling of Throat.

I have a three month old colt which I thought had a cold or distemper, but there seems to be something wrong about his swallowing. He nurses a little then drops his head and the milk runs out of his nostrils. He has been this way for a month and is getting worse.—H. S. G., Murrieta.

There is an edema or swelling in the pharyngeal pouch that covers the upper end of the esophagus and prevents the food from all going down into the stomach. It is rather common as a sequel to distemper, and usually rights itself in time. Continuous painting of the throat with tincture of iodine will have a beneficial effect.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.

Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

Leading place is given in the June Century to a curious piece of fiction, called "With the Coin of Her Life," the first of three stories turning on the popular superstition of thirteen at table. The authorship of these stories is not now announced, further than to say that Dr. S. Weir Mitchel, Owen Wister and Margaret Deland are the contributors to this symposium—which was suggested by a private discussion of the influence of point of view on human judgments. The stories were written without any one of the three having knowledge of the plots to b worked out by the other two.

Classified Liners

FARM LANDS FOR SALE.

FOR SALE—RIGHT IN TOWN, ORanges, Olives, Almonds; plenty other fruit for family use. Twenty acres, all in bearing. Water soft, abundant, piped through the land; turn a faucet and irrigate. On the American River, near Sacramento. Beautiful views of a picturesque country. Schools, churches, fine homes; Prohibition; railroad; electric line being surveyed from Sacramento. W. I. IDEAL FARMING.

If strawberries grew without weeding,
If cherries were rubies aglow,
If plum trees bore turquoise, the farmer
Would no longer bend over the hoe.

If each apple sold for a dollar,
And peaches would sell for a dime,
If each cabbage head were a diamond,
Wouldn't farmers have a good time?

If farmers didn't have to do chores,
If milking machines all would work,
If cow stables were all self cleaning,
Then farming would boom with a jerk.

If farmers made hay in wet weather,
If drouth did no harm to the grain,
If bugs ate nothing but thistles,
Then farm lands would pick up again.

If cobs were covered with gold coins,
Instead of with kernels of corn
We would spend our last days on the homestead
And never look blue or forlorn.

If farmers were rich like Rockefeller,
If lard paid like standard oil,
We might play golf with Carnegie,
And shirk from a lifetime of toil.

But farming is not all a poem,
We must work, we must sweat, we must glean,
So all we have said in this story,
Is much like a summer night's dream.

—Green's Fruit Grower.

PLAYING WILD INDIAN.

"YOU'RE a regular 'Tom-boy', Jess," said Molly one day to her sister, as that young lady came tumbling out of the barn door with her apron full of apples.

"Have an apple,' answered Jess, unconcernedly, burying her own white teeth in the cool, red cheek of a ripe Fameuse. "I'm off for 'Cosy House.' These apples are for supplies. We're playing 'Early Settlers Attacked by Indians' this afternoon, and I'm an Indian, and I'm going to get some turkey feathers for my hair." And off sped the "Tom-boy," practicing a war whoop as she ran.

"I hope she won't frighten the little children out of their wits," said Molly to herself, looking anxiously toward the hilltop.

It was a beautiful golden afternoon in late winter. Up in Cosy house Jess was a long time explaining the game of "Early Settlers Attacked by Indians" to the younger ones.

Tommy was to be the "Early Settler," and Donald, in a white apron and a big paper cap, his wife. Their names were Mr. and Mrs. John Smith. Davie was their little boy, and Virginia Helen the baby, as a matter of course. The "settlers" were to be peacefully lying in their little bunks, or beds, when Jess and Bob, as wild Indians, were to attack the hut and "tommyhawk" the entire family with gilt paper hatchets. The children all thought this a wonderful game, and promised to scream loudly when the attack began ,and to fall on their knees begging for mercy, just as "early settlers" always did—in pictures, you know. The little boys were delighted with their parts, but then they had not seen the costumes in which the Indians themselves intended to appear.

The nicest part of playing "Early Settlers" was the eating of provisions prepared by Jess. The round middles of the doughnuts (which, as you may know, my dears, are especially cut out for little boys) had been set apart for them; also some red apples, and a pile of brown sugar.

The Indians were so long making ready to attack that the provisions were all gone, and the "Early Settlers" had almost forgotten their parts, and were playing outdoors, when the first war whoop was heard. It sounded very horrible, and Tommy and Donald instantly ran into the log house, shut the green door, and flung themselves into their bunks heels over head, while Davie crouched in the fireplace with his arms about Freckles' soft neck. And so they waited the attack.

"Whee-oop! Whee-oop!" began the attacking Indians, pounding fiercely on the green door with their hatchets, only pretending they couldn't get in, for the door was on a crack.

"Ki-yi! Ki-yi Whee-oop! Whee-oop!" next shouted Bob and Jess together, knocking loudly against the side of the house, and making a tremendous racket with a policeman's rattle which they carried.

"We'll climb in at the windows and surprise them," whispered Jess to Bob, as she prepared for another war-whoop. And then they both ran around the little house, and jumped up at the windows.

Indian that she was, Jess was not quite prepared for the yell of fright and anguish which arose from the interior of the hut as she made her appearance. Surely, Davie was doing his part almost too well; and his shrieks awoke Virginia Helen, too, whose cries had not been counted upon. As for Donald and Tommy, they forgot their parts completely. They stood as dumb as if they had swallowed their tongues before Jess, who appeared to them in full Indian regalia, her hair drawn up in a wisp over her head, adorned with all the turkey's best tail feathers, her face outlined in purple stripes, and plenty of black paint under her eyes.

While Jess had been getting in at one window, Bob, who was very much in earnest, had stormed and taken the other, and, notwithstanding his screams (which he regarded as part of the play), was scalping his brother in the corner with graceful sweeps of his home-made tomahawk, only calling upon him to scream louder. Freckles, who didn't understand at all, now began to bark loudly.

The noise and cries soon became so loud and so perfect that Mrs. Love and Molly started up the hill in real affright to find out what was the matter. And when they arrived at the door of Cosy house they found two Indians, with most comical looks of astonishment on their mottled faces, striving to appease Davy and the baby, who were crying violently now, and, there was no doubt, in real earnest.

Jess tried hard to explain. "Why mother," said she, waving one purple hand in despair, and replacing a feather which was inclined to dangle over one ear, "the children don't play fair at all. They've forgotten their parts, and they think we're real Injuns. Even the baby doesn't know me!"

Mrs. Love could hardly keep from laughing at the mixture of paint and chagrin on Jessie's brilliantly colored face; but Molly spoke up:

"Well, I shouldn't think they would know you!" snapped she. "You wouldn't know yourself if you had a looking glass. I wouldn't have known

you myself, with a purple face and a green-striped mouth, and one black eye and one blue one, and those yellow trousers on, and all those feathers sticking out over your ears. Why, you're enough to frighten the dog!" And Molly grabbed the baby and started off for the house in disgust.

"Pooh! They're all babies. They don't know anythin' 'bout Injuns," said Bobbie, contemptuously. "Let's go out in the street and scare the horses," he added, looking down admiringly at his legs, which were elaborately trimmed with chicken feathers and little bells. But Mrs. Love would not allow any more wild Indian exhibitions that day, and so Jess and Bob went sadly home to wash their faces and dress for tea.

"He didn't want to be tommy-talked," explained Donald to Mrs. Love.

"He's a 'fraid cat,' he is!" declared Tommy, pointing to the toddling Davie.

"Where were you, then, when the Indians came?" asked Mrs. Love of the two little boys. "Weren't you afraid, too ,Tommy?"

"No, indeed!" replied the brave Tommy, promptly, adding, regardless of grammar: "Me and Donald was up the tree outside. We wasn't afraid."

And Mrs. Love smiled ,and said softly to herself: "I wonder what those children will be doing next?"—People's Home Journal.

About the House

AN old friend who is always cheerful although many burdens have fallen on her shoulders, one day handed me the following lines with the simple comment, "these words helped me, perhaps they may help others."

God broke our years to hours and days
That hour by hour and day by day,
Just going on a little way,
We might be able all along
To keep ourselves heartwhole and strong.
Should all the weight of life
Be laid across our shoulders, and the future, rife
With woe and struggle, meet us face to face
At just one place,
We could not onward go;
Our feet would stop, and so
God lays a little on us every day.
And never, I believe, on all the way
Will burdens bear so deep
Or pathways bear so steep
But we can forward go if, by God's power,
We only bear the burden of the hour.

* * *

It is said that the most famous recipe in Kansas is Mrs. John James Ingall's recipe for blackberry jam. Every summer it is published in scores of Kansas papers and "B. J." as Senator Ingalls is said to have called it, is a favorite dainty in many Kansas households. If the directions are carefully followed the jam will be first-class.

Take two gallons of blackberries, carefully pick them over, and thoroughly wash in cold water. Drain and put in a preserving kettle and pour over one quart of water. [Note.—Some cooks use only one pint of water.] Cook until soft, being careful they do not burn. Stir at intervals with a wooden spoon to break up the fruit. Remove from the fire and press all through a wire sieve into a large stone or earthen jar. Stir the pulp thoroughly. Take one quart and put into a kettle, and, when it boils, add one quart granulated sugar previously heated in the oven. [Note.—Some cooks prefer less sugar.] Bring it to a boil and let it cook rapidly 15 minutes, shaking the kettle from time to time so it will not stick to the bottom. When it begins to jelly, it is done. This can be tested by dipping a silver spoon in cold water, then take up a little hot jam and drop it slowly in a saucer. If it hardens it is done. One accustomed to preparing it generally can tell by the peculiar sound of the bubbles as they break. Pour into small, large-mouth jars. When cold, seal tightly and place in a dry closet. Paraffine covers it nicely. Never try to make more than a quart at a time. It takes no longer to prepare it this way, and is in every way better.

* * *

An exchange says that a good story is just as interesting as a piece of news, and then goes on to tell of a "Colored gun man" in darkest Missouri who was struggling homeward in the pale moonlight on the night before Christmas. Over his shoulder was a gigantic turkey. As the outraged fowl made vain efforts to free himself his captor said:

"Lookee hyar! Wot's de use ob yo' all kickin'? Among such a large cullu'd population yo' ought to know dat it am only a question ob which nigger gits you'!"

* * *

Here is another from Printer's Ink:

Tommy ,very sleepy, was saying his prayers. "Now I lay me down to sleep," he began "I pray the Lord my soul to keep."

"If,' 'his mother prompted.

"If he hollers, let him go, eny, meny, miny, mo!"—Elbepe.

THE SAVINGS AND LOAN SOCIETY
101 MONTGOMERY ST.
SAN FRANCISCO

WE have a record of fifty-two years of safe and conservative banking methods, our policy, moreover, being to treat our smallest depositor with the same courtesy and attention as is extended to the largest patron of the bank. Accounts may be opened by mail.

Hay.

Scott & Magner say: General trade in this city is very quiet, and at present we do not look for any increase in conditions until a little later on in the season. Consumers here are buying sparingly, as the general feeling is that prices that are at present being asked are above the basis the situation justifies on the new crop hay.

At the present writing conditions are unsatisfactory, the market is decidedly tender, and definitely weak.

Alfalfa hay continues to arrive in very small quantities, and as the demand is light, it is well that this condition prevails at this time. Prices are somewhat indefinite under these circumstances.

There has been very little hay shipped for Export recently, and the demand in this direction has been particularly light for some time past.

We quote the general range of prices on today's market as follows:

Choice wheat hay .....22.00@24.00
No. 1 wheat or wheat & oat 20.00@21.00
No 2 wheat or wheat & oat 17.00@19.00
Choice tame oat .....19.00@21.00
Other tame oat .....17.50@19.00
New crop wild .....13.00@16.00
Wild oat .....15.00@19.00
Stock hay .....7.00@10.00
Alaflfa .....13.00@17.00
Straw .....60@85

Grains.

Wheat No 1 .....2.10@2.11
Barley .....1.55@1.62½
Barley common to fair .....1.45@1.55
Oats white 2.20
Oats gray .....2.05@2.15
Rye new crop .....1.80@1.85
Corn Egyptain .....1.60@1.65
Corn Cal sm round .....1.80@1.85
Alfalfa seed, Cal .....16@18
Mustard yellow .....5¾@6
Mustard brown .....3¾@4½
Millet .....2½@
Broom corn seed per ton 23.50

Feed Stuff.

Rolled oats per ton .....42.00@43.00
Oil cake meal per ton .....38.50@40.00
Cocoanut cake per ton .....25.00@26.00
Middlings .....33.00@35.00
Mixed feed per ton .....28.00@32.50
Shorts .....31.00@32.50

Deciduous Market

Sacramento, Cal., May 29, 1909.

The California deciduous season opened April 22nd, when the first boxes of cherries were shipped by express. The first box sold in Philadelphia realized $31 and New York $21.

The first carload of cherries sold in Chicago, May 17th at an average of $2.77 per box for all varieties. The cherry market has held up exceptionally well, and high values have been realized up to date. The market yesterday was as follows: Chicago, Tartarians $1.15 to $2.75, Royal Annes $1.85 to $2.25, Biggereau $1.35 to $2.10, Governor Wood 90c to $1.55, Rockport $1.25 to $2.75, Chapman $1.65. A large percentage of the Placer County output of Tartarians has been shipped by express to various markets in the East and North, and has averaged f. o. b. $1.25 to $1.50. The crop of Tartarians in this part of the State is now picked and growers are receiving some very handsome returns at the present time for this variety. Royal Annes and Black Oregons are coming in quite freely, and they are going forward in iced cars to the East.

The first crate of Pringle Apricots was shipped May 15th and sold in Chicago a few days ago at the handsome price of $3.00 per crate. There are now en route small quantities of Royal, Newcastle and Seedling Cots Alexander Peaches and Cherry Plums.

The first mixed car of deciduous fruits is expected to leave Vacaville sometime next week. This car will contain Apricats, Cherries, Peaches and possibly a few Plums. The same will be sold in either New York or Chicago.

The deciduous outlook at the present time is exceptionally good, inasmuch as the crops in the East in practically every state are reported light and the crops in California are light also consequently very good values should be realized for all of our deciduous fruits.—T. C. Tucker.

Citrus Market

Los Angeles, June 2, 1909.

The orange market is materially improving, owing, in part at least, to the shrinkage in shipments. Navels are practically cleaned up. The few that remain will be gone in the next week or ten days. Seedlings, Mikes and sweets may remain a few days longer, though the trees are rapidly being cleared of all of them.

Valencias are now going forward in quantity and commanding in the neighborhood of $1.75 to $2.00 f. o. b. The outlook for a good return for the Valencias through the summer months is favorable.

Lemons are still going to the bad, at least as to the lower grade stock. First grade goods are commanding a fair price with ready sale. Poor keepers are still begging and many of them hauled to the "wash."

Shipments :

Total shipments to date since Nov. 1 aggregate 26,974 cars of which 23,541 were oranges, 3,432 cars lemons. To this date last year 23,302 cars of which 20,569 were oranges 2,733 lemons.

NEW YORK, May 28.—Twenty-seven cars oranges and one car lemons sold

he market is steady, prices unchanged. Weather clear and warm.

THE BEST LIAR.

"Doin' any good?" asked the curious individual on the bridge.

"Any good?" answered the fisherman in the creek below, "Why, I caught forty bass out o' here yesterday."

"Say, do you know who I am?" asked the man on the bridge.

The fisherman replied that he did not.

"Well, I am the county fish and game warden."

The angler, after a moment's thought, exclaimed: "Say, do you know who I am?"

"No," the officer replied.

"Well, I'm the biggest liar in Eastern Indiana," said the crafty angler, with a grin.—Recreation.

LIBERTY POLES.

An interesting feature of the early history of our country was the liberty pole, so dear to the heart of our forefathers, but generally unknown to the present generation.

Liberty poles were for the most part erected after the Revolutionary war was so long an acknowledged fact that the rebels could take time to give it some picturesque expressions.

After the republic was established no more was heard of them until the war of 1812 roused the antagonism of the people, and up went the long shafts again, each a protest against British aggression.

During the whisky insurrection in the last decade of the eighteenth century, when seven counties of Pennsylvania and Virginia arrayed themselves in defiance of the government, liberty poles shot up during the night in the rebellious towns and villages, painted a bright red, as signals of war.

Liberty poles were erected during presidential campaigns in the first part of the last century by both Whigs and Democrats.

They were usually made of white pines, lashed together until they reached a great height. The more fervid the zeal of the party the higher rose the pole. Sailors were often brought out from the seaboard to inland towns to assist in the erection and to rig flags, to the amazement and delight of the boys who knew nothing of ships or seamen.

Mass meetings were held under these poles, which were often regarded with superstitious affection. The blowing down of a pole by a high wind during a campaign chilled the hopes of one party and cheered the others.

These singular emblems of protest against oppression have wholly disappeared of late years throughout the country, except in some remote districts, where old customs are still cherished by rural communities.—Chicago Record-Herald.

The secretary of the Kansas state board of health, in his recent bulletin, says: "The fly is the disseminator of the three D's—Dirt, Diarrhoea and Disease, which often result in the three T's—Typhoid, Tuberculosis and Toxines (ptomaines), and which should teach us to cultivate the three C's—Care, Caution and Cleanliness.

FIGURE IT OUT FOR YOURSELF.

Your dairy cows are milk machines either making money for you, or they are eating their heads off. Would it not pay you to use less of high cost fodders and more sugar-beet-pulp at $1.50 per ton from the silo.

Molasses also is a very cheap and nutritious feed for all kinds of stock. See adv. on page 640.

THE PROBLEM OF SUMMER COOKING.

The weather man says it's going to be a hot summer. This is setting good housewives thinking about the kitchen work—wondering if last summer's toil and worry over a hot stove in a hot kitchen must be all gone through again—wondering if there isn't some way of roasting, toasting, broiling, frying, ironing and washing without having the kitchen like a boiler room.

There is. No longer need the approach of summer be viewed with dread by the woman who keeps house, for science has made is possible for her not only to do all her stove work quicker and better than ever before, but to do it without the kitchen temperature being intensified to any noticeable degree provided she uses a New Perfection Wick Blue Flame Oil Cook-Stove.

The "why" of it is to be found in the wonderful burners of the "New Perfection," which produce intensely hot blue flames, and yet so concentrate the heat that it is not thrown off into the room to cause discomfort. In this way the housewife is enabled to do her kitchen work in comfort—to say nothing of the time saved in lighting—of having no hot fire when the stove is not needed—of being able to get a flame of any required size at will, from one for simmering to one for quick boiling or any other purpose. In fact, while one flame is working away at full blast, the other two can be at medium and low heat—something that cannot be done with a coal or wood stove.

When washing day comes around there is no need for carrying in coal or wood—nor is there any waiting for the fire to get started. The same holds true on ironing day and baking day. All this, added to the splendid results, makes the "New Perfection" an unusually convenient stove to have in the house.

Then there is the cabinet top, which gives the "New Perfection" the appearance of a modern steel range. Its commodious top shelf is extremely useful for warming plates and keeping cooked food hot. Also has two drop shelves on which to stand the teapot and coffee pot. In fact, the "New Perfection" has every convenience—even to bars for towels.

"The "New Perfection" burns ordinary kerosene and effects no small saving in fuel expense in the course of a single season.

Another member of the "New Perfection" family is the Rayo Lamp—an all round house lamp in which illumination by means of kerosene approaches more nearly perfection than in many expensive and complicated systems of lighting. Its latest type of central draft burner and its beautiful porcelain shade unite in producing a light of great brilliancy—yet so mellow as not to tire the eyes.

Whether used in library, parlor, bedroom or dining-room the Rayo Lamp is never out of place, as it harmonizes with the furnishings of any well kept room.

The New Perfection Wick Blue Flame Oil Cook-Stove and the Rayo Lamp, combining as they do beauty, convenience and low price, should be in every home where real comfort is a consideration.

Information That Is Worth

DOLLARS

To You

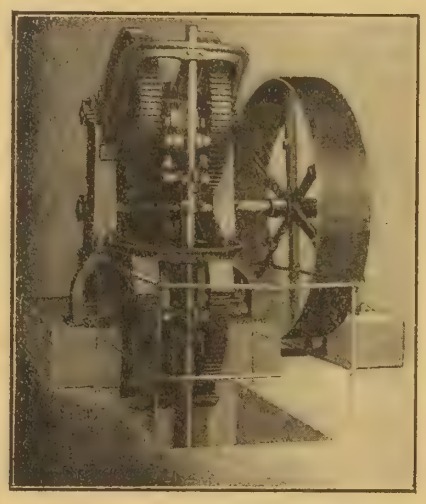
Isn't it worth money to know that with our patented vaporizer (found only on the Western) you will get from 25 to 30 per cent more power out of a gallon of low grade distillate than other engines get from a gallon of high grade gasoline? Five minutes' work with a scratch pad will show you what effect this will have on your fuel bills.

Ask us about the Nix-Frost Crude Oil Gas Producer, the cheapest power on earth using Crude Petroleum as fuel.

Western Gas Engine Company

Northern Branch: San Francisco, Cal. Los Angeles, California

The Smooth Running, Noiseless Pomona Deep Well Pump



It is thirty to fifty per cent more efficient than any centrifugal pump ever made. No high speed bearings to cut out. All breakages and rod troubles eliminated.

This is the only pump you can afford to buy if you consider your own interests. Hundreds of satisfied users testify to this.

Used by the best water companies who know what a good pump is.

Send for a catalog or what is better come to POMONA and let us show you some of these plants in operation.

POMONA MANUFACTURING CO.
POMONA, CALIFORNIA

THE Latest Deep Well Turbine Pump

Guaranteed to deliver from 100 gallons per minute upwards, depending on the diameter and capacity of well, from a depth of 50 to 300 feet below the surface. Can be either belt driven or direct connected to electric motor as occasion requires.

Write for Catalogue 46B.

A deep well pump that has no valves or plungers to wear or get out of order, no gears, consequently no noise or breaking of teeth.

Compact, durable, always primed and ready to operate, constant flow, hence increased capacity of well.

This type of pump is fast taking the place of Vertical Steam, Deep well Plunger and Propeller Pumps.

Future Citizens of Kerman, California

J. W. Brooks, J. B. Deardorff, J. W. Lamb, J. W. Cook, E. M. D. Smith, C. E. Wells, C. F. Anderson and L. W. Brooks, all of Towner Co., N. D. Together they bought 220 acres of land March 18, and will help to make Kerman the richest colony in California.

Do You Know

That the east is burning up with land hunger? That productive lands are getting scarce and hence higher? Do you know that the people east are just beginning to find out that there are agricultural lands in California and hence that we are on the eve of the greatest emigration movement California has ever experienced.

Do You Know

That as a consequence it behooves all who are landless in California but who hope sometime to enjoy the blessings of a landed home, to get busy and to secure the home before the other fellow gets it, and before prices have advanced to where they are prohibitive? That the easterners who are coming here now are astounded with the agricultural possibilities of "New California?" That they are buying themselves, and then going back home spreading the news of their find, and inducing others to come?

Do You Know

That ere long the man who owns productive land here will discover its value, and will refuse to part with it at several times the amount it now takes to "lift" it, and that when that time comes it will be everlastingly too late for many.

Do You Know

That the value of land depends upon what it will produce per acre? That land on the **Kerman Tract** is today the cheapest land in the United States, value of possible products considered? That this fact is becoming known, and that it is bringing more people here than have ever come to any other similar tract in the same length of time?

Do You Know

That the **Kerman Tract** excels when it comes to water right, quality and lay of soil, natural drainage, location, and in possibilities for fruit and alfalfa growing, dairying and poultry raising? That it is unsurpassed, if equalled, in the things that go to both home and money making? That it is being populated by the very best quality of people, the cream of the country? That undesirable people are not allowed to buy land here and that those who locate are protected against the scourge which has ruined so many otherwise promising colonies in California? If you do not know these things now

We Are Telling You

And we ask the privilege of further informing you. If you are interested we would like nothing better than the chance to satisfy you upon all these points, either by correspondence or by showing you over the tract. We consider it a pleasure to show interested visitors over the colony, and all comers are accorded courteous and considerate treatment. Our circular explains in detail what is here, and it is free for the asking. Write for it, and do it now. But, what is better, come here and satisfy yourself that the **Kerman Tract** is as represented, and that you are not missing something that cannot be retrieved by not taking advantage of this opportunity now. The Education of the Farm Boy

Extracts from an Address by George W. Pierce of Davis at the State Farm Picnic Held There May 22d This Year

GIVE the farm boy an equal chance with every other boy of this land. The business he is to follow is of importance enough to entitle him to the best any country can give. All difficulties resolve themselves in the end into a question of education. Knowing how, is the key to the situation. Education today has come to have vastly more importance than the mere establishing and maintaining of schools. It goes into all kinds of work and reaches mature persons as well as the youth. Properly administered it teaches us how to live.

Agriculture is a science. It is an exacting task master. Recent developments along modern lines have been much greater in the city than they have in the country. An exodus from the country to the city has been the result. The country, the source of the real wealth and foundation on which the perpetuity of our nation stands must be made more attractive. Many a boy has been driven from the farm to the city because of the lack of progressive methods. He was ambitious and present farm methods did not outline channels for his ambition. The country lost a gem and the city gained a slave. The material of which a man of worth to his state and nation might have been is swallowed up in that vast seething mass of humanity where the individual is known chiefly by number. The education the boy was given was and is faulty. Now, my farmer friend, do not attempt to shun a responsibility and say you sent your boy to school and thus did your duty. Much of that boy's education was gained on the farm. For much that is faulty in that education, in the school, on the farm or on the streets of the adjacent town you are responsible.

Your boy is being fitted not for the grandest but for the greatest of all callings. He should have a technical education that will quality him for the work. Let us inquire into the magnitude of farm operations as compared with some others and then we may be in better understanding of the question and can answer more intelligently "What should constitute the education of the farm boy?"

According to the census of 1900, the value the farm property of the United States was twenty-one billion dollars. The value of the out put of the farms for 1908 was, in round numbers, eight billion dollars. Can you comprehend it? No, you are lost before you get beyond the returns of your own country. Eight billion dollars not coined but actually created, brought into existence annually by the farmers of America. Should we have experts at the helm?

Compare this with the output of gold in 1907. Eighty-nine million dollars is what the gold mines have to their credit, practically one-hundredth part as much as the farms returned.

* * * * *

The total production of the gold and silver mines since the discovery of America by Columbus has been five billion dollars. According to reliable statistics the cost of all the railroads of the United States, together with all their equipment, has been thirteen billion dollars, and the entire revenue from both freight and passenger traffic was a little over two and one half billion dollars in 1907. So the income of the great transportation companies is less than one-third that of the farms.

These railroads are a small affair when compared with the fertile fields and bursting granaries of the farmers of America. And yet we hear that great political influence is exercised by these same companies; that nominations are dictated, legislatures controlled and legislation advanced or thwarted at their pleasure. They are doing this on one one-half the investment and one-third the income of the farmers of the same territory. What are the farmers doing? Do they initiate measures for the relief of their calling? Do they dictate terms with those who are dependent upon them? Even the resistance of the farmer is feeble in exceptional cases. The bewildering amount of capital invested in farms demands that better farming, better business methods be put into practice. To be attractive farming must not only be profitable but it must be a congenial occupation. If you would have your boy stay on the farm give him an interest in it in some way. Let him have a plat of ground to cultivate, or give him some stock. On the successful management of these make him rely, to some extent, for his spending money. You will then teach him habits of thrift and arouse an interest in the business. Do not fail to make your home attractive by the growth of trees, vines and shrubs. The farm boy has a right to demand this. It is a duty you owe the State.

Let us go farther with with our comparisons. Turning to finance we find that the entire banking capital of the United States, including the National, State, Savings and private banks, and Building and Loan Associations, is less than two billion dollars. This is less than one-tenth part of the capital invested in the farms, yet finance demands the services of our brightest and most highly trained men.

Is there necessity for better methods and larger returns from the farm? Thirty years ago we produced ten bushels of wheat per capita. Increased exports are called for from importing countries and our exports are diminishing. The state recognizes the necessity of educating the farm boy and of educating him along those lines that will make of him the most capable farmer. All education should tend first to the development of a citizen of a high order. On this foundation build the specialist.

Agricultural education as such began about the year 1857, in the University of Michigan. It has extended until today every state and territory of the United States is teaching agriculture. Even distant Hawaii has fallen into line. California has appropriated thus far one-half million dollars for its school of agriculture at Davis, but the success or failure of the institution is in the hands of the farmers.

The nation has recognized the importance of the farmer's calling and some months ago ex-president Roosevelt appointed a Commission on Country Life. In its report it recommends many reforms. Time will not permit an extended review of this valuable document. The organization of farmers for mutual improvement and protection is advocated. "The ultimate need of the open country is the development of community effort and of social resources."

"If the farmer suffers because his business is small, isolated, and unsyndicated, then it is the part of the Government to see that he has a natural opportunity among his fellows and a square deal." I quote once more from this report, this time regarding the liquor question: "The Commission has made no inquiry into intemperance as such, but it is impressed, from the testimony that has accumulated, that drunkenness is often a very serious menace to country life, and that the saloon is an institution that must be banished from at least all country districts and rural towns if our agricultural interests are to develop to the extent to which they are capable. There is nothing local about that. Its application extends from ocean to ocean."

How are the farmers of California faring in this respect? Generous as has been the state in its appropriations for the agricultural education, so far as its protection of the farm youth from the effects of the liquor traffic are concerned, its course has been niggardly. The California farmer because of his lack of effective organization has been victimized. Let me call your attention to that section of the Penal Code of the state that guarantees protection to certain State Institutions.

It is made a misdemeanor to sell, give away, or expose for sale, any intoxicating, vinous or alcoholic liquors within half a mile of the land upon which any state prison is situated. This prohibition cannot affect the convicts as they are denied access to the grog shop. It can only be for the guards. The last Legislature decided that those state prison guards are of more importance to the state than are the farm boys, for it declined to give this University Farm School the same protection it vouchsafed to the prison guard. Farmer friend, how do you like your rating?

It is made a misdemeanor to sell liquor within nineteen hundred feet of any reform school, but sales can be lawfully made within the shadow of this very building. The state subjects the farmer's boy to temptation, and should he fall will confine him in a reformatory, exclude for a distance of nineteen hundred feet the cause of his degradation, and claims to have done its duty to the farmer. Farmers, are you satisfied? Do you believe you have had a square deal?

It is unlawful to sell liquor within one mile of the University of California. This institution is a part of the University of California. Why has this discrimination against the farm boy been made? Stanford University also enjoys freedom from the liquor seller. It is right that it should. In the opinion of the last Legislature the farm boy is not worthy of any protection.

We find that the criminal, the indigent, the political dependent, the young men at the universities, the pages at the legislature, are all protected, while similar protection for the farmer's son at this institution is denied. Farmers, are you going to tamely submit to this injustice? Rather let us rise, as a class, from one end of the state to the other and demand in an emphatic manner that the environments of the farm boy, while obtaining a technical education at the State Farm, have incorporated in them at least

RUSSET ORANGES.

A BULLETIN of the Florida Experiment Station gives information as to control of rust mite which was at one time claimed to "benefit oranges" by making them sweeter. Apparently its benefits are not appreciated and an effort is made for its control.

Usually the rust mite does not occur in a grove later than the middle of July. Last year, however, it continued to work vigorously late in the fall, and in some groves as late as into January, causing bright fruit to russet even after it had become ripe. Last spring was also exceptional in regard to the activities of this little pest. Ordinarily it need give us no concern before the middle of May. Many of us, however, were unpleasantly surprised to find that the crop of fruit had been greatly damaged by it before the first of May.

How to Detect Rust Mites.

The rust mite is the smallest animal belonging to the spider-mite family. A single individual can not be seen by the ordinary eye. Nearly every one, however, can detect rust mites by the unaided eye when they occur in countless numbers on citrus fruits, as they are likely to do some time during May. They may be detected on the fruit by a very delicate light coloring, as if the fruit had been dusted from a roadside. When this inconspicuous dusty appearance occurs, one should use the hand lens to determine whether this condition is due to dust which has risen from the soil, or whether it is due to myriads of rust mites on the fruit. If it is found that the rust mite is present, this is a signal for immediate action.

How to Prevent Rusting.

The rust mite like other spider mites, is extremely sensitive to sulphur compounds; consequently we have a cheap remedy in almost all kinds of sulphur mixtures. The most effective, and at the same time, one of the cheapest, is the sulphur spray, made of sulphur and caustic soda. The lime and sulphur mixture is also very effective. Only two quarts of these solutions are usually needed to forty or fifty gallons of water.

A less effective, though somewhat cheaper, method of treating rust mite, is by means of flowers of sulphur. This is a fine powder of brimstone, and may be applied by a powder gun. Before the invention of these powder guns, people treated citrus groves effectively by throwing handfuls of powdered sulphur into the trees. A mixture of flowers of sulphur with about three parts of air-slacked lime is a little more easily applied, and sticks to the leaves better than the sulphur alone. By mixing the lime with the sulphur the workmen are able to see what parts of the trees have been treated, and so to do the work more thoroughly.

The dry insecticides for rust mite have their disadvantages, however, in that they should only be applied when the trees are moist with dew. In a large grove this requires much night work, to which most laborers object.

Other forms of contact insecticide may be used more or less effectively, but should be avoided unless one has in mind the double purpose of destroying rust mite and scale insects at the same time.

Irrigation.

A grove that is kept thoroughly irrigated is not apt to be badly affected by rust mite, since these mites do not endure a moist atmosphere. It is, however, not safe to rely upon an irrigating plant as a preventive of russeting oranges.

STATE INSECTARY.

The work accomplished by the new insectary at Sacramento is as yet hardly pronounced enough to be generally observed, but we believed it has placed the state horticultural commission in a situation to distribute insect friends better than it ever has before. This insectary was dedicated for its uses last December, and since that time the work has been primarily to get insects installed and ready for distribution. Distribution began, of course, months ago, but only last week it was given such a swing by the sending out at one time of 238 colonies of comys fusca which were sent into the apricot and prune sections of the state to dispose of the brown apricot scale. Commissioner Jeffrey says that this one day's shipment was, "the largest shipment of insect parasites perhaps ever made at one time." He further adds, "The success in handling this particular parasite is largely due to the facilities offered by this new insectary. We find everything favorable in this location to the propagation of beneficial insects. We have also received a large shipment of infested material from South Africa, from which we hope to breed out a large number of body parasites for the black scale. These little flies attack the scale in its immature form, and being body parasites should be of great assistance to the Scutellista in maintaining control of the black scale. Perhaps a dozen colonies of these South African parasites have already been liberated in different parts of the state, and we hope within a short time to determine whether they may be established here . We are also sending out a very large number of parasites for the codling moth, and we find no difficulty in keeping the orders for Vedalia filled from our breeding cages. In short the Insectary is doing well, and is absorbing a great deal of attention from all the members of the staff."

BLACK ANTS EAT SCALE?

The following is from a dispatch appearing in papers all over the state, purporting to come from Ukiah, Mendocino county. It would appear that all our citrus growers have to do now is to carry their ants about on a plate of sugar. The scheme surely must be "worth millions:"

Professor Harlan, who is visiting in this city, but hails from the southern part of the State, has discovered that the ordinary black ant will remove the scale from fruit trees without injurying the trees or leaves in the least. He says their work is more complete than that accomplished by spraying or by any of the imported insects.

The ants are captured by placing a plate of sugar near an ant hill, and when covered with ants the plate is put in the forks of the infected tree. The ants leave the sugar and go to work on the scale. As soon as they all leave the sugar the plate is placed at the foot of the tree and as the ants

come down after having cleaned the tree of scale they again assemble on the sugar, and are thus easily removed to another tree.

Several ranchers in this section have tried the scheme, and estimate that it will be worth millions of dollars to fruit growers.

PAINT POINTERS.

Nothing is superior to linseed oil and white lead as a priming coat.

A priming, or first coat, should be put on as soon as the lumber is exposed to the weather.

All nail holes should be carefully puttied after the first coat is applied.

Three coat work, rightly done, is better than two, because the painter has to flow his paint on too thickly in the latter case.

The writer has used a great deal of both kinds, and prefers a good grade mixed paint to anything the average painter can mix up, because he cannot combine the lead and oil as thoroughly as they do it in the grinding machines at the paint factory.

It pays to hire a painter—not a "Thinks-He-Izzer," but a painter. Anybody can daub paint; it takes experience to properly paint even a woodshed.

Knots should be "killed" with a coating of shellac.

Turpentine deadens the luster of paint, and its excessive use is one cause of peeling.

A good brush saves its cost the first half day.

When using a new brush, dip it into the paint—work the paint all through the bristles—then "spat it out" on a board, and leave it over night—full of paint, remember! This will set the bristles, and keep them from curling. Continue the practice for several days.

Don't let the painter put the second coat on before the first is thoroughly dry. Many a fine house has been spoiled by getting into a hurry right here. A week is short enough time between coats, and two weeks is better.

See to it that the under edges of the clapboards are all painted.

In painting old work, all scaly paint must be removed, and if any spots are bare of paint, these must be covered with a priming coat before an even finishing coat can be secured .

Because of the extra covering quality of good paint, and its better measure per can, such paint is cheaper in dollars and cents than the inferior grades often exploited; besides this, good paint will outwear the poor all the way from 10 to 100 per cent.

The common estimates for amount of paint required to cover a given surface are for new pine lumber. Allowance must be made for work that is old and weather cracked.

Never paint while the surface is damp. A heavy dew or light mist is sufficient to stop work until the bottoms of the clapboards are thoroughly dry.

Do your own figuring—your dealer will help you—and save the profit the painter too often makes from buying more paint than he needs, charging it to you, and using it—again charged—on some other job. There are honest painters—most of them are—and then there are the other kind.

But whether or not you follow any of these suggestions, keep the buildings well painted, partly to save deterioration in their value, partly to advertise the fact that a wide-awake and progressive man lives at your house, partly to enhance the possible selling price of your property.—Farm, Stock and Home.

These Farmers are Building a

Rural Telephone Line

It is the most valuable thing for a community to possess. It puts the doctor, merchant, broker, depot, post office, relatives and friends all within immediate reach. It protects the home and does away with the isolation of farm life that drives the boys and girls to the big cities.

Have You a Rural Telephone?

If you have not, ***cut out this advertisement, write your name and address on the margin and mail it to our nearest house to-day.*** Upon receipt of your address we will send you at once a copy of our Free Bulletin No. 71 on

"How to Build Rural Telephone Lines and their Costs"

We have sold nearly fifty thousand farmers' telephones since March 1st.

The cost is very low where each subscriber helps build the line. Get your family doctor and merchant interested, it helps them and the whole community as well as you.

Deciduous Fruit Culture

By J. W. Mills

PLACE OF NUTS IN THE DIET.

IT HAS been shown by numerous investigations that nuts are rich in protein and fat and that these nutrients can be fairly well assimilated. Nuts being such a concentrated food, their proper place in the diet is a matter for more careful consideration than is the case with many of the ordinary food materials. It must not be forgotten that a certain bulkiness of the diet is conducive to its normal assimilation, and that too concentrated nutriment is often the cause of digestive disturbances. It might be expected, then, that nuts could be most advantageously used in connection with more bulky foods, such as fruits, vegetables, breads, crackers, etc. Most rationally used, they should constitute an integral part of the menu rather than supplement an already abundant meal. Since nuts are so concentrated, eating a considerable quantity out of hand at odd times will mean an over-supply of food if a corresponding reduction is not made in the quantity of other foods eaten during the day. The distress sometimes experienced when nuts are eaten is undoubtedly often due to improper mastication or to overindulgence, since investigations made at the California station indicate clearly that considerable quantities of nuts properly eaten do not cause distress. There is a popular belief that a little salt with nuts prevents the digestive disturbance resulting from eating them. To most persons salt undoubtedly adds to the palatability of the nuts, but no investigations have been found on record which demonstrate any actual improvement in the digestibility of nuts due to salt.

Considering all kinds, nuts are perhaps more often eaten raw than cooked, though some sorts like the peanut, which is not generally considered palatable raw, and the cashew nut, which is poisonous until roasted, are quite generally cooked.

In this country the native chestnut is very commonly eaten raw, and the small native nuts have a distinct and characteristic flavor. The European chestnut, when raw, is lacking in flavor and so is almost universally cooked. The Japanese chestnut is much like the European in its characteristics.

The cocoanut and the almond are important ingredients of many sorts of cakes and confectionery, and often nuts are used in cooking in many ways.

Nuts may be readily used as staple articles of diet, as an ingredient in salads and in soups, as a stuffing for poultry, in the making of desserts,, and in many other ways. Wild turkey stuffed with pecan nuts is a dish popular with old Virginia cooks, just as goose stuffed with chestnuts is prized in Germany. Salted nuts and nuts crystallized in sugar are very common accompaniments of other foods. In general, the nuts rich in protein and fat should be used in combination with carbohydrate foods, as bread, fruit, green vegetables, etc., while such nuts as the chestnut, which do not contain much protein or fat, but are rich in carbohydrates, may be properly combined with meats, milk and cream, eggs, and other foods containing protein and fat.

Since nuts are relished by most persons, are nutritious, and may be readily used by themselves and in various palatable combinations as an integral part of the diet, they have a legitimate place in the menu. Those who, for any reason, wish to live on vegetable foods and dairy products or any form of vegetarian or fruitarian diet will almost inevitably look to nuts, particularly such as the peanut, for a considerable portion of their total nutritive material. A fruit and nut diet may be arranged to furnish sufficient protein, mainly from nuts, to satisfy the requirements of the body, but the consensus of opinion of well-informed physiologists seems to be that such a diet is not generally advisable nor to be recommended for

THE OLDEST SAVINGS BANK IN CALIFORNIA

the majority of mankind in place of the more usual mixed diet. It should also be remembered that numerous experiments have shown that the protein from mixed diet has a higher coefficient of digestibility than nut protein, which indicates that the protein of nuts is the less economically utilized by the body. The argument which is so often advanced that primitive man lived on nuts and fruits exclusively and hence his descendants should do so is not generally accepted.

The comparatively high price of many of the edible nuts, particularly when shelled, and the difficulty of cracking some varieties—like pecans, black walnuts, and hickory nuts—and extracting the kernels at home, greatly militate against the freer use of nuts in the household. The consumption of peanuts and English walnuts is perhaps increasing faster than that of some other nuts; but, whatever sort is selected, they should, as already noted, form a part of the diet and not supplement an already sufficient meal.—Bulletin 332 U. S. Dept. Agriculture.

ST. JOHN'S BROD TREE.

The writer has recently visited the famous Escondido Valley in California, where a number of German families who have lately settled there, and whom he met, are on the lookout continually for good locations for friends, says a correspondent in Greens Fruit Grower of N. Y. Not long ago three Germans stopped at the home of Rev. R. L. Vickers near the upper end of the valley, to look over it with an idea of investing. Their attention was called to a handsome tree in the yard, which Mrs. Vickers called a "Palestine tree." The ground beneath it was covered with pods of a dark chocolate color and about five or six inches long by an inch wide and half an inch thick. The Germans instantly recognized it as a locust tree, known and highly prized in Germany as "St. John's Brod Tree." The pods with which the ground was littered and the branches hanging full are the same edible locust pods on which St. John the Baptist subsisted in the wilderness of Judea.

"And the same John had his raiment of camel's hair, and a leathern girdle about his loins; and his meat was locusts and wild honey."—Matt. iii:4.

The Germans were delighted, and eagerly filled their pockets and ate the toothsome pods, and with the permission of the owners carried away a large quantity of them. They taste very much like a combination of dried dates and raisins. They will keep for years in this dry condition, and are always ready for eating. The Germans say that the tree is very valuable, and now that seeds can be had, there will be many of them grown in Escondido Valley. The owners of the tree have been using the pods for fuel, but when they know that German families will be glad to get them at a fair price per pound they will likely take better care of them.

A NEW ALMOND.

We recently saw several branches from a new variety of almond discovered by J. C. Oestergard of Burbank and propagated by him at his ranch. Every one of these branches was covered with fruit from tip to base. In fact, so heavily were they loaded that thinning would have to be resorted to in order to save the trees from breaking. Mr. Oestergard says this is not the only season in which they have been heavily loaded with fruit, for every year since they have come into bearing they have exhibited the same tendency. He believes them to be a most valuable new variety of almond which will prove very profitable.

Failure to set fruit is not always due to imperfect fertilization. Efficiency of pollen varies with the conditions of the tree and environment. Some of the main factors which govern the pollination are vigor, variety, health, age, heredity and vitality of the tree. Most all varieties of fruit are improved by cross-fertilization and a large orchard should be planted with one-third of the trees as pollen producers. It is known that the same varieties do not blossom the same time in different parts of the state, but like condition will affect the same varieties similarly. Varieties that are useful for producing pollen must blossom at the same time the desired varieties bloom and the pollen must be potent on that variety. Up to the present time all the work in pollination has shown the following apple varieties to be more or less sterile and should not be planted alone: Northern Spy, Gravenstein, Grimes, Tompkin's King, Red Astrachan, Esopus Spitzenburg, York Imperial, Belleflower, Winesap and Willow Twig. The self-fertile are: Rome Beauty, Jonathan, Ben Davis, Oldenburg, R. I. Greening, Fallawater, Baldwin and Yellow Transparent. The pear varieties considered self-sterile are: Anjou, Bartlett, Bosc, Clairgeau, Clapp, Columbia, Gray Doyenne, Easter, Howell, Idaho, Jones Seedling, Kieffer, Lawrence, Louise, Mt. Vernon, Pound, Sheldon, Superfine and Winter Nellis. Those considered self-fertile are: Buffum, Angouleme, Elizabeth, Flemish Beauty, Le Conte, Seckel, Tyson and White Doyenne.—Field and Farm.

Hay Presses

Fourteen years ago we began selling the **Eagle Hay Press.** During this time we have sold over 600 of these presses, and as near as we can learn there is not a second hand Eagle Press for sale today This, we believe, is the best hay press record of any make sold on the coast. The press, as made today, is, without a doubt, the strongest, best and longest lived press on the market. The question is: Will it pay you to experiment when you know that you can get a tried, and not found wanting, press.

A word in favor of the **Columbia Ann Arbor Belt Power Hay Press:** Three years ago we started to sell these power presses. We now have in the field, and orders written up which will go into the field within the next ten days, 34 of these presses. Last year one of our 17 x 22 steel frame power presses bailed 3800 tons of hay, and averaged a little over 53 tons per day. This is a record that we can assure you no other press has ever made in this territory, or anything near it. If you are a friend to yourself you will thoroughly investigate the power hay presses before placing your order for a press with anyone. We court the closest investigation, as we have the conclusive evidence that we have what you are seeking. You will find us at 110-112 North Los Angeles St.

Live Stock and Dairy

By Mrs. Minna E. Sherman

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

BUTTER FROM ONE COW.

TODAY, rather than bother with butter making from the milk of one or two cows, the farmer's wife buys the family butter. There are other things I would rather buy than butter, though I most assuredly do not believe that the farmer's wife should do all the inside work of the home, sew, milk the cow, care for the chickens, and do whatever no one else wishes to do, with the trifling chore of making garden on the side, and, when everything else was done, sewing rags into carpets and making quilts out of the larger pieces. These were the "good old times" when the women stayed at home and grew more and more nervous, and even went mad with the driving push of work all unnecessary to be done. The men never took it so hard, for where was the man who did not find time to hang the reins on the plow and stroll to the fence to listen to the talk of the passer-by? Or when did he not have time to saunter to the store and hear the tattle of the neighborhood? Thank God that today the creamery takes in the milk and the farmer's wife takes in the club! The outlying districts in clubdom are the ones that study Shakespeare and Browning—something as far from the everyday grind as possible. It was an odd experience, when I was chairman of Household Economics in the State Federation of Women's Clubs, to find that the city women with maids were studying household economics while few country clubs were interested at all in the subject.

Cream.

The milk comes into the house warm from the cow, and the portion intended for butter should be poured into its own pan to be left undisturbed by skimming. Set the milk where the temperature is about 60 degrees, and after about eighteen to twenty-four hours, skim the cream off the clabbered milk and stir well into the cream already in the jar. Sometimes a little salt added to this cream will keep down undesirable bitterness. A teaspoonful to a pint of cream will not make the butter too salty if no more is added. The second or third day, or as soon as the cream is thick and slightly acid, it should be churned. In cold weather, to make the cream acid, it may be necessary to warm it by standing the jar in a pan of hot water for a couple of hours until the cream is up to eighty or ninety degrees, then cover and put in a cold place. In ten hours it will be thick enough to churn well.

Churning.

No cream should be added to that being ripened for churning within twelve hours of churning time, as it will not be sufficiently ripened and the butter fat will be lost in the buttermilk. When the butter is the size of small grains of wheat, let off the butter milk and cover the butter with water a few degrees colder than the churning temperature. Let stand while the butter bowl is being scalded and rubbed with dry salt. Rock the churn slightly to separate the grains of butter, and let out the buttermilk between times. Let off the water first added and cover again with water, adding salt at the rate of an ounce and a half to each pound of butter. Rock the churn for half a minute to mix in the salt, then turn it slowly completely over and over to ball the butter into a mass. Turn off the water and gather up the butter with two paddles and put into the butter bowl. Stand away covered for two hours to prevent the butter from being soft and oily. Then work it by compressing to release the excess of water. Butter working is done with caressing little pats rather than by main strength and awkwardness. Kneading bread is good muscle making work and is the craft, while butter working is the art that enriches the bread and must be the work of love to be perfect. Like all true art, however humble, it is the love of making a perfect thing. Art craft work is more enjoyed in the home when it takes the form of making good bread and butter rather than of clumsily tacking together and crookedly glueing furniture which may be made after good models, but distorted into grotesqueness.

Irregular Conditions.

These are vexing in handling the milk of one cow. The cream does not rise properly, or it turns bitter or rancid before churning time. To prevent these conditions it is advisable to go over all the utensils with scalding water and then with cool lime water, turning them upside down to drain dry. The fact is that bacteria are minute and hard to reach and may readily escape what is known as domestic cleanliness, which is far from being laboratory cleanliness. The first thing a woman thinks of is to wipe a pan dry with a towel. That habit must be unlearned, for unless the towel has been baked till it is sterile, it will contain a part of everything it has touched. The first difficulty to be met is quick and complete creaming of the milk. This can be overcome by putting from a pint to a quart of hot water (not boiling, but hot) in the bottom of a pan and standing the milk in it to reach a temperature of not higher than 60 degrees. As the milk cools, the cream comes quickly to the top. This method of raising cream is particularly good when a cow has been in milking some time, or is on dry feed, or in cold weather. Under these last named conditions the cream should be churned at 60 degrees. Thin cream too is churned at this high temperature.—M. E. Sherman.

ORIGIN OF THE RECENT OUTBREAK OF FOOT-AND-MOUTH DISEASE.

The recent outbreak of foot-and-mouth disease in Michigan, New York, Pennsylvania, and Maryland started from calves used in the propagation of smallpox vaccine virus which had been contaminated with the virus of foot-and-mouth disease, and the contaminated strain of vaccine originally came from a foreign country. These are the conclusions from an investigation made jointly by the Bureau of Animal Industry of the Department of Agriculture and the Public Health and Marine-Hospital Service of the Treasury Department, a report of which has just been issued.

Foot-and-mouth disease was dis-

covered among cattle in Pennsylvania November 10, 1908, and was reported to the Department of Agriculture by the State veterinarian of Pennsylvania. A few days later it was found also in Michigan, New York, and Maryland. In view of the strict quarantine maintained by the Department of Agriculture on imported live stock and the fact that the importation of ruminants from countries where this disease existed was prohibited entirely, the Department considered it highly improbable that the infection was brought in with animals. When, therefore, the disease was traced by inspectors of the Bureau of Animal Industry to calves that had been used for vaccine by a Detroit establishment, and the cases of longest standing were found among these calves, these facts caused Secretary of Agriculture James Wilson and Dr. A. D. Melvin, Chief of the Bureau of Animal Industry, both of whom had gone to Detroit to make a personal investigation of the outbreak, to suspect that the vaccine was contaminated with the virus of foot-and-mouth disease.

The main facts regarding the outbreak as brought out in the report are as follows: The H. K. Mulford Company of Glen Olden, Pa., imported certain smallpox vaccine virus which was contaminated with the infection of foot-and-mouth disease. In May, 1908, some vaccine of this strain was procured by Parke, Davis & Co., of Detroit. Calves used by the latter firm in propagating vaccine, were sent October 16 to the Detroit stock yards and thence on the same day to a farm near Detroit. On October 20 three carloads of cattle from points in Michigan reached the Detroit stock yards and were put into the pens that had been occupied by the vaccine calves four days previously. Some were sold for slaughter at Detroit, while the remainder were shipped to Buffalo and some were reshipped to Danville and Watsontown, Pa., where the disease was first observed some days later. The disease spread to various places in Pennsylvania and New York and to one locality in Maryland.

According to Doctors Mohler and Rosenau, foot-and-mouth disease is primarily and principally a disease of cattle, and affects man only secondarily and casually. Children are occasionally infected by drinking unboiled milk during the periods in which the disease is prevalent in the neighborhood, while persons in charge of diseased animals may become infected through contact with the diseased parts or by milking, slaughtering, or caring for the animals. The disease when communicated to man, however, is very seldom fatal, the affection usually being too slight to come to the notice of the family physician.

As soon as the facts regarding the contamination of vaccine became known, the licenses of the two firms involved were at once suspended, all the suspected vaccine virus on hand was destroyed and that upon the market withdrawn, and other measures of a radical nature were taken. The report commends the intelligent and prompt co-operation of the Mulford Company and Parke, Davis & Co., in accomplishing this end. After an examination of every strain of vaccine upon the market, it is stated that there is now upon the market no vaccine contaminated with the virus of foot-and-mouth disease. Regulations have been formulated with a view to preventing hereafter the propagation of contaminated vaccine virus. No instance of the transmission of foot-and-mouth disease to man through vaccine virus has been recorded, and it is considered doubtful, in view of the tests made, if it is possible to reproduce the disease in him by the cutaneous inoculation commonly used in the process of vaccination.

The recent outbreak of foot-and-mouth disease in live stock has been eradicated after vigorous work by the Bureau of Animal Industry in co-operation with State authorities, involving the expenditure of $300,000 by the Federal Government alone. The quarantine on the last of the infected territory was removed April 24.

Cream Separator DISCS

Unscrupulous competitors, struggling desperately to retain any separator business, are making such reckless statements as to separator "DISCS" that a few words more on our part may not be amiss.

DE LAVAL "DISCS" are as necessary to the bowl of the cream separator as teeth to the human mouth.

A man can chew without teeth and you can separate without "DISCS", but in both cases at a great disadvantage.

So far as imitating "DISC" separators are concerned, they compare with the IMPROVED DE LAVAL about as artificial teeth do with a perfect set of natural ones.

The DE LAVAL COMPANY owned the first "HOLLOW" bowl and the first "DISC" bowl and have originated all the improvements upon both. Hence they are free to use the best and any combination of the best features, while would-be competitors are forced to get along with ten to thirty year old types of construction upon which DE LAVAL patents have expired.

DE LAVAL "DISCS" fully double the capacity of any separator bowl of the same size at the same speed.

DE LAVAL "DISCS" fully double the separating efficiency of any separator bowl of the same size at the same speed, and enable a perfect separation that is not possible otherwise.

The saving in size of bowl and in necessary speed makes possible much easier running, and more than doubles the life of the separator when built equally well.

But other separators are not built as well as the DE LAVAL, so that the average life of a DE LAVAL separator is five times that of the average would-be competing separator.

DE LAVAL "DISCS" make possible the skimming of cool milk, which cannot be done with most other separators at all, and if at all only with greatly increased butter-fat losses in the skimmilk.

DE LAVAL "DISCS" make possible the running of heavy cream, 40% to 50% butter-fat, with its tremendous advantage in creamery patronage, which is either impossible with other separators or can only be done with greatly increased butter-fat losses in the skimmilk.

DE LAVAL "DISCS" enable the construction of a bowl in the LATEST IMPROVED DE LAVAL SEPARATORS that is quickly and easily cleaned and absolutely sanitary, a combination of most important advantages not to be found in any other separator made.

DE LAVAL separators cost no more than would-be competing separators of relative actual capacity, save their cost every year, and last from two to ten times as long.

98% of the experienced users of FACTORY cream separators now use DE LAVAL machines. The great majority of FARM separator users are already doing so, and within five years we sincerely believe the use of DE LAVAL separators will be UNIVERSAL.

A DE LAVAL catalogue explaining all of the above points is to be had for the asking, as well as an IMPROVED DE LAVAL machine for practical demonstration of them to every intending separator buyer.

The Ornamental Garden

THIS MONTH.

THE Bermuda or joint grass is being encouraged by this kind of weather, and the careful lawn grower who would keep this pest out must be very watchful. We know that many who are not too fastidious have dropped into the habit of letting Bermuda have entire possession of the lawn, and maintain that it makes a fairly good sward. This is to a certain extent true during the summer, but in the winter when cold weather comes, it turns as brown as the road, though still a heavy sward. There is nothing equal to blue grass, if kept perfectly clear of joint grass.

PRUNING SHADE TREES.

From a paper read before the Minnesota Horticultural Society by Theo. Worth, Supt. of the Minneapolis public parks, the following valuable points are taken:

There should always be a certain desirable object in view when a tree or shrub is pruned. Much of it is done because it is thought customary without any plausible reason to justify that custom. There are two classes of tree butchers—the line men of telephone and other companies, slashing trees in ignorance, and the less willful but equally ignorant tree butcher who has no special object in view when he prunes. The object of this paper is to explain why, when and how pruning should be done.

1. A tree may be pruned to confine its growth within a certain limited space. 2. To afford better passage of sunlight and air through its crown of foliage. 3. Because the tree is affected with a certain disease on account of which it is full of dead branches and twigs. 4. Through damage from storms or other adverse conditions. 5. On account of age and neglect. 6. Because of transplanting.

Some of the branches should be removed altogether, others shortened two-thirds their length and the rest left undisturbed, that their branches may gracefully hide the pruning. Nearly all trees need pruning from time to time for the proper passage of light and air. This means the removal of surplus and dead wood. My experience is that a healthy vigorous tree, under proper care, should receive such pruning once in four years.

Disease, decay and the ravages of insects will undermine the vitality of a tree in a short time. Pruning, by removing affected wood, will help overcome what would ultimately mean death. The same treatment will prolong the life of old, declining trees. The root system through proper cultivation and fertilizers may be in excellent condition, but the upper structure may not give passage to the sustaining powers from below. Such a tree may be given new life and vigor by a timely heavy pruning.

It is almost impossible to transplant a tree without seriously interfering with its roots. It is unreasonable to expect a tree to sustain its upper structure entire when we reduce its life-giving root system. We often see a tree of considerable size planted with roots cut off to almost fit a post hole and not a single branch left. Then again, we see trees planted of 6-inch caliber with root reduced for a 3-foot hole and the top unreduced. Reason must teach all lovers of trees that there must be a certain harmony and proportion of the root and crown system in order to sustain life during the period of transplanting.

All branches or twigs taken out must be cut close to the wrinkle, leaving no stump whatever. The cut must be clean and smooth, and if of any size, should be covered with paint or other preserving compound to prevent decay. In cutting back branches or twigs, the cut should always be close to a twig or eye from which we expect new growth. Leave as few forks as possible. Pruning is best done during the dormant period, but may be done almost any time without serious damage to the tree. The least desirable time is sapping time.

POTTED PLANTS.

New or dry pots should be soaked in water before potting plants, to fill the pores, otherwise they will absorb all the moisture from the soil and dry out the roots. Potted plants growing in exposed locations or in a room with very dry atmosphere should have pot covers or the pot placed inside another to prevent drying out. Some plants stand dry air better than others, among them, palms, aloes, asparagus, sprengeri and plants having broad leathery leaves.

Plant rooted cuttings in 2 and 2½ inch pots and transplant into larger sizes as the roots fill the pot. If planted in a larger pot the earth will become sodden before the roots fill it and the plant will probably die.

To tell when a plant needs repotting, turn over and gently tap the pot till the edges are loosened and contents may be slipped out. If a compact mass of roots has formed about the earth repotting is advisable.

Slips of geranium, foliage plant and many of the more common house and garden plants root readily in water and scores of those little shoots started now will be of good size and ready for out door blooming by spring. A beautiful conventional bed may be made of foliage plants by using a wagon wheel in which to plant.—Farm Stock and Home.

PINK WATSONIAS.

Mr. F. C. Yeomans of Long Beach recently exhibited in this office specimens of Watsonias which were a rarity and of great beauty. Instead of the usual white—the whitest that grows—these were a most decided pink, with all the other beauty of this most beautiful flower. Mr. Yeomans says that these plants are hybrids from the ordinary Watsonia and another variety. He has produced a large number of bulbs.

Chrysanthemums which have not already been planted should be reset at once. The old clumps may be broken apart and the young sets severely cut at the top. It is rather late for golden rod and golden glow, but both may be re-set with care this month. Shasta daisies would have done a little better if re-set a month ago, but they are so hardy that they may be handled almost any month in the year. Among the annuals, plant seeds of stocks, late cosmos, and in fact, any of the fall annuals, including coreopsis, asters, scarlet flax, phlox and mignonette. A succession of gladiolus may be secured by the putting in of a few bulbs this month.

Small Fruits and Vegetables

THIS MONTH.

THE present warm weather makes it necessary to keep plenty of water at the roots of all plants. Not only must the plants be irrigated reasonably often, but it is advisable to prevent evaporation by dust mulch or good mulch of stable manure, thus keeping the ground cool as well as retaining the moisture.

The planting season is pretty well over, though beans, beets, cabbage plants, corn, melons, potatoes, squash, and tomato plants may still be planted. Of course, where succession of corn, string beans and garden truck is desired, planting may be continued for some time.

This weather will probably fix the cut worms so that we will have but little more trouble with them, but other insects must be fought, and the careful gardener will see that they are subdued. One good way to prevent their spread is by keeping down all weeds and burning all rubbish where they may breed.

BACTERIAL BLIGHT OF THE IRISH POTATO.

Dr. Erwin F. Smith, Bureau of Plant Industry, U. S. Department of Agriculture, has shown that a single species of bacteria, Bacillus solanacearum (Smith), has the power of producing a blight or wilt in a number of plants of the potato family. Among the common ones attacked may be mentioned the Irish potato, tomato, pepper and egg plant. In 1903, Dr. F. L. Stevens and the writer published an account of what appeared to be a bacterial wilt of tobacco in Granville County, North Carolina, to which the name Granville Tobacco Wilt was given. The very recent work of Dr. E. F. Smith confirms this finding and further shows the cause of the disease to be none other than the organism which produces the potato blight. Several common weeds, such as the horse nettle, jimson weed and ground cherry, are also susceptible to the disease.

The blight manifests itself in the vines by a sudden wilting, either of a part or the whole. The stems usually wither, turn yellow and finally black. Young plants appear to contract the disease more readily than old ones. By cutting across the affected stem one can see the characteristic brown or black, woody tissue in which the bacteria are at work. A section across the sick vine just at the surface of the ground, or a little below, will usually show, in addition to the blackened ring, a considerable quantity of a slimy, viscid liquid oozing from the blackened parts, especially if squeezed between the fingers. This is particularly true if the soil is rather moist. Microscopic examination shows this liquid to be swarming with the bacteria, which cause the trouble. It frequently happens in the early stage of the disease that the blackening seen in the cross section of the stem will not appear as a continuous ring, but only as one or two spots. If the vine is slit lengthwise through one of these spots, a blackened streak will usually be found running the whole length of the stem and finally out into the branch or leaf which showed the wilt. The germs appear to live in the soil and gain entrance to the plant through the root or underground stem; and once within the tissue they clog up the water tubes and later on destroy the conducting vessels so that no water can be transported from the soil to the branches and leaves and, as a result, we get the characteristic wilting. The tubers from sick plants show a distinct ring of discolored tissue a short distance from the outside of the potato.

Fungicides are of no value in treating this bacterial disease since the germs are inside of the plant, as well as in the soil, and so far as our present knowledge goes, there is no practical method of sterilizing soil in the field. Prevention is the only remedy. Do not use diseased tubers for planting and avoid planting on potato-sick-land as well as on land which has had diseased tomatoes or egg plants.

This disease must not be confused with the fungus blights, known as early and late blight, which respond quite readily to spraying with Bordeaux mixture. In this case, the organisms which cause the blight grow on the outside of the vines and can be easily reached and destroyed by the spraying mixture.

The symptoms of the blight in the tomato and egg plant are much the same as those for the potato. The vines wilt as if suffering from too hot sun or lack of water. Decay of the stems and branches soon sets in, resulting in the destruction of the plant.

Here, too, spraying has been found useless, for the cause of the disease is deep seated within the tissue and beyond the reach of any germicide. Insects, undoubtedly, play some part in carrying the germs from plant to plant and thus spread the trouble, but the soil seems to be the principal medium of infection. What has been said in connection with the potato may be said about planting tomatoes and egg plants on land that has had diseased specimens of the potato family.

If the disease is not too general, it is possible to control its spread by removing the dead vines with the roots from the field and burning them. It is of utmost importance that the vines be destroyed and not thrown down carelessly to start the disease in a healthy part of the field. Remember that you are dealing with a contagious disease and it is your duty to keep it from spreading. One sick vine in your field this year may mean the loss of half your plants next year. Numerous cases have been reported where soil diseases have been carried from farm to farm, up and down the road by the infected mud that adheres to the wagon wheels. The greatest care should be exercised in plowing and cultivating not to drag sick vines over healthy soil, for by so doing the disease is spread, and what might have been a mild attack is aggravated to such a degree that a general epidemic results. Tools should be thoroughly cleaned before going from an infected field into one free from the disease and, as a further precaution, they should be disinfected by washing or dipping them into a 5 per cent solution of either carbolic acid or copper sulphate, commonly known as blue stone. It is important that the gardener's shoes, as well as those of his horse, be free from clumps of infected soil before going into a new field.

There is a common practice among some farmers of hauling the soil that has washed down a hillside back up onto the shallow places of the farm. If this is done one should be very certain that the hillside from which this soil has washed is free from all plant diseases, for the writer is familiar with several instances where infection has been spread over healthy land in this way.

Where no remedy can be given, it is clear that our only hope of controlling a disease is by preventing its spread. By observing the foregoing suggestions, it is believed that the most serious plant disturbances can be prevented to a great extent, or at least controlled.—Walter G. Sackett, Colorado Agricultural College.

SEED

Melon Seed Morris & Snow's Select Strains of Chilian, Red Seeded, Yellow Bellied and White Seeded. All of extra select stock. Some of our customers have made more money from one acre of these than from four acres of common stock as handled by others.

Casabas also. Improved Hybrid, Summer and Winter, all from select stock. Get our prices and make a trial. We also have a select strain of **Gautier's Pineapple.** All selected from perfect melons and not from leavings, as is customary among many. **Vegetable and Flower Seed** of select strains. Our "High Quality," "Full of Life" Seeds are winning for us wherever tried.

Eucalyptus All the Leading Varieties in seed @ 15c per package, (Six of the leading varieties, E. Rostrata, E. Leucoxylon, E. Rudis, E. Globulus, E. Corynocalyx, and E. Tereticornis for 50c, with cultural directions). 500,000 Plants, all varieties. State your wants and get prices.

HUMUS.

On the recent demonstration train trips several of the speakers dwelt upon the question of the necessity of humus in California soils to the extent that it became a standing joke with the corps of lecturers on the train that the one great essential to human life was humus. "With all your getting, get humus." There was close rivalry between Prof. Loughridge and Prof. Shaw as to which had the greatest claim to this topic. It became so popular a subject that even the ladies accompanying the train could make remarkably intelligent talks upon the requirements and advantages of humus. In the words of Prof. Loughridge:

"Humus was described as having special properties and these properties were given to the soil in which there is an abundance of the humus. Soils with an abundance of humus were shown to be essential in their texture, highly absorptive of moisture and rich in nitrogen. Soils rich in humus also were capable of holding fertilizers better, of taking mineral matters in the soil and rendering them available for plants. Humus in the soils of Southern California is quite deficient and as a consequence such soils crust over on the surface readily and have other properties which are injurious. Humus is destroyed by constant cultivation of the soil, by fires and by bacteria in the soil. It is restored by a proper system of green manure crops. These turned under the soil deeply and allowed to decay produce after a while the humus but the conditions for such change must be carefully attended to, namely an abundance of moisture, absence of much air and presence of lime. The best crops for green manuring are said to be either the Canadian field pea or common vetch, the latter being especially recommended."

DRIED FRUIT.

One of the largest citrus growers of California, while in the Cultivator office recently, remarked that oranges were doing only fairly well. In fact, the market was rather discouraging. Asked as to reasons, he said; "It is due to the quantity of dried fruit in the market." Of course we at once saw possibilities of conflict between the dried fruit and fresh fruit producers, but it gradually dawned over us that the "dried fruit" to which the citrus grower referred was not California's luscious peaches, apricots, raisins, etc., but "dried oranges."

It cannot be denied that there was much fruit injured during the extreme cold weather of the past season. It was rumored that the injured fruit was all rushed out within a few days after the cold snap so as to get rid of it and make way for the sounder fruit that would come later, but, unfortunately, this was not the case, and all during the season the market has been more or less affected by the pithy, punky, dry "rag" which has been offered in place of the luscious fruit which should have gone forward. This has affected the market on the best grade of fruit. There has been shipped much exceedingly fine fruit this year, and at this time there is much yet to go. Every effort should be made to protect the market for this good fruit, and the most assured way to do this is to cull out all the dry, punky oranges, even if they have been shipped under no-name labels, and so keep them from injuring the entire industry.

FLAG DAY.

Next Monday may not be a legal holiday, but it is a day which is being observed more and more each year. On that date, one hundred and thirty-two years ago, the stars and stripes were first flung to the breeze in New York City. In other words, the day has become known as "Flag Day." In an exchange we note that—"The suggestion for the celebration of this day dates from 1889, when George Bolch, a teacher in the free kindergarten schools of New York City, put his suggestion into practice. That day was chosen, since it was on June 14, 1777, that Congress adopted a resolution providing that "the flag of the thirteen United States shall be thirteen stripes of alternate red and white; with a union of thirteen stars of white in a blue field, representing the new constellation."

That date, then, marks the official birth of the stars and stripes. However, The British Register of 1776 says: "The rebels burned the King's speech, and changed their colors from a plain red ground to a flag with thirteen stripes, as a symbol of their union of thirteen colonies."

The flag was first carried in the battle of Brandywine, September 11, 1777. It was first saluted by foreign navel vessels in a French port when displayed by Paul Jones, flying from the Ranger."

FOREST FIRES.

From reports which have already been coming in of field and forest fires which prevail in nearly every section of the state this season, it is apparent we will have our usual, if not a greater, number of fires to contend with this summer. The dry season will be a long one, and unless great care is exercised on the part of all, great disaster will be visited upon every section. Let everyone constitute himself a committee to educate others in the handling of fire in the forests. Nine-tenths of these fires are the result of pure carelessness on the part of those who simply "didn't think." A few embers left from the camp fire may cause a conflagration which will sweep several thousand acres. Any such carelessness should be promptly reported to the proper authorities and the penalty visited on these careless ones who jeopardize the interests of producers.

TROUBLES.

Once upon a time, so the old fable says, the creator, wearied of the continual lamentations of mankind over their grievous burdens, issued edict permitting each one to bring his burdens, cast them down and choose the burdens of anyone else which he thought to be easier than his own. Great was the rejoicing and quickly did each one avail himself of the opportunity, and with much care choose what seemed to him to be a very light burden. Alas for human judgment, in a short time each one found his newly-chosen burden to be more grievous than his old one, and again the creator was besieged with prayers and petitions until at last, through sympathy, he permitted each one to exchange his new burden for his old. Henceforth each one bore his old burden without complaint, for it had ceased to be grievous because all burdens are grievous only by comparison.

Commenting on the above and comparing the troubles of the Porto Rican fruit growers the P. R. Horticultural News says: "We think we have troubles, very serious troubles, but everywhere I went I found the planters fighting with their troubles and meeting many obstacles in their road to success. In Haiti the rotten government kills all progress and almost absolutely precludes any successful industry. In Cuba it is trade restriction, tariffs, and other troubles similar to our grown. In Florida they have the same difficulties with insects and diseases as we have and some other troubles which we have not, such as drouths, poor soils, and frosts."

California growers have troubles, but they are all bearable, and intelligent fighting them down wins both money and the admiration of others.

FUMIGATION REPORT.

The first report of fumigation investigations in California has been published in bulletin form by the U. S. Department of Agriculture and will be mailed in a very short time. It is the report of an extensive series of investigations conducted by Messrs. Woglum and Maskew during the past two years. This will be looked forward to with interest on the part of citrus growers who have already been greatly benefited by the investigations of these two men. The Cultivator has been granted the courtesy of reproducing some of the charts which have been made as a result of these investigations. These publications should be of great value to many fumigators. We assume that copies of the bulletin may be obtained by addressing the Department at Washington.

WHITE FLY.

From present indications it would seem that the white fly have been absolutely eradicated from the Bakersfield and Oroville sections. As to Marysville, we are told there is a possibility of further trouble, but there is most constant and careful watchfulness on the part of the inspectors to keep it under subjection. State Commissioner Jeffrey writes us that the situation at Marysville is now in as good shape as possible, and adds; "We have no fear of the insect getting the upper hand in this state." From other sources, this appears to be generally conceded, and we feel that the state should be deeply grateful for the vigorous and successful campaign which has been carried on.

THE EDUCATION OF THE FARM BOY.

(Continued from Page 659.)

the same protection that is guaranteed to our criminal classes.

Establish standards and create ideals that will hold the rural element. The open country should be the most beautiful spot on earth for we there have soil, water, sunshine and opportunity to combine them. Teach the boys to love nature in its attractive forms. Give him health and strength through right living in the open air. Make him master of his calling and he will respect and dignify his occupation. Each farm of the state should be an object lesson as to what a farm ought to be. How many reach the standard? Practical results are what we seek, so take this question home and ask yourself, what are you doing to make farm life attractive?

Agricultural Notes of the Pacific Coast

Northern California

Sacramento has recently started an ostrich farm.

Tehama county fruit is reported as excellent in quality.

Winters, Yolo county, shipped her first ripe apricots on May 22nd.

Red Bluff, Tehama county, reports extremely heavy crop of apricots.

Table grapes are generally promising and a fine output is expected.

Placerville, El Dorado county, had quite heavy rains during the last of May.

Georgetown, El Dorado county, reports an exceptionally good cherry crop.

Grass Valley, Nevada county, has had 72.21 inches of rain during the season.

Sacramento Bee appeals for more systematic planting of trees along road sides.

Volunteer barley on one Yolo county ranch will yield twenty-five sacks to the acre.

A number of Sonoma hop growers have already made contracts for this year's output.

Sonoma county is appealing for a county fair to be held next September or October.

Hop prices are increasing and the growers generally feel satisfied with the present outlook.

Anderson, Shasta county, reports exceptionally heavy yield of all fruits, especially of prunes.

Willows, Glen county, reports an immense crop of beets which are now being weeded and thinned.

A dispute has sprung up between Lake and Butte counties as to which has the "largest oak in California."

A contract has been let for the construction of six miles of canal to irrigate lands at Los Molinas, Tehama county.

A large new fruit warehouse and packing house has recently been constructed at Placerville, El Dorado county.

Lincoln, Placer county, recently held a big irrigation meeting to encourage more scientific and intensive farming.

The thirty-sixth annual picnic of the Bennett Valley Grange was held at the grange hall and picnic grounds last week.

A boy at San Leandro made a hearty meal from cherries and warm milk and was poisoned so that he died shortly after.

Some Sonoma county farmers are experimenting with a farm automobile much cheaper than the ordinary and equally effective.

Orange growers at Oroville have sued a fruit company for balance of contract price of nine car loads, which the buyer refuses to pay because the growers did not deliver the number of cars which were estimated.

A phemonena in tree growth is shown in Santa Rosa where the roots of an old fig tree which had been covered, after the tree was chopped down, by a building for 25 years, retained their vitality. When the building was razed to the ground recently the roots of the old tree began to send up sprouts.

Central California

Lodi is now in line with suggestion for Unfermented Grape Juice Day.

A $3500 irrigation plant has been installed by one orchardist at Lindsay.

Petition has been filed for the formation of a levee district in Tulare county.

Salmon are running heavily in Monterey Bay and immense catches are reported.

Quite extensive planting of orange trees will be made near Bakersfield this season.

Corn fields at Hanford have been attacked by a large green worm which has done much damage.

Forest Supervisor Shinn has notified the stock men of central California that the forests are not yet open.

Owing to shrinkage in the tonnage of grapes now grown near San Jose, the winery there will remove to San Martin.

The pumping plant of the Copo de Oro Water Company at Porterville, suffered a collapse because given too big a load.

Santa Clara Valley shipments of cherries are said to be about the same as last year's output and at prices that are fairly satisfactory.

Turlock berry growers claim their berries are the very best ever, and that they bring the top of the market in San Francisco and Oakland.

The station at Earlimart, Tulare county, has been moved about three miles to bring it into the more thickly settled part of the community.

A farmers' union local has been organized at Cupertino, Santa Clara Co. F. M. Coleman is president, H. B. Lydiard, secretary and treasurer.

There are twenty-five pumping plants located on the ranches around Delano, and all of them have proved remarkably profitable investments.

San Joaquin county is planning for an irrigation system which it is claimed will cover 62,000 acres of land. It will be under the Wright Irrigation Law.

A monster traction engine at San Jose tried a bridge which was too lightly constructed for its weight and both went to the bottom of the stream.

A Porterville grain grower has some volunteer wild oats which stand in the sheaf seven feet high. The same grower also exhibits alfalfa six feet high.

A serious outbreak of black brood disease has appeared in the apiaries of eastern Tulare county. The department of agriculture has been asked to investigate.

People along the line of the old narrow gauge from San Jose to Santa Cruz were highly elated on the reconstruction of that line and the sending through of the first train last week. This is the first train over the line since April 1906.

Tulare county horticultural commissioners have been so energetic in the enforcement of the horticultural laws that it has been discovered that some nursery trees have been shipped to other points outside the county then hauled by wagon and planted within the county without inspection.

Southern California

Hemet farmers are busy harvesting hay.

Many are engaging in the poultry industry in the Coachella Valley.

Escondido, San Diego county, hay crop is proving of very high-grade.

Coachella claims the record for shipping the first green corn this season.

Large numbers of Arizona cattle are being shipped into Imperial Valley for fattening.

It is now estimated that the crop of cantaloupes in Imperial Valley may not exceed 800 cars.

So far the Imperial Valley cantaloupe growers have shipped melons only in express lots.

County Bee Inspector Pleasants of Orange county reports inspecting a dozen apiaries during May.

The first melons out of Imperial Valley commanded $5.00 apiece. There were only two of them, however.

The big sugar factory at Santa Ana is steaming up and every promise is made for a good run for its first season.

The good old summer time began in Imperial Valley last week when 108 degrees in the shade was reported.

Riverside county officials have been experimenting with a weed burner which is reported to be remarkably satisfactory.

Nothwithstanding the indifferent prices which oranges have commanded this year, many sales of real estate have been made at Riverside.

The Coachella Valley has proven a winner this season with early shipments of summer squash, string beans, tomatoes, egg plant and apricots.

Palo Verde on the banks of the Colorado River, in the extreme northeastern corner of Imperial county, has been partly under water owing to high water of the Colorado.

Lemon growers are still shipping large quantities of lemons, notwithstanding weather conditions are such that sales are most unsatisfactory. As a rule the lemons have been poor keepers this year.

Owing to the absence of late rains and the continued dry weather which will be before us for months, many interested in the preservation of the mountain forests are using all possible precautions to prevent careless starting of fires.

The contest between the stockholders and former directors of the California Development Co., which is the great corporation responsible for the largest irrigation development ever made in California, and the Southern Pacific, seems to be impossible of settlement. The directors maintain the Southern Pacific is not just.

A "Professor" from Southern California has been interviewed by a paper at Ukiah and in the interview it is stated that he has discovered in the southern end of the state "that the ordinary black ant will remove the scale from fruit trees without injuring the trees or leaves in the least. The work is more complete than that accomplished by spraying." Fruit growers are asking, "Where is the ant at?"

The Coast

Hop contracts have been made at Portland, Ore., at 10 cents.

The record price for wool sold in Montana this year was 24 cents.

The annual cherry fair of Salem, Ore., will be held about the middle of July

A collection of logs and Hawaiian woods will be exhibited at the A-Y-P Exposition.

Swine raisers at Pullman, Wash., have been selling hogs at seven and a half cents.

The wool growers association at the Dalles, Ore., held their public wool sale May 21st.

Cantaloupes at Glendale, Arizona, are reported to be an exceptionally fine crop this season.

A company of Japanese have formed a corporation and are planting 5000 acres near Dufer, Ore.

One hunter employed by the forest service at Wallowa, Oregon, recently killed seventeen bears.

Snake River Valley near Lewiston, Idaho, has promise of an immense crop of peaches and cherries.

Hop growers are elated over the probable increase in duty on hops from twelve to twenty cents.

The Inland Empire of eastern Washington has a greater acreage of grain than ever in its history.

This is said to be the most prosperous season for cattle business in Arizona that has ever been experienced.

Four thousand acres on the Nez Perce reserve are to be thrown open for settlement July 1st, and opened for entry July 31st.

Government engineers are investigating the possibility of an irrigation scheme in the Horse Heaven country near Prosser, Wash.

Contrary to custom, only one wool sale has been held in Idaho this year. Practically all of the clip has been sold at private sale.

Ranchers at Beverly, Washington, are installing large pumping plants and securing fine results from irrigation with pump water.

Government officials in the Hawaiian Islands are making strenuous efforts to encourage the preservation of the forests of those islands.

The Portland hop market within one week recently advanced from ten to twelve cents. The poor crop in England is said to be the cause.

The Hawaiian Experiment Station urges cotton growers to import seed only through the experiment station in order to escape possible introduction of cotton boll weevil.

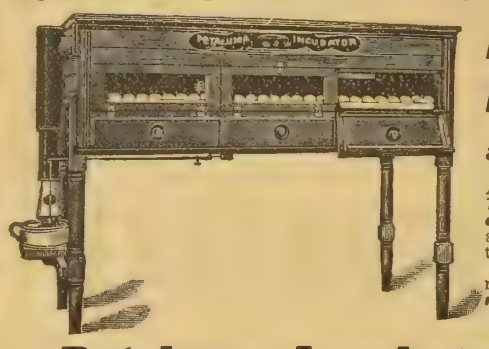
There is some contention between the farmers of Salt River Valley, Arizona, and the citizens of Phoenix, as to use of water from the great Roosevelt dam for creation of electric power.

Many Oregon farmers are greatly disappointed in not being able to collect bounty on coyote scalps. The recent legislature passed a law granting a heavy bounty, and the farmers supposing the scalp only to be sufficient, have been killing the coyotes in vast numbers. It now appears that not only the scalp, but all four feet of the animal, must be delivered up before the bounty will be paid.

Don't Forget Quality

MIDLAND Poultry Food

Is based on ***quality*** and it is quality in Poultry Food that produces eggs. ***Cheap filler*** and ***cheap grain*** will ***not*** make eggs. ***Midland Poultry Food*** contains only the ***choicest*** cereals and animal food the market affords. You ***can't*** afford to try and be successful and not get results. ***Midland Poultry Food*** will produce results. Try it and see. $1.95 per sack



Petaluma Incubators and Brooders

El Centro farmers are discussing the formation of a new co-operative market association.

An expert on rice will be sent by the Department of Agriculture to the Sacramento Valley this season.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

FATTENING POULTRY.

THE fatening-pen should be dry and well ventilated and free from drafts. The birds that are cooped must not be placed in direct drafts or many will take cold. An open shed, with three sides tight, makes a good place for early fall or summer fattening, but for late fall more protection is required to secure the best gains.

Crate Feeding vs. Loose Pen-Feeding.

For a number of years the writer has conducted experiments with chickens in crates and in loose pens. He has tried six different feeders, with varying results. With some feeders, equally good results were secured with birds in crates as in loose pens. In the case of two feeders in particular, the birds could not be fed to advantage in loose pens as compared with crates. With one feeder, on the other hand, slightly better returns were secured in some cases with birds in pens. The majority of buyers of chickens seem to think that the crate-fed birds are much superior to those fed in loose

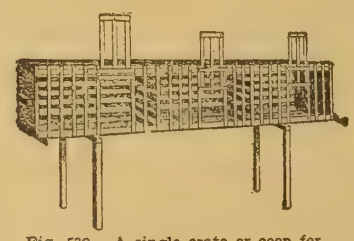

Fig. 539. A single crate or coop for fattening fowls.

pens. The writer prefers to feed birds in crates, for the reason that it takes less room. They are fed with less expenditure of labor, and a more even profit is returned. However, there are many persons who can get good results from feeding birds in box-stalls and like apartments.

Construction of Fattening Crates.

A fattening crate is usually made six feet six inches long, eighteen to twenty inches high, and sixteen inches wide. It is divided into three compartments, each holding four to five birds, according to the size of the chickens. It is made of slats, except the ends and partitions between the compartments, which are of solid wood. The slats on the top, bottom and back run lengthwise of the coop, while those on the front run up and down. They are usually one and one-half inches wide and five-eighths inch thick. Those in front are placed two inches apart to allow the chickens to put their heads through for feeding. The slats on the bottom are placed about three-fourths of an inch apart, so as to permit the droppings to pass through to the ground. Care should be taken not to have the first bottom slat at the back fit closely against the back. An opening at this point prevents the droppings collecting and decomposing. The slats on the top and back are usually two inches apart. There is a small V-shaped trough arranged in front of the coop for feeding and watering the chickens. The trough is two to three inches deep and is generally made of three-fourth-inch lumber.

Very fair coops may be made from old packing-boxes, by taking off the front and bottom, and substituting slats in their places. When fattening chickens inside of a building, it is well to darken the building and keep the birds as quiet as possible.—From Cyclopedia of American Agriculture, L. H. Bailey, Editor-in-Chief. Reproduced by permission of The Macmillan Company, Sew York.

WHY HENS LAY EGGS WITHOUT SHELLS.

There are several reasons for this, and while shell-less eggs are generally attributed to a lack of sufficient shell-forming material being supplied to the hens, in nine cases out of ten improper feeding is at the root of the mischief. This is demonstrated repeatedly by the fact that, even where shell-forming matter is supplied in abundance, hens will still lay shell-less egg. In that case we must look further afield for the cause.

A great deal of mischief is done by feeding on over-stimulating foods and the reckless use of condiments which over excite the ovary, and inflame the lining membranes of the oviduct. In this way the egg-producing organs are stimulated to excessive production with the result that the oviduct becomes diseased and those organs which produce the mineral matter for the shelling of the egg are too debilitated to perform their function properly. It is worthy of note that fowls suffering from inflammation of the oviduct often lose the use of their legs, the trouble being frequently attributed to cramps.

A very common cause of shell-less eggs is internal fat, which blocks the walls of the oviduct and impairs its functions. Worms in the hen's intestines sometimes lead to eggs, being expelled before they are properly shelled. Narrow perches are also responsible for shell-less eggs, the eggs being dropped prematurely, owing to the struggle of the fowls to retain their balance. Similarly, fright will cause a fowl—more especially a pullet—to expel the egg before it is ready.

When a fowl has acquired the habit of laying shell-less eggs there should be a complete change of diet. All soft food, except what is cooked, or juicy vegetables, which may be freely supplied, should be withheld for a time and grain only be given. Enough Epsom salts should be added to the drinking water to make it taste faintly saline, and for a few days the fowl should be housed in a quiet place. To help steer clear of shell-less eggs always supply the fowl with plenty of flint grit and guard against internal fat by feeding moderately—two meals a day are ample—giving a plentiful supply of green stuff. Perches must be of the proper size, and, above all, leave condiments and all that sort of things severely alone.—W. R. Gilbert.

WHICH SHALL IT BE?

The beginner in the poultry business is first confronted by this question.

He discards the mongrels, then he says to himself: "What pure breed of the many shall I procure?" Possi-

bly he can not keep many and only wants one breed.

So now comes the question: "Which is best?"

One neighbor has the small breeds, he has plenty of eggs, but when he sells his fowls they do not weigh much. Then another has a large breed; when he sells his fowls they weigh well but he complains he does not get as many eggs as others. Now, the beginner does not know as yet which to choose.

I would say: First, study your surroundings and decide which breed you can best raise if you have free range and no near neighbors; then choose a small breed or one of the small breeds.

If you must confine them, then choose a large breed. Then which one of the breeds?

I would answer: "The one that suits you best."

As to the financial returns from a large or small breed, we think that at end of the year they will amount to about the same.

The next question is: "Shall I buy a few birds or eggs to make a start?"

This is a debatable question. If the beginner can keep but few chickens he can make a very good start by buying a few good fowls in the fall, and possibly get enough eggs to raise as many as he would wish to keep and some to spare in one summer.

If he wishes to begin on a larger scale, then get an incubator of some reliable make and a hundred or two hundred eggs of some reliable breeder; then by careful management he can raise as many pullets as are wanted for another year.

The inexperienced poultryman or woman will find plenty to do and it must be done. "A stitch in time saves nine." If he expects to buy the chickens, build the houses and then sit down and wait for the money to be handed in for eggs and chickens, he had just as well step down and out.

But attend to every detail at once—feed, house and work, rain or shine, sometimes if necessary in the rain—he will be successful.

The person who does not expect to work and keep moving all the year had better seek other employment than poultry raising.—Poultry Tribune.

ARE POULTRY DISEASES INCREASING?

It is noticeable that, with the extension of commerce between foreign countries and our own, new forms of disease have from time to time been imported, notwithstanding the precautions which are taken to prevent such an occurrence. Our modern methods of transportation by land and sea facilitate the rapid distribution of disease, for no sooner has a disease of an infectious nature broken out than it is conveyed from the place of its origin to the various countries which may be engaged in commerce with that place, and so rapidly does the whole thing occur that in many cases the germs of disease have been widely distributed before the proper authorities can interfere. Not only are diseases more readily distributed now than formerly, but also our modern methods of poultry keeping tend to make our poultry more subject to attack, for every day we are making them more and more of an artificial product. In bygone times, when fowls roosted on trees, or on the tops of houses, or in open sheds, and when comparatively few of them were kept on the average farm, they had a wider range and far more liberty to pick up a great variety of food than they have now, and in these days they were ractically immune from disease. Like wild birds, they were hardy, and could stand extreme exposure without the slightest injury, but, like them also, they were unprofitable, for though their food cost practically nothing, no profit was made.—Reliable Poultry Journal.

Baby Special

Chicks, extra big hatches due every week till late in June. Barred and White Rocks, Rhode Island Reds, White Wyandottes, Black Minorcas, Buff Orpingtons, White and Brown Leghorns. We can supply any of the above kinds in large lots every week.
PRICES—$14 per 100 for all kinds except White Leghorns $10 per 100, and Brown $11 per 100. Cut this ad out and mail with order for 100 chicks of any kind and we will send 10 CHICKS FREE OF THE $14 kind, or 5 free of the $10 or $11 kind. Order at once; we can ship most any day. This offer is good till June 10th. Free chick and hatching egg book, ask for it. We hatch 17 kinds of chicks.

Coulson's POULTRY FOODS
EGG FOOD
At this time of year the hens are apt to begin falling off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting they are likely either to take a long time over the molt or if they molt quickly to have another molt in the late Fall.
A scientificially prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.
Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.
COULSON'S EGG FOOD is therefore what you want to give you RESULTS and keep your flock in healthy condition for the molt.

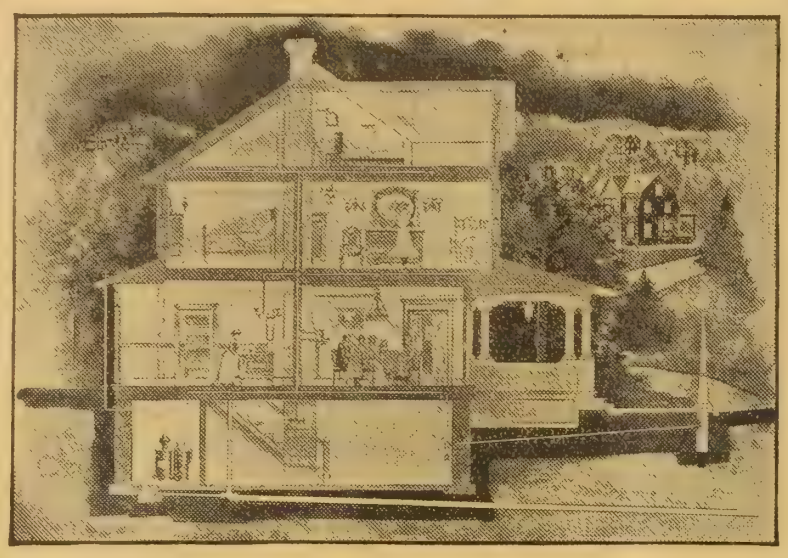
Light and Cook with Colt Acetylene



Here we have a sketch showing a Colt Acetylene light plant in operation. You will note that it is a very simple outfit that can be installed in any house without trouble. The small machine simply sets in one corner of the cellar or shed on a low platform, and is connected with chandeliers in every room, by small pipes running inside the walls, out of sight. That's all there is to it—just the machine, the fixtures and the pipes. Over 150,000 country homes, churches, hotels and stores are lighted by such plants. You can obtain full information concerning Colt Acetylene plants and installations, fixtures, stoves, etc., by addressing

Bees and Their Care

By Henry E. Horn, Riverside

HIVES.

THE main principle in comb-honey production is to have one's hives abundant in bees on the very day the honey campaign begins, and to have all fixtures in readiness. If the honey is to be obtained from clover or basswood blossoms, the apiarist must be in a position to prophesy fairly the day the blossoms will appear. The chief difficulty the comb-honey specialist has to contend with is the desire of the bees to swarm; for if a swarm issues, that generally puts an end to the work on the comb-honey supers. To retrieve themselves, bee-keepers capture the swarm and place the upper chamber of the parent colony on the swarm colony. To compel the bees to begin work actually at once, our best apiarists confine the colony to a small brood-compartment, which has the effect of causing the bees to invade the uper chamber at once; once in there, they will proceed to work on the boxes.

Fig. 319. Divisible brood-chamber, hive and super. The two lower stories for a brood- or breeding chamber, upper one for honey.

A goodly proportion of our apiarists are turning to what is termed the shallow or divisible brood-chamber hives to accomplish this result with the least possible labor. (Fig. 319.) A shallow hive is simply a hive which is shallow in proportion to its length and breadth. Langstroth's hive was ten inches deep, whereas a shallow hive is seven and one-half inches or less in depth, say six inches. The reason for resorting to this kind of hive is that the bees are very loath to enter the small compartments, holding no more than a pound of honey, and compulsion must be used to some extent. To produce extracted or strained honey is easier, as the brooding-chamber and upper story are alike; and as there is plenty of room, there is little desire to swarm. By robbing the hives occasionally, the bee-master deprives them of all signs of high prosperity, and this is sufficient to hold in check the swarming instinct, which is undoubtedly, the bane of successful bee-keeping. Swarming and honey-production are not compatible, and the modern bee-keepers would give a great sum for a method of action which would effectually control it. There are many minds at work on the problem.—From Cyclopedia of American Agriculture, by permission of The Macmillan Company, New York.

CUBAN HONEY AND BEESWAX.

Consul General James L. Rodgers of Habana, in answer to inquiries, furnishes the following information concerning the exportation of honey and beeswax from Cuba:

Although there are large amounts of these products exported, there has been no practical exploitation of the business except on a few places in Oriente Province, owned by Europeans.

During the calendar year of 1906, the last available statistics, the exports of honey amounted to 6,712,[illegible] pounds, of which a little less than [illegible] per cent went to Germany, about 2[illegible] per cent to France, about 15 per cent to the United States and the remainder to various European countries.

The exports of wax, which was principaly produced from honey, during the same calendar year, amounted to 1,383,464 pounds, of which Germany took a little less than 50 per cent, the United States about 25 per cent, France about 20 per cent, the remainder being distributed among various European countries.

The keeping of bees is a general practice in the country districts, and the hiving and all other matters connected therewith are of a most primitive character, the hive being usually a section of a palm trunk, and no particular care is taken to preserve the life of the hive during the taking of honey. Such practice, it should be understood, is not followed, at the modern apiaries, where there is as careful treatment and as modern apparatus as is found in any country.

All varieties of bees, especially the Italian, thrive exceedingly well in Cuba, there being an abundance of the plant life needed for their maintenance.

SPRA-MULSION.

A solution which has proved remarkably successful for scale, plant lice, aphis of all kinds, and other soft bodied insects, has recently been introduced. It is a wash which may be diluted in different proportions with water according to the plant or to the season in which the spraying is done. One advantage it has is that it will mix readily with cold water so that no cooking or other preparation is necessary, more than to stir thoroughly with from 25 to 50 parts of water. It is said to be not only good for the ordinary pests of fruit trees but for lice, gnats, fleas, borers, and mosquitoes, and is recommended for applying to horses and cows to prevent annoyance from insects. The solution is known as Spra-mulsion. It makes a perfect, permanent milk-white emulsion when stirred into water. It is recommended as superior to kerosene emulsion, and to keep indefinitely. It is manufactured by the Rogers Chemical Company of San Francisco.

Irrigation and Forestry

FLOOD OR FURROW IRRIGATION.

THE best arrangement of a tract of land designed for submersion is to divide it into sections, or basins, by means of dikes or ridges, which may be thrown up by the plow. Each section, fed by the ditch, retains its water, the same being allowed to run into it laterally until it stops, and becomes stationary or stagnant. In this way the humidity in the soil is equalized or rendered uniform.

On large level land, or where the subsoil is impervious, the sections or basins may be enlarged. In that case the flow into the basins should be hastened so that every portion of the basin be covered simultaneously, otherwise the humidity would not be uniform. The only limit to the size or extent of these basins is the supply of water and the facilities for flowing it upon the soil. Several openings may be made for the distributing ditch to hasten the process, and the length of time the water is to remain upon the soil is gauged by its permeability. The soil should not be saturated unless a system of drainage is provided. This can only be determined by testing the soil after the water has been run off or is all taken up. If sodden, there is too much, if after a few hours it will not pack in the hands, it is ample. If the quantity of the flow of water justify it, a number of basins may be submerged simultaneously by openings made through the ridges or dikes.

Submersion without dividing the land into basins causes a great loss of water. During the daytime it is possible to regulate the flow of water, and with a plow, furrows may be run in various directions or a hoe is often sufficient to direct the water uniformly over the surface. But at night it is not so easy to control the course of the flow, particularly on large tracts of land. Night irrigation of this kind is practiced, but the crop appears luxuriant in spots, which show the lack of uniformity in the application of water.

As to the size of these basins to be submerged, the lay of the land and the water supply must be the guides. There are irrigated lands with submerged basins from the extent of a small garden patch up to a hundred-acre tract of alfalfa.

In extensive tracts, particularly cereals, beets, etc., flowing and ditch irrigation would be speedier and more economical than submersion, and in many cases more advantageous, particularly in the case of barley, but submersion would be beneficial in the case of peas, the former spreading out its roots near the surface, and the latter thrusting them down deep into the soil. So potatoes will not stand submersion but beets can scarcely be drowned out.

Should the land have a slope or grade impossible to level, care must be taken to provide a lower dike sufficiently high to overcome the height at the top where the water supply enters, for in such case the water at the top of the grade would barely cover the soil, but flow over the top of the lower dike and thus become flowing water and not stagnant or stationary.

Professor Schwerz, in his treatise on practical agriculture, thus refers to the advantages and the disadvantages of submersion:

"By inundating the soil it is easy to shield a field from any unfavorable temperature (heat or cold).

"The preparations for inundation are generally inexpensive. The food elements held in solution by the water have ample time to be deposited upon the soil. Insects injurious to vegetation, and which are not destroyed by ordinary irrigation, are totally destroyed, and the same may be said of noxious weeds in arid soils.

"On the other hand, many serviceable plants are drowned by prolonged inundations; herbs are rendered less hardy to changes of temperature, and hay and forage plants generally are of inferior quality. Inundation is deleterious at the flowering period of plants, though they can be irrigated beneficially in other modes. Finally, to inundate a large field rapidly throughout its entire extent is to consume an enormous amount of irrigation water."

From these considerations, the scientist draws the conclusion that "The choice between inundation and ordinary irrigation must lie in favor of that ordinary irrigation, although in turfy, tough soils, or on one very porous, inundation is more advantageous."—Anderson, Primer of Irrigation.

CALIFORNIA PROGRESSIVE.

CALIFORNIA took another step in its effort to promote the practice of forestry within the state, when Governor Gillett signed the bill providing for the creation of county boards of forestry. This bill authorizes the country supervisors to appoint a Board of Forestry whose secretary shall be a trained forester. Such forester shall have power to enforce the provisions of the Act, and all lawful orders of the Forestry Board, and in addition is vested with the powers of a peace officer to make arrests for violation of the law.

The County Board of Forestry is granted exclusive power to decide upon the variety, character and kind of trees, hedges and shrubs that shall be planted upon county roads, highways, grounds and property, and to determine all questions respecting the pruning, cutting and removal of all trees, hedges and shrubs, and the extent of and manner in which such work shall be done.

A violation of any of the provisions of the Act shall be deemed a misdemeanor. A special fund was also created to be made up of any penalties incurred through a violation of the provisions of the Act, and all moneys thus received shall be available to cover the expenses of the Board.

This law was the direct result of the work accomplished by Riverside County, which has for some time maintained a paid forester to look after the setting out and caring for trees within the county. The results obtained in that county were so satisfactory that it was thought desirable to extend the scope of the work to other localities.

It is odd to reflect that it is possible for one to be in four states at the same time. Yet there is one such spot in the United States. Glancing at a map, one finds an intersection between two straight lines, where Colorado, Utah, New Mexico and Arizona meet. The place is seldom visited as it is not easily reached. The stone erected by government surveyors is on the top of a spur in the Carrizo mountains. The nearest railway town is Mancos, nearly a hundred miles from the four corners. The region about was once densely populated by cliff dwellers, but there are now no human beings within miles. Some years ago the Indians destroyed the boundary shaft and it was not replaced until 1904, probably because a long time elapsed before the authorities knew the old one had been wrecked.—Field and Farm.

The Colorado river is showing its "June flood" much earlier than usual.

Fails To Breed.

My oldest Jersey was four years old this spring. She freshened first at twenty months, and three months later freshened again. Then we thought it best to let her rest a while, and didn't send her away for six months, after which we thought her with calf as she didn't come in heat again for three months. We have kept that up for over a year, have her served and she seems all right for about three months, then comes in heat again. The first two males she was served with have given a great deal of trouble in that respect, many fine heifers being butchered because they failed to get with calf by them, but the third time I sent her to a male which I had never known to fail, but the result was the same. Now I have had her served the fourth time, with what results I cannot say, as it is yet too soon. Do you think she aborts? I take care of her personally and have never seen any signs of it.

Which way would I raise the most feed on a small patch of ground, by planting to alfalfa or putting it into oats in fall and corn in spring?—Mrs. I. W., Long Beach.

A good breeding powder might prove beneficial. On the ranch we do not have this trouble. I believe it is because the sires are well fed and not over used. In the town the trouble prevails. I had a sire that last spring was used on eighteen cows and produced a calf to every cow. I sold him to a man to use in a stable and showed him that the sire was right. Now I am waiting with interest to see what the report will be of the use of this animal in the village.

Oats, peas, corn and beans will give greater tonnage of green feed on a small plat than alfalfa. Manure must be returned to the land and more labor put on the cultivation. Adding peas will give earlier feed than oats alone. Planting half sorghum and half corn will increase the later yield of feed. The sorghum can be cut to the first joint three or four times, and come again and again. If the winter is a mild one, this plant becomes perennial.—M. E. S.

Soiling Crops.

I am told that you have raised many field peas on your place, and have received good results from feeding them to cattle. Would you kindly advise me if these field peas are of the Mexican field variety which are fed out in Colorado to the lambs and hogs? What time of the year do you plant these, and what is your method of harvesting? Have you fed any of these field peas to sheep in your section?—J. H. W., San Francisco.

We have raised the common garden pea sown with oats for both silage and hay. On this feed both cows and colts do well. On the same land we grow a summer crop of corn. The Canadian field we have sown as a green cover crop in the orchard and turned it all under except a little used for making seed for next year. These peas go under when in blossom. The straw from the plants that make seed is eaten clean by the young heifers. We cut peas with the mower and have them forked into stacks by hand as the rake breaks them too much. The stacks or cocks are put up as fast as cut and weigh about three hundred pounds after they are cured. Three days cures them down here in the dry air. All these peas must be inoculated to make satisfactory growth. We use soil from the pea rows in the vegetable garden, dampen the peas, roll them in it, sow at once and cover before they dry out. The Cow peas are beans and are used for summer sowing. We prefer them in rows to cultivate and irrigate during the season. The common garden peas, the Tangier peas, and the Canadian field peas may be broadcast and sown in the fall, or may be drilled in the corn field after the corn is siloed and left for the first rains to start into growth. They are cut when in bloom and cured for hay the same as other crops. If you can manage to hit it just right putting in the peas and sowing broadcast, any grain with it makes good feed. We have a few times come out right by broadcasting peas ahead of the gang plow, then after the plowing harrowing the ground carefully. Sheep, we know nothing about here, except as a means of cleaning up the land after the vintage and then it is grapes they feed upon. Mexican field peas I do not know, and yet if they are like most southern peas, would hardly think they would do for winter sowing.—M. E. S.

Sore On Udder.

I have a very fine cow, six years old, fresh two weeks, had no trouble with bag caking. The third or fourth time I milked her, something came down in her front teat like a small pea and stopped the flow, then went up and comes back now and then. A few days ago the milk smelled badly. I looked the udder over carefully and found a scab near the top in front and between the two milk veins. I pulled it off and found a very angry looking sore there, There seems to be a core running back over top of the udder about the size of a fifty-cent piece. Cow was in pasture until she came in. Now I feed four quarts bran night and morning, with a little salt and handful of oil cake meal with each feed, and all the oat hay she wants. She is in good flesh but has gone off about one-half in milk. We don't use the milk, but feed some to calf. Will it hurt calf for veal?—M. D. M., Watsonville.

If this is a sore, not an abscess, I should simply coat it with powdered willow charcoal to dry it up. If it is a deep-seated affair throwing off pus, it should be washed out with a teaspoonful of peroxide of hydrogen a few times and then dusted with the charcoal. If this is a surface sore, dusting it daily with powdered charcoal will soon cause it to dry up and heal completely. If it is more deeply seated and the supposed core is not merely a swelling coming from it, I should see that it was well opened up, and then every day for four or five days inject peroxide of hydrogen one teaspoonful to a quart of warm water. If she is a valuable animal I would watch her carefully to see if the udder is really involved in this trouble. The small bit of curd that dropped into the teat duct for the time may have been caused by the heat of fever from the sore. This trouble, like similar troubles in ourselves, will pass away in time. I hardly think that the milk will affect the calf. If it does, by bringing it to a scalding temperature, the trouble will probably be entirely remedied.—M. E. S.

HYDRAULIC PRESS MFG. CO., 122 Lincoln Ave., Mt. Gilead, Ohio

White Guineas.

I note your inquiry in regard to guineas. White guineas are scarce this year and the eggs not very fertile. It is also late in the season. It is possible that I might let your inquirer have a dozen eggs later should the hens commence laying. Just now none of them are laying. I make no guaranty of the fertility of guinea eggs, all are, however, dated. I have only three guineas hatched and about twenty eggs hatching. Guineas are much harder to raise than pheasants. Out of a hundred young pheasants I raised, none have died. It would be far better for your correspondent to buy young guinea stock later. If he buys twelve eggs, the chances are he will not raise a single one.—Capt. C. Nielsen, Sebastopol.

Peach Leaf Curl.

Please tell me what is the trouble with leaves I am sending?—Subscriber.

There were two kinds of leaves in the package sent, both in such condition that it was almost impossible to tell what the trouble was, excepting that the peach leaves were undoubtedly affected with a bad case of peach curl. The one remedy for it is winter spraying with Bordeaux. It is now too late to spray to any advantage.

Garlic.

Spring planting of garlic I have never found successful. December is the best time to plant the cloves like onion sets. In the summer when the tops are entirely dry, the garlic may be pulled or dug up and hung out doors in the sun for several weeks to insure keeping. Garlic brings a good price in the late spring if it has been carefully dried and kept.—Subscriber, Gaviota.

Guavas.

May the lower branches of guavas that hang to the ground be cut off? What is the best time for planting? What soil suits guavas best, and how much irrigation produces most and best fruit?—Subscriber, Gaviota.

The Strawberry guava has a tendency to overbear and is benefited by thinning out and shortening the branches. It is well to keep the bush within such bounds that the fruit may be easily reached when picking. Any branch may be cut off without detriment. Should the entire plant, in fact, be cut off close to the ground, a new growth would soon appear as vigorous as ever. As nearly all the strawberry guavas are seedlings, there is a natural variation in size and quality which cannot be entirely overcome. I do not know of any ordinary soil in which it will not grow and bear well, and as a general rule there is very little danger of over irrigation, but rather the contrary.—C. P. Taft.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Broken Bone.

I have a young heifer that threw herself, falling on her doubled up leg. The hock joint is badly swollen and the joint above the hoof is swollen and tender. She is losing flesh. I bathe the leg with hot applications and rub in liniment.

A neighbor's cow had the skin cut over the hip bone. The hide is off and foul smelling matter runs. The wound is washed with warm water and peroxide of hydrogen, and burnt alum applied.—Subscriber, Watsonville.

Either the bone in the leg is broken or the ligaments holding the joint together are torn loose. Recovery will be slow and very little can be done to aid it.

In the second case, I think a piece of bone is knocked loose from the point of the hip bone. Cut open the hole from which the foul smelling pus comes, giving it a free outlet, and hunt for a loose piece of bone. Wash with plenty of water from a hose, using considerable force. Follow with peroxide of hydrogen or carbolic acid solution.—R. T. W.

Give More Exercise.

I have a fine driving mare. Have been feeding her wheat and oat hay, some alfalfa, very little rolled barley with bran and some shorts, stock food twice daily, and some green barley. For two months she has had a cough with slight discharge from eyes and nose. Have given her "Carolina Pine Tar." Many lumps appear on her, especially after driving, a few have formed scabs. She is losing flesh though eating well. Urine is milky at times. Bites herself a good deal.—Subscriber, El Monte.

I presume your mare is hog-fat, gets about twice as much feed and half as much work as she should have. My advice is to give her no hay excepting thoroughly cured alfalfa, a little grain night and morning, and not less than fifteen miles driving every day.—R. T. W.

Diseased Eyes.

I have two cows that are going blind. Water drips from their eyes and they hold them shut. The balls turn blue and later white.—L. O. J., Silsbee.

Your cows have a conjunctivitis and probably other complications. As you have made no statement in regard to surroundings, I have no idea of the cause. My recommendation would be that you procure the following and inject a few drops three times a day with a medicine dropper. Adrenolin, 2 drams; water, 2 ounces.—R. T. W.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.
Veterinary Hospital, 714 East Seventh St. Los Angeles, Cal.

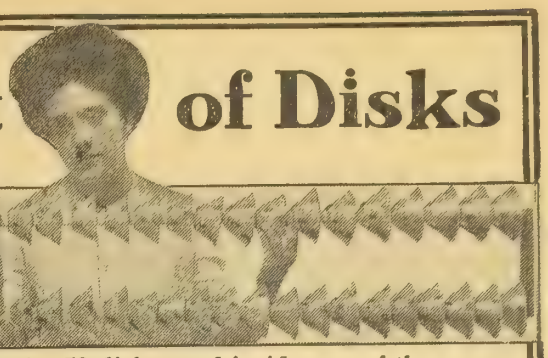
10 Feet of Disks



THIS picture shows the 52 disks used inside one of the many "bucket bowl" cream separators that farmers and their wives are everywhere discarding for the simple, sanitary Sharples Dairy Tubular. We have slipped the 52 disks onto two 5 foot sticks so you can count them. The manufacturer and his agents call this disk bowl simple. Looks simple, doesn't it? They also say the 52 disks can be washed all together—as one piece—and hung up to dry. What do you think of such a statement? Ten feet of disks to wash clean and dry thoroughly, on both sides, twice daily. What a weary job after a hard day's work or a late milking. The maker of this "bucket bowl" machine has brought infringement suits against several concerns who have made and sold cheap cream separators with disks like his for a number of years. Disk machine sales have so decreased that he needs all the business he can get.

Why make the mistake of getting a "bucket bowl" machine? You'll very quickly wish you had a simple, sanitary, Sharples Dairy Tubular Cream separator instead. The dairy Tubular bowl contains just one instantly removable piece about like a napkin ring in size and shape. The entire Dairy Tubular bowl is easily washed clean in 3 minutes. 1909 sales exceed most, if not all, "bucket bowls" combined. Write for catalog No. 260.

ATLAS E-Z SEAL JAR

When preserving time comes round and the "jar question" comes *up*, you will decide wisely if you choose jars of the "Atlas" brand they are far superior to all others. The Atlas E-Z Seal Jar shown below is an *instant* and *perfect* sealer. It has a *wide mouth*, that permits the preserving of whole fruits. It is extra strong at the top and *not* easily broken. It is made by machinery and therefore of uniform thickness and perfectly smooth finish. The most convenient jars to *fill*, *empty* and *clean* are "Atlas" brand jars.

ATLAS SPECIAL MASON

is another extra good jar. It possesses every advantage of the E-Z Seal — strength, wide mouth convenience and smooth finish, but closes with a screw cap. Made specially for those who prefer this kind.

A Book of Preserving Recipes

Sent free to every woman who sends us the name of her grocer, stating whether or not he sells Atlas jars.

If your dealer cannot supply these jars, send $3, and we will express prepaid thirty (30) quart size ATLAS E-Z SEAL JARS to any town having an office of the Adams or U. S. Express Co., within the States of Pennsylvania, New Jersey, New York, Delaware, Maryland, Virginia, West Virginia, Ohio, Illinois, Indiana or Michigan, or we will quote delivery prices in other portions of the United States by freight or express.

HAZEL-ATLAS GLASS CO., Wheeling, W. Va.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT**, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

THE LOOM OF LIFE.

All day, all night, I can hear the jar
Of the loom of life, and near and far
It thrills with its deep and muffled sound
As the tireless wheels go always round.
Busily, ceaselessly goes the loom
In the light of day and the midnight's gloom;
The Wheels are turning early and late,
And the woof is wound in the warp of fate.
Click! Clack! There's a thread of love wove in!
Click! Clack! And another of wrong and sin!

What a checkered thing this life will be,
When we see it unrolled in eternity!
Time, with a face like a mystery,
And hands as busy as hands can be,
Sits at the loom with its warp outspread
To catch in its meshes each glancing thread.
When shall this wonderful web be done?
In a thousand years, perhaps, or one,
Or tomorrow, Who knoweth? Not you nor I,
But the Wheels turn on, and the shuttles fly.

Oh, sad eyed weaver, the years are slow,
But each one is nearer the end, I known.
And some day the last thread shall be wove in.
God grant it be love instead of sin.
Are we spinners of woof for this life-web, say?
De we furnish the weavers a thread each day?
It were better, then, O my friend, to spin,
A beautiful thread, than a thread of sin.

—Anon.

BARBARA'S ENTERPRISE.

"FATHER, Austin Pierce has just returned from a trip and tells me he is positive our land can be used to make brick," exclaimed Barbara excitedly, "and at last we may be able to make the farm pay."

Mr. Meadows had sold his interests in the East and moved with his wife and daughter to the Middle West, with hopes of restoring his wife's health. Here he had been induced to buy a hundred acres of what to his inexperienced eyes, appeared to be good farming land. It proved to be unfit for farming purposes, however, and although the change had been beneficial to Mrs. Meadows in the beginning, hard work and worry soon broke her down, and three years after they moved west, she died leaving a bright, clear-headed girl of twenty to take up her struggle.

His wife's death made Mr. Meadows more discouraged than ever and preyed upon his mind to such an extent that he became a broken-down, childish man, dependent upon his daughter.

Barbara realized her responsibilities and immediately set to work to devise some plan for making money. She found this a hard task for although she had ideas they all had to be abandoned because of the lack of funds with which to carry them out.

Why not take boarders for the summer? This seemed to her the most feasible plan she had yet thought of. She knew that many people spent their summer with other families in the vicinity, and she was convinced that she could succeed.

With the beginning of warm days came the usual summer crowd and Barbara found boarders plenty, for, as one young college man remarked to another, "Miss Barbara is so neat and charming, and so good natured; I know she won't scold and be unpleasant, as Mrs. Johnson was last year, if we should happen to come in late for lunch."

These young men were students at a university and as both had engineering majors, they spent a great part of their vacation in surveying and studying the formation of the country about them, and it was while on one of these trips that Austin Pierce made his startling discovery.

Barbara was too busy to make any investigation into the brick theory just then, but gradually it was noised about the vicinity that "One of them young college fellers boardin' with Miss Barbary, sez he's sartin old man Meadow's land kin be turned inter brick." In some way the news was carried to the nearest city, twenty-five miles distant, and it was not long before she was obliged to give it thought, for she was besieged with speculators and real estate agents, some even going so far as to make offers on the ranch.

But Barbara was suspicious of these men because she felt that, being a woman, and a young woman at that, they would try to swindle her out of the land, and although she had received several offers which seemed quite a sum to her, still she resolved to get the most out of it that she possibly could, and decided to get advice before she took any definite steps.

So early the next Monday morning she went to the city, where she immediately sought out the office of Edward Towne, a lawyer who had settled Mrs. Meadow's estate. To him she told every detail, and before long he was completely won by her earnestness and show of business ability, and he resolved to help her in every possible way. Together they went to a brick specialist who promised to go to the Meadows' farm in a few days and make an analysis of the soil.

When Barbara reached home late that afternoon, she found Mr. Granger, a real estate agent, waiting for her. Mr. Granger had come to the ranch that morning shortly after Barbara had left and had made a thorough inspection of the place. Finding that it was excellent for brick, he had immediately used his large vocabulary of persuasive words in trying to influence Mr. Meadows to accept three hundred dollars an acre.

Poor, incompetent Mr. Meadows was entirely carried away by Mr. Granger's fluent talk, and by the time Barbara reached home the papers had been drawn up and now all that was needed to close the transaction was Barbara's signature.

Fortunately, Mr. Meadows had placed half of the farm in his wife's name when he purchased it, and upon her death her share had gone to Barbara, and consequently both her father's and her signature were necessary.

Barbara was too shrewd not to see in Mr. Granger's smooth words and too polite manner, that the purchasing of the farm would mean a great gain to him, and his haste in trying to close the deal only added to her suspicions. To Mr. Granger she simply said, "As this is a very important and serious matter with me, I must have time in which to think it over, and I will give you my decision one week from today."

Coax as he would, he was unable to move Barbara, and he left in an ungracious mood, showing only too plainly his disappointment, and realizing, too, that this young woman was one who could not be easily fooled.

In a few days, Mr. Moulton, the brick specialist, in making his report of the analysis, said:

"I find that your land is of a clay formation suitable for the making of brick, and as brick is scarce in these parts you should realize at least six hundred dollars an acre; but if that were my land, I wouldn't sell it at any price. My advice to you, Miss Meadows, is to keep the place and start a plant of your own. Well equipped and managed, this should bring you a fortune.

To Barbara this seemed impossible, for she knew it would take money and experience and for the next few days she was in a most wrought up frame of mind. But Mr. Towne came to her assistance, for he realized that there were great possibilities in the scheme and offered to finance her if he could be allowed to purchase one third interest in the plant. Barbara considered this plan in every light and finally consented, for by this scheme she could be able to carry out her ideas and still not be so greatly indebted to Mr. Towne.

When Mr. Granger returned for his answer, Barbara's most emphatic "No," gave him to understand that the matter was not to be pressed and she refused absolutely to divulge any of her plans.

The next few weeks were busy ones for Barbara. Mr. Towne had several cases to attend to and was unable to do any more than give her instructions as to how to start the work, so that the business transactions were mainly in her hands.

Her first step was to decide upon the best location for the buildings, and in this she was aided by Mr. Moulton. When this point was settled he further assisted her by taking her to builders and machinists. Finally with Mr. Towne's approval, she let the contract for the plant. Construction was carried on rapidly, and eleven months afterward everything was in working order.

Austin Pierce having graduated from college and now working for a railroad company, found himself in the vicinity of Barbara's home with an intense longing to go for a quiet week to the place where he had spent such an enjoyable summer three years before.

Imagine his surprise when he found that instead of the old run down farm, there was now a flourishing brick plant, managed by Barbara herself and operating under the name of "The Meadows-Towne Brick Manufacturing Company."

Barbara was too busy to take boarders this summer, but she consented to take Austin for a week because she felt that she owed a great part of her good fortune to him.

That week went all too quickly for both of them, but their friendship was not dropped with the ending of his visit, for, as the old postmaster said to some loungers, "Miss Barbary has sure got a beau in the city, 'cause she gets a letter reg'lar every Wednesday."

A year later the firm's name was changed to "The Pierce-Towne Brick Manufacturing Company," which proved that the old postmaster's words were true.—I. E. A., Campbell, Cal.

About the House

THIS is the "season for refrigerators" and perhaps some general rules for "running" a refrigerator may help some of the younger housekeepers.

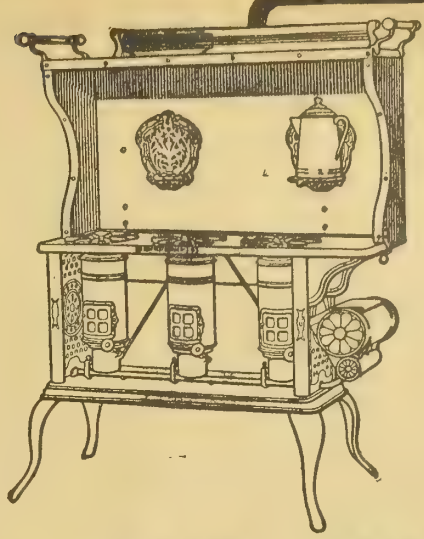
First, the refrigerator must be kept sweet and clean in every part—ice-box, waste pipe and provision chamber. Then the ice box must be well filled with ice. Ice will not melt so fast if the box is kept full.

Be sure to see too, that the lid of the ice box and the doors of the provision chamber are kept tightly closed, for the warm air rushing in will melt the ice and the food will spoil.

A porch where the wind and sun can reach it is not a good place for a refrigerator, and the cellar is too damp. The kitchen or pantry is a better place. The kitchen stove will not be as harmful as the wind, sun or dampness.

If by any chance the ice in the ice box should give out, open up the refrigerator and let the air in or the food will mould and spoil, and in the fall when you quit using ice, be careful to air and dry the refrigerator thoroughly or you may have a musty refrigerator ever after. It makes a difference where the various foods are placed. Butter, milk or drinking water in open vessels should never be placed in the ice chamber, for they will absorb the odors that come from the food stored below. Just under the large opening where the cold air descends from the ice chamber is the place in a refrigerator that is almost entirely free from odors. This is the best place for milk and butter. Milk in covered bottles can be placed in the bottom of the provision chamber, as that is the coolest place. This is the best place for fresh meats. Fish, cleaned ready for cooking, may be wrapped in a clean cloth and placed here. Bottled water or other bottled beverages, and such vegetables as lettuce, cucumbers, celery, radishes, etc., may be laid in the ice chamber.

A can of fresh oysters should not be put on top of the ice, for cold air never goes up and the oysters in the upper part of the can might spoil. Lay the can in a basin or pail, cover with water and lay a piece or two of ice on top of the can and place in any part of the refrigerator. Or lay the can in the ice chamber under a piece of ice.—Elbepe.



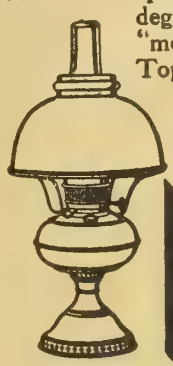
The Oil Stove With a CABINET TOP

The New Perfection Wick Blue Flame Oil Cook-Stove differs from all other oil stoves.—*It has a CABINET TOP.* This means you can keep dishes and utensils within easy reach while cooking, *and can keep food hot after removing it from the blaze.*

From its wonderful burners to its racks for holding towels the

NEW PERFECTION
Wick Blue Flame Oil Cook-Stove

is without equal. Its principle of concentrated heat means that the work can be done quickly and without the kitchen being heated to an unbearable degree. Can be lighted instantly and turned "high," "low" or "medium" at will. Three sizes. With or without Cabinet Top. At your dealer's, or write our nearest agency.



The **Rayo Lamp** comes as near lamp perfection as it's possible to get. Gives a clear, bright light that reaches the farthest corner of a good-sized living-room. Well made throughout of nickeled brass; perfectly safe and very ornamental. If not with your dealer, write our nearest agency.

Figs 1.75

CANTALOUPES.

Cantaloupes are doing well. Specials are commanding $1.50 to $2.25 and Ponies go as high at $5.00. Express shipments only are received. Car shipments will probably commence soon. Report from Imperial indicate much preparation on the part of the transportation company to give best facilities to handle the 800 or 1000 cars which will be produced there. The acreage is about one-third that of last year, so fair to good prices are anticipated during the season. Quality of melons so far received is excellent.

Cantaloupes .....1.50@5.00

Hay.

Scott & Magner say: The majority of the hay that has been coming in lately has been of the new crop. There has not been much of the old crop offered, and very shortly this small supply will cease. Our new crop being in such good condition, it has been going into consumption satisfactorily and extensively.

The majority of the offerings here has consisted of volunteer crop, which is selling on the cars in San Francisco at from $11.50 to $15.00. In some cases a little better figure has been realized for something that was exceptionally choice, or on days when arrivals were particularly moderate.

New wheat and wheat and oat hay is just beginning to put in its appearance on the market here, and no definite trading basis can be figured on until later on when conditions throughout are better understood by both buyers and sellers.

Alfalfa hay has been in light supply and the demand is also moderate. The market is a little weak and no activity shown at any point.

Deciduous Market

Sacramento, Cal., June 5, 1909.

The cherry market has remained very steady since our last report as is evidenced by the markets yesterday, which we quote as follows:

Minneapolis:—Royal Annes 80c to $1.45, Black Oregons, $1.75 to $1.90, Centennial $1.30 to $1.40, Tartarians $1.55 to $1.90.

Chicago:—Royal Annes 80c to 3.35, Tartarians $85 to 1.85.

New York:—Tartarians $1.10 to $2.25, Royal Annes $1.25 to $2.20, Rockports $1.20 to $1.75.

Billing price on express shipments is $1.25 f.o.b. for all varieties.

The first mixed cars, which were shipped from Vacaville and Winters districts, are now en route to the East. These contain about an equal assortment of apricots (Royal, Seedling and Newcastle varieties), Alexander peaches, Clyman Plums and Royal Anne, Bing and Black Oregon Cherries.

The first mixed car from Placer County was shipped yesterday, being billed from Loomis. The same contained 400 Alexander Peaches and the balance apricots, Clyman Plums and a few cherries. Very good prices are expected for these first cars, the first of which will sell the middle of next week. Shipments will increase daily as other varieties of peaches and plums come in. The next varieties of plums will be the Tragedy, Burbank, Abundance and Climax. There have been a few Tragedys shipped already. The Alexander Peaches will be followed by Triumph and Hales.

The weather has been very warm the last three or four days and this has caused the fruit to ripen very quickly, and by next week we should have a plentiful supply of all the early varieties, which will enable the shipping firms to fill their orders for Western markets.—T. C. Tucker.

Citrus Market

LOS ANGELES, June 9, 1909.

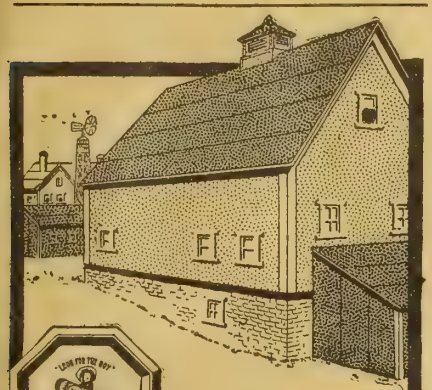
The present market conditions on oranges are such as to gladden the heart of the grower of Valencias. In fact, the navels yet to be marketed are commanding 35 to 40 cents in advance of prices secured a couple of weeks ago, but as the navels are practically all shipped, this will not be such good news to the navel men as to growers of the late fruit. The output of Valencias will probably be very large. The estimate is that it will be at least twice that of last year, but if no stampede is made toward shipping all in a bunch and the shipments are properly distributed from now until November 1st, it should all command a good price.

Lemons are brightening up materially and recent shipments will probably command a good price. The weather in the east is more favorable for lemon sales, and the season is ap-

proaching when even the lower grade fruit should be unloaded at a fair price.

Shipments.

Total shipments of oranges and lemons to date since November 1st, 27,962 cars, of which 24,372 were oranges and 3,590 lemons.



The Roof That Is a Roof

A roof that gives only half the service that a roof should is only half a roof. REX Roofing makes *the roof that is a roof.* REX gives full service and full protection. It keeps out wet and dampness, it protects stock from extremes of temperature, wind cannot penetrate it or blow it off. Falling sparks or firebrands do not ignite it. It will not rot, melt, crack, peel, blister or curl, and withal

REX FLINTKOTE ROOFING

has the greatest durability—because it is made *honest all through.* Its quality is in its body as well as in the surface coating—it is made of dense long-fibred felt. Any farm-hand can lay REX Roofing—everything needed but the hammer comes in the roll.

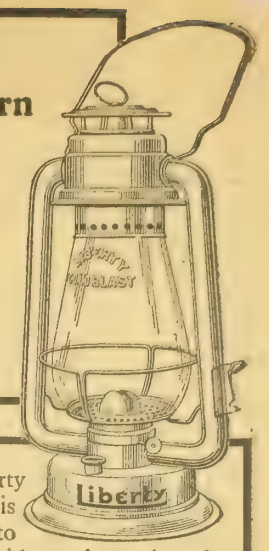
ON TIME.

As usual the Petaluma Incubator Co. is on time. This time it is at Seattle. Gen. Manager Gray of the company, writes us: "A message from our president, Mr. L. C. Byce, who is in attendance at the Alaska-Yukon-Pacific Exposition, at Seattle, Wash., superintending the installation of our exhibit of "Petaluma" Incubators and Brooders in the California Building, states that the Petaluma Incubator Co.'s exhibit is one of the few all ready for opening day, June 1st. Many exhibits are backward, some just commencing, others just arriving. Those that are actually ready for the opening day are in the minority.

"The Petaluma Incubator Co.'s exhibit is attracting great attention from the start, great interest being taken in the full line of "Petaluma" Incubators and Brooders, Baby Incubator, or Infant Nursery, Bacteriological and Ostrich Incubators, and the large Electric Advertising Cabinet."

This Lantern is All Light and All Right



The Liberty Lantern is designed to avoid trouble, and to give the biggest, brightest, whitest light.

Liberty Lanterns

cannot get out of order. Each burner has a special device that prevents the wick from jarring or jolting down. Wind proof. Storm proof. Easy to fill. Burn *all* the oil. Never leak. Bail stays in any position. Globe tough—clear as crystal. Prices range from 60c to $3.50.

If not at your dealer's, write us.

Information That Is Worth
DOLLARS
To You

Isn't it worth money to know that with our patented vaporizer (found only on the Western) you will get from 25 to 30 per cent more power out of a gallon of low grade distillate than other engines get from a gallon of high grade gasoline? Five minutes' work with a scratch pad will show you what effect this will have on your fuel bills.

Ask us about the Nix-Frost Crude Oil Gas Producer, the cheapest power on earth using Crude Petroleum as fuel.

Latest Deep Well

Turbine Pump

Guaranteed to deliver from 100 gallons per minute upwards, depending on the diameter and capacity of well, from a depth of 50 to 300 feet below the surface. Can be either belt driven or direct connected to electric motor as occasion requires.

Write for Catalogue 46B.

A deep well pump that has no valves or plungers to wear or get out of order, no gears, consequently no noise or breaking of teeth.

Compact, durable, always primed and ready to operate, constant flow, hence increased capacity of well.

This type of pump is fast taking the place of Vertical Steam. Deep well Plunger and Propeller Pumps.

As They Harvest Grain at Sanger

Familiar Scenes in Fresno County These Busy Days

Future Citizens of Kerman, California

J. W. Brooks, J. B. Deardorff, J. W. Lamb, J. W. Cook, E. M. D. Smith, C. E. Wells, C. F. Anderson and L. W. Brooks, all of Towner Co., N. D. Together they bought 220 acres of land March 18, and will help to make Kerman the richest colony in California.

Do You Know

That the east is burning up with land hunger? That productive lands are getting scarce and hence higher? Do you know that the people east are just beginning to find out that there are agricultural lands in California and hence that we are on the eve of the greatest emigration movement California has ever experienced.

Do You Know

That as a consequence it behooves all who are landless in California but who hope sometime to enjoy the blessings of a landed home, to get busy and to secure the home before the other fellow gets it, and before prices have advanced to where they are prohibitive? That the easterners who are coming here now are astounded with the agricultural possibilities of "New California?" That they are buying themselves, and then going back home spreading the news of their find, and inducing others to come?

Do You Know

That ere long the man who owns productive land here will discover its value, and will refuse to part with it at several times the amount it now takes to "lift" it, and that when that time comes it will be everlastingly too late for many.

Do You Know

That the value of land depends upon what it will produce per acre? That land on the **Kerman Tract** is today the cheapest land in the United States, value of possible products considered? That this fact is becoming known, and that it is bringing more people here than have ever come to any other similar tract in the same length of time?

Do You Know

That the **Kerman Tract** excels when it comes to water right, quality and lay of soil, natural drainage, location, and in possibilities for fruit and alfalfa growing, dairying and poultry raising? That it is unsurpassed, if equalled, in the things that go to both home and money making? That it is being populated by the very best quality of people, the cream of the country? That undesirable people are not allowed to buy land here and that those who locate are protected against the scourge which has ruined so many otherwise promising colonies in California? If you do not know these things now

We Are Telling You

And we ask the privilege of further informing you. If you are interested we would like nothing better than the chance to satisfy you upon all these points, either by correspondence or by showing you over the tract. We consider it a pleasure to show interested visitors over the colony, and all comers are accorded courteous and considerate treatment. Our circular explains in detail what is here, and it is free for the asking. Write for it, and do it now. But, what is better, come here and satisfy yourself that the **Kerman Tract** is as represented, and that you are not missing something that cannot be retrieved by not taking advantage of this opportunity now. Either write to

Forestry in Other Countries

Practical Ideas on Forestry Gathered from Other Countries by Gifford Pinchot, Forester of the U. S. Department of Agriculture

EXCEPT China all civilized nations care for the forest. Until recently the United States ranked nearly with China in this respect, and our country still remains far behind the progressive modern nations in nearly all that relates to the protection, preservation, and conservative use of the forest. Japan has a well-developed forest service and a national forest school. In Austria, Italy, Norway and Sweden government forestry is a well-established portion of the national life. Turkey, Greece, Spain, and Portugal give attention to the forests. Russia, dealing like ourselves with vast areas of forests in thinly peopled regions, but by methods wholly different from our own, is drawing enormous revenues from the systematic care and use of the forests. In Germany the scientific treatment of forests has reached, perhaps, its highest development. The foresters of France have perfected a most practical and effective general system of forestry and have created the difficult art of controlling the floods of mountain torrents by planting trees. The Republic of Switzerland, by the use of methods most instructive to citizens of the United States, has developed a type of government forest policy more worthy of our attention and imitation than any other in Europe. In Australia and New Zealand forestry has already made important advances. In Canada the English have made real progress in forestry. The Government sells the timber from its forests, but retains possession of the lands and employs fire guards. At the Cape of Good Hope they have an excellent forest service. In British India they have met and answered many questions which still confront the American forester, and in a little more than thirty years have created a forest service of great merit and high achievement. The United States has scarcely yet begun.

The Forest In Early Times.

In very early times the forest was preserved for the game it contained. Forestry then meant the art of hunting, and had very little to do with the care of trees. Even the word "forest," which really comes from the Latin foris, meaning out-of-doors, was thought in England to be derived from the fact that it was a place given up to wild animals for rest. But gradually the forest came to be considered more than the game, and the serious study of forestry begun.

Modern Forestry.

Forestry as a science is of comparatively recent origin, although a work in which all the European trees are described was one of the earliest printed books. Until the end of the eighteenth century forestry was discussed chiefly by men who were either scholars or practical woodsmen, but who were not both. Then appeared Hartig and Cotta, two men who united these points of view, and their writings are at the base of the whole modern growth of the subject. Both were German. Each covered the whole field as it was then understood, and together they exerted an influence which has not been approached by any other authors since. From Germany their teachings spread to France, and early in the nineteenth century their doctrines were introduced into the French Forest School at Nancy by Lorentz, who, with his successor, Parade, was the founder of modern forestry in France.

Under the feudal system, which was finally destroyed in France by the revolution of 1789, the forest was the property of the feudal lord. In order to make the life of his serfs, who were useful both as taxpayers and as fighting men, easier, and so increase their number, he gave them the privilege of taking from his forest the wood which they required. For similar reasons the wealthy religious houses, like that of the Grande Chartreuse, made grants of land and of rights in the forest. But after a time the number of peasants increased so much that their wants absorbed nearly the whole produce of the woodlands. Then it was found necessary to limit the prescriptive rights to forest products by restricting them to certain parts of the forest, or to make an end of them by exchanging them for the absolute ownership of smaller areas. Thus many of the communities, to which, and not to individual peasants, these rights belonged, came to possess forests of their own. But the communes, as they were called, managed their forests badly, and about three hundred years ago the Government was forced to intervene. Under the management of officers of the government forest service, the results from the communal forests have been excellent. At present these forests not only supply fuel to the villages which own them, but in some cases they produce enough to pay all the village taxes as well.

Germany.

Germany still holds the high position in forest science which began with Hartig and Cotta. The German forest schools, of which there are seven of the higher grades, are still among the very best, and the study of forestry, both in the schools and in the forest experiment stations, is eagerly pursued. The forests in Prussia, Saxony, and other German States are admirably managed, and yield important returns. The total value of the German forests, public and private, is said to be about $4,500,000,000.

France.

Forestry in France has long been associated with the names of famous men. Henry of Navarre and his friends and minister, Sully; Palissy, the great potter, who called the neglect of the forest prevalent in his time "not a mistake, but a calamity and a curse for France," Colbert, the minister of Louis XIV; the botanist Duhamel du Monceau; Buffon, the celebrated naturalist, are among the men to whom France owes the rise and progress of her present excellent forest policy. Their peculiar service was to lay the foundation, both in law and in public opinion, upon which modern forestry in France now rests.

The forests of the French Government are admirably managed. They cover only about 2,750,000 acres, but they yield a net return each year of more than $2 per acre. Besides handling their national forests with great intelligence and success, the French foresters have done much for the general progress of forestry. They developed the art of reforesting denuded mountains, and were the first to plant trees on moving sand dunes along the seashore. More than 150,000 acres of these dunes, which once were blown about by the wind until they overwhelmed great stretches of fertile ground, and even threatened to bury whole towns, are now covered with forests of pine, and produce great quantities of turpentine, lumber, and charcoal.

Switzerland.

In Switzerland forestry received attention from very early times. Nearly two hundred years before the discovery of America the city of Zurich began to make rules for the protection and management of the Sihlwald, a forest which it still owns, and which now yields an annual return of about $8 per acre. In the Canton of Bern a decree of the year 1592 warned the people against the wasteful use of timber and provided for the protection of the forest along various lines. It also directed that for every tree cut down a young one should be planted in its place. It is curious to find this mistaken prescription for the ills of the forest already in fashion more than three centuries ago. To save the forest every old tree must be replaced by many young ones.

The first general forest law of Bern was passed as early as 1725. It embodied the most important principles of wise forest legislation as we know them today. But this was only one of a long series of forest laws in which, from the beginning, the idea of the importance of the forest to others besides its owner became steadily stronger. The citizens of Bern have grown ever more willing to place restrictions on themselves for the benefit of the Commonwealth.

There were great floods in Switzerland in 1834, and they were the cause of a general awakening of interest in forestry. Somewhat later a federal forest commission was appointed. Since the appearance of its final report in 1861 the progress of forestry in Switzerland has been steady. In 1875 a federal forest inspector was appointed, and a year later the first Swiss forest law was passed. This law does not extend to the whole of Switzerland, but only to the Alps and the steeper foothills. In a country of steep mountains it is of first importance to guard the forests on the higher slopes. Consequently all the forests on these higher lands which serve to protect the lowlands against floods, avalanches, and other similar dangers of wind and weather are put in charge of the Swiss federal forest service.

A Great Saying Of Landolt.

"Our forest laws," said Elias Landolt, a great and simple man, whose name stands first among Swiss foresters, "are intended to work more through instruction, good example, and encouragement than by severe regulations. This method is somewhat slower than one which should involve harsher measures, but the results achieved are more useful and lasting. When forest owners do something because they are convinced of its usefulness it is done well and with an eye to the future, but what they do under compulsion is done carelessly and neglected at the first opportunity. What they have come to learn in this way and have recognized as good will be carried out, and that better and better from year to year."

British India.

For many years after the British conquest, forestry in India made very little progress. Much time was wasted in half measures, until in 1856 Doctor (now Sir Dietrich) Brandis was put in charge of the teak forests of Pegu. He acted at

With the Citrus Growers

FLORIDA FRUIT EXCHANGE ASSURED.

MANY orange growers will be interested in the result of the trip of the Florida orange growers to California. Growers from all parts of that State gathered at Tampa on June 1 and from the Florida Fruit and Produce News we take the following extract:

The Florida orange growers will have an organization modeled after the successful California Fruit Growers Exchange and it will cut a large figure in the handling of the next season's orange crop.

So much was determined at the big rally of orange growers who met at Tampa Tuesday and Wednesday of this week, where they assembled, according to pre-arranged program, to hear the report to be made by Dr. F. W. Inman and the other members of his committee which recently returned from a visit to the orange growing district of California where they pursued their very thorough investigations. The following is only a brief outline of what was done:

Committee Meets.

The members of the California committee held a short session previous to the formal opening of the convention so as to get their reports in proper shape. As the convention was a continuation, or a reassembling of that held at Tampa earlier in the year under the initiative of the Florida Orange Growers' Company, J. W. Sample, of Bartow, called the meeting to order at 10 a.m. Tuesday, June first, when the Casino was well filled with some 400 or 500 auditors, all wearing orange colored badges, which had been provided by the publishers of the Florida Fruit and Produce News. A registration book also had been provided, and the delegates, as they entered the hall, each inscribed therein his name and address. An examination of this list revealed the presence of very many of the most prominent growers from all sections of the state.

Soon after the meeting had been called to order, Josiah Varn, of Bradentown, resigned as secretary and Charles H. Walker secretary of the California committee, was elected in Mr. Varn's place. Prominent figures on the stage with President Sample were Dr. F. W. Inman, of Florence Villa, chairman of the committee which visited California, and at whose suggestion and very largely through whose efforts the organization of the orange growers here was accomplished, and Col. Thomas Palmer, of Tampa, who accompanied the committee to California as its legal advisor.

A general committee on organization was appointed.

At a later session of the convention the matter of expenses of this committee was brought up. It was stated that about $2,500 would be required for incidental expenses, and more than this sum was subscribed in a few minutes by those present.

On the second day of the convention, the committee on organization made its report. After very careful deliberation of all material available, they had decided upon the following men to compose the executive committee, upon whom the chief work of organization in all its details will fall. The executive committee is composed of Thomas Palmer, Hillsborough, chairman; Eugene Holtsinger, Polk; W. S. Gray, Marion; W. C. Temple, Orange; W. A. Fulton, Hernando; J. W. Sample, Polk.

The committee's headquarters will be in Tampa and it will hold its first important meeting on Friday, June 18, by which time all the preliminary details as to legal formalities will have been attended to.

Telegrams were sent to the Legislature demanding the passage of the Humphries bill, providing for the organization, management and co-operation of agricultural, (viticultural) and horticultural non-profit co-operative associations. This bill passed the senate on Tuesday night, and was passed by the house on Thursday.

The executive committee at its meeting two weeks hence will have articles of incorporation prepared which are to be signed by representatives from each county interested, who will go to Tampa on the 18th for that purpose. It is probable that at this time some arrangement will be made with the officers and stockholders of the Florida Orange Growers' Company, of which Josiah Varn is president, to merge the interests and identity of that organization into the new Florida Citrus Exchange.

REGARDING THE CITRUS TARIFF.

The Dingely tariff act took effect July 24, 1897—1 cent per pound on citrus fruits.

For the year 1897-98 California produced 15,153 carloads of citrus fruit, of which 1166 cars were lemons and 13,987 cars were oranges.

The growers, now between 9,000 and 10,000 in number, with 100,000 acres planted, will receive this year upward of $20,000,000, less packing charges, for their crop, while about $13,000,000 is paid the transportation companies for freight and refrigeration.

The greater part of this fruit is grown upon land that twenty-five years ago was thought to be a part of the great American desert.

For the year 1900 there were 7685 carloads of lemons consumed in this country, of which 1447 cars were California grown, and 6418 cars, or 82 per cent, were imported. The consumption has steadily increased until this year (1908) we have consumed 12,110 cars, of which 5000 cars were California grown, and 7119 cars, or 59 per cent, were imported.

The digging out of lemon orchards because of poor returns to growers a few years ago was stopped and an incentive given for planting new orchards, by a favorable freight rate which does not apply to oranges.

The imports of oranges have gradually decreased from $1,097,596 in 1899 to $275,060 for 1908, while the domestic exports of oranges have increased from $282,313 in 1899 to $1,577,661 in 1908—principally to the Canadian provinces and the northwest.

The foregoing figures indicate that we are now producing more oranges than are consumed in this country, but only 41 per cent of the lemons.

The retail dealers are offering lemons to consumers at from 8 to 20 cents per dozen, as shown by printed newspaper advertisements from many states; this indicates the tariff has not increased the price unreasonably to consumers, nor would it do so if the tariff on lemons were doubled; an additional half cent per pound on lemons could not affect the price over

RED SPIDER

One of the Worst Pests Known to Citrus Trees

Is in abundance in Southern California at this time of the year. The Board of Horticulture recommends Sulphur to combat this pest.

Imperial A Resublimed Flowers of Sulphur

DOG DISEASES

AND HOW TO FEED

Mailed FREE to any address by the author.

H. CLAY GLOVER, D. V. S., 118 W. 31st St., New York

A large nursery and plant introduction garden has been established at Honolulu,

1½ cents per dozen on 300s, or 1¼ cents per dozen on 360s, and would so stimulate the industry that in the next ten years we would supply every demand for consumption in this country—just what was promised would be done with oranges eleven years ago.

Citrus fruits are perishable and must sell daily for what they will bring—over 40 per cent. are now sold under the hammer at public auction.

Our principal competitor in lemons is Italy, with orchard labor at 30 cents per day (our money) and a freight rate of 24 cents per box to New York. In regard to oranges, Italy and the West Indies are the largest exporters to this country, yet we have good reasons to guard against Mexico; orchard labor ranges from 30 to 50 cents per day in these countries, while we pay $1.50 and $1.75 per day in California.

GOPHERS.

The pocket gophers live almost entirely under the ground. They are light brown or yellowish in color, the front feet are fitted with long claws especially for digging, and the skin on either side of the head is folded into deep pockets. Ground squirrels, of which there are several kinds, are often called gophers. These little animals are rather slender and very active. They are often seen running about the fields.

The pocket gophers are quite easily killed with poisons. The United States Department of Agriculture gives the following formula for this:

Dissolve one ounce of strychnia sulfate in a pint of boiling water. Add a pint of thick sugar syrup. Scent this mixture by adding a few drops of oil of anise. Steep a half bushel of corn in hot water and allow it to soak over night. After this, drain it, and allow to soak for several hours in the poisoned syrup.

Many mounds are commonly made by one gopher and are connected by one runway. The laterals leading to the mounds are commonly filled with loose earth. Select the freshest mound and follow the soft earth back till the main runway is reached. Push the poisoned grain well back into the runway and close the opening in such a way as to prevent dirt from clogging the runway. This may be done by first putting in a handful of grass and covering with earth.

In territories where the ghopers are numerous, the co-operation of neighbors is desirable. Attention should also be given to waste lands, since these are sources of infestation.—S. Arthur Johnson, Colorado Agricultural College.

COST OF ORANGES.

The cost of producing a box of California oranges as gathered from a large number of growers and packers, exclusive of interest, is given as follows:

Cost of labor per box, 59 cents.

Cost of material used in growing and packing, 46 cents. Total cost per box, $1.05.

Cost of transportation to eastern market, including 10 cents for ice, 93 cents.

Total cost per box on eastern markets, $1.98.

Refrigeration costs 20 cents per box—for 1907, 58 per cent of orange shipments were shipped under refrigeration.

The cost of producing a box of oranges in Italy is 65 cents.

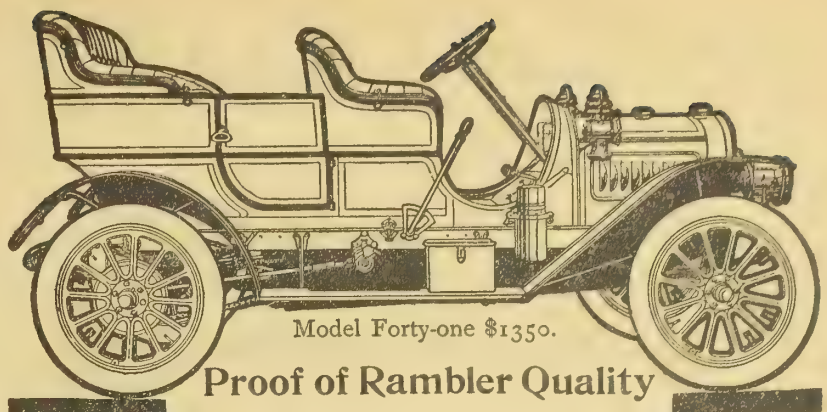
Cost of transportation to New York, 25 cents.

Total cost of foreign oranges in New York harbor, per box, 90 cents.

They pay a duty per box of 72 cents.

Total cost on the market, per box, $1.62.

An advantage still in favor of the foreign grower of 36 cents.



Model Forty-one $1350.

Proof of Rambler Quality

is found in our farm folder which you should read carefully before buying any other automobile. It contains indisputable evidence in the shape of letters and actual photographs, of Rambler economy, Rambler quality, Rambler utility, and proves that the Rambler is the standard automobile for farm use and the best for all roads.

This **Rambler** has 15¾ in. clearance between the axle and the road, long wheel base, big wheels and big tires, power plant and transmission completely enclosed, but every vital part easily accessible. It is simple to operate. Any woman can handle a Rambler with ease.

Deciduous Fruit Culture

By J. W. Mills

A GOOD FARMERS' CLUB.

EVERY time the farmers get together and talk some good is accomplished. We have heard the expression that "Farmers resolute a whole lot more than they do." This may possibly be true and, in fact, we have attended some of the conventions of the state when important matters were discussed and committees appointed to continue the work which the discussion had started, and there the whole matter "petered" out. But notwithstanding this, it is something to inspire the farmers to make strong resolutions, and there always comes some good, and often great good, from these meetings. Whether at meetings of the local grange, state conventions, institutes, or farmers' clubs, inspiration is given to some to set a higher standard for their agricultural or horticultural work for the coming year and live up to the standard.

We believe one of the best of these organizations in the state of California is the Claremont Horticultural Club. It not only takes in the people immediately around the town of Claremont, but has members from many other sections of eastern Los Angeles county who join in the discussions. This club is one of the oldest in the state and has to its credit the inauguration of many movements which have been state wide in their influence. It holds monthly meetings except that during the summer a vacation of three months is taken. The closing session of the year is usually the second Monday in June and the opening session, we believe, the last Monday in September. Both opening and closing sessions are made picnic occasions. The closing session for this year was held last Monday at Ganesha Park in Pomona. Luncheon was served, or rather dinner, for it was a good full meal, such as only farmers' wives know how to prepare.

This club has always taken great interest in such laws and political movements as affect the farming communities. One of these laws in which it has recently manifested great interest is the new law relating to the appointment of one horticultural commissioner in place of the three formerly prescribed. The club has taken an active part in pressing the candidacy of Prof. Cook, President of the club, for member of the examining board. Before it took this step it had pressed for the enactment of the law as introduced into the assembly.

That draft of the act provided that the board to examine candidates for these county commissioners should be made up by one appointment each by the state horticultural commissioner, president of the state university, and governor of the state, but the lobby of the legislature—at least so it was charged at this meeting Monday—worked to the end that the appointments for the entire examining board should be in the hands of the governor.

Mr. Fred J. Smith, one of the committee having charge of the work for the support of the bill as introduced, reported to the club that his committee had done all in their power to get the bill carried as presented, but that the political pressure had been too strong for the committee to carry it through without the amendment which deprives the law as passed of most of its benefit to the fruit growing interests. Mr. Smith also reported that the committee had been before the supervisors of Los Angeles county and made an appeal to them not to appoint anyone under the recommendation of the examining board unless such candidate were acceptable to the fruit growers of the county. This was pledged to the committee and resolutions passed accordingly, and it is now hoped that the commissioner when appointed will be a true representative of the horticultural interests of the country and not a politician. The feeling expressed at the meeting was exceedingly strong against any political machine having control over so great an industry as is the orange industry of the county in which the club members reside.

One point of immediate and more local interest discussed was as to the extent of the damage done by the recent hot spell in causing excessive dropping of the young oranges. Some members tried to take an optimistic view of the situation and claimed that the damage would be slight—much less than anticipated. Others who were not so optimistic maintained that the fruit was "all" on the ground. However, after quite a discussion, the prevailing sentiment seemed to be that while the hot weather had caused great loss to the next year's crop, there was still enough fruit left on the trees that if no further unfavorable weather was experienced, the output for the coming year would not be a total failure.

Papers relating to the cultural conditions were read, and an address given by former President Gates of Pomona College, on social conditions as he saw them in New Zealand and Australia.

Notwithstanding the wide influence exerted by this club, as mentioned above, its membership is only about one hundred, but it must be confessed that all the one hundred are alive and in heartiest sympathy with every movement of the club. Prof. A. J. Cook of Pomona College is President of the club and V. V. Le Roy is secretary.

COLORADO FRUIT PROSPECT.

So far as one can judge at this season of the year, the prospects for a large fruit crop throughout the State were never brighter. True, some damage was done by frosts early in May, but as a whole, the various localities in the State, with but very few exceptions, have come through the critical period with flying colors. Taking the State as a whole, there is promise of at least 75 per cent. of a full crop of peaches and at least a 90 per cent. crop of apples. If these promises are fulfilled it will mean the largest fruit crop by far that the State has yet produced and one which will tax the growers, as well as the railroads, to the utmost to take care of.

Some valuable lessons have been learned, all of which tend more and more to put the growing of fruit upon a stable basis. We now know that no locality in the State is entirely immune to damage from frost. Orchards, which heretofore have escaped, suffered some injury, while those in more exposed locations in the same

locality were not damaged in the least.

The value of orchard heaters was again demonstrated and the superiority of oil over coal as a fuel for this purpose has been clearly shown. A satisfactory coal pot may perhaps be constructed, but the experience with the present forms tend to show that coal fires are too slow to start and that the pots require too much attention to keep an even fire burning. —W. Paddock, Colorado Agricultural College.

GREAT INTEREST IN NUT CULTURE.

A few days ago the Georgia-Florida Nut Growers' Association held its annual meeting at Cairo, Ga. Last year it met at Monticello, Fla., and among other things took stock of the acreage planted in budded and grafted pecan trees in Western Florida and Southwest Georgia and found it to aggregate over 6000 acres. At the Cairo meeting these statistics were brought up to date and showed a total above 10,000 acres or an increase of 4000 acres in one year, or 65 per cent. The reports from nurserymen indicate a still larger increase for next season, as fully twice as many orders are booked than was the case a year ago. As far as popular data is obtainable, this section of country leads the world in this popular industry.

The eighth annual convention of the National Nut Growers' Association will be held at Albany, Ga., October 12, 13 and 14, 1909.

The light eastern fruit crop is probably responsible for the good returns which most of the orchardists are receiving this year.

At It Twenty-Four Years

THE subject of our sketch, Mr. Wm. Gregory, came to California in 1885, or twenty-four years ago. Shortly after this he located in Redlands and engaged in the sale of windmills and gas engines.

Mr. Gregory has always taken a great interest in ranch life and this, more than any one thing, enables him to supply the rancher with the best the farm needs.

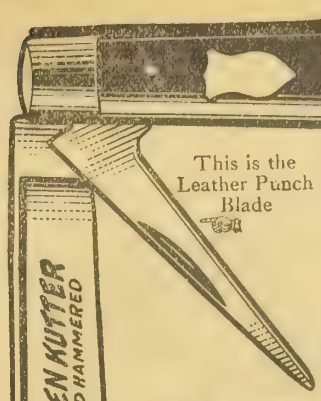
Something like ten years ago Mr. Gregory moved to Los Angeles and established himself in the gasoline engine and windmill business just north of the Plaza at which location he can be found today. At that time he took the selling agency for the White & Middleton and the Little Wonder gas engines. As to the merits of these goods it is useless for the Cultivator to make comments, as they have been before the people so long and so many of our readers are using them that we feel that comment would be wasted.

Several years ago Mr. Gregory, seeing the usefulness of the automobile to the rancher, took the agency for the Moline Limited automobile. This, with his line of engines and windmills, places him in a position to look after the wants of the rancher in the line of power and transportation.

During the past twenty years Mr. Gregory has seen great changes in California. Deserts converted into productive orange groves, prosperous ranches sprung from sage brush plains, and water brought from the mountains and from the earth have made California to blossom as the rose.

A look at his face will make the reader good natured. In fact he is a pretty good natured fellow to deal with.

Mr. William Gregory.



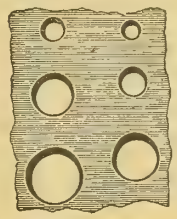
This is the Leather Punch Blade

Handy Knives

A real pocket-knife—an all-round knife—must be ready for all sorts of work. No other tool is put to so many different uses. Yet how seldom do you get one that fills the requirements.

KEEN KUTTER
Pocket Knives

This illustration shows the actual size of holes that may be cut with the leather punch blade.



are made to do all-round work. And there are Keen Kutter Pocket Knives for all sorts of work. For example: the large knife here illustrated has a leather punch-blade, invaluable to farmers and horsemen. The edge is curled over so that when the knife is turned it cuts a clean hole. All Keen Kutter Pocket Knives are guaranteed. If not satisfactory your money will be returned. If not at your dealer's, write us.

Live Stock and Dairy

By Mrs. Minna E. Sherman

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

ONE COW.

THERE are at times abnormal conditions that make the cream impossible to churn, then pasteurizing will help make good butter. Heat the cream to 160 degrees and wrap the can to hold that temperature for half an hour. Then cool down to seventy and add some good butter milk or clean flavored sour milk. A quart to three gallons of cream is sufficient. If you can secure this starter from a neighbor it is better, provided, of course, the neighbor has good butter. After that keep a small portion of the butter milk and put it into the cream can, adding the cream as it is skimmed. Churn often and do not try to keep the cream too long. The starter may be home made by going to the barn and, after milking the first few squirts of milk on the ground, milking directly into a sterilized mason or fruit jar, at once putting on the top and placing the jar in a moderate temperature of seventy to sour. Then use the clabbered milk for a starter.

Little by little the cherished ideas of the milk man fall. At one time it was made illegal to serve milk that had not been run over an aerator; now we have learned that if the milk is bottled up at once from the cows, and then chilled, it will after twenty-four hours show lower bacterial count than milk that has been aired. The long keeping milk bottled warm from the cows, that went from the United States to Paris Exhibition was, after twelve days, lower in count than the French milk that was only twenty-four hours old.

Churning.

The temperature should not be lower than 45 degrees, nor higher than 65 degrees for making butter, except in instances where everything is under control and experimental work is being done. A summer churning temperature of 55 degrees, and a winter one of 50 degrees is about what the average farmer's wife can secure. At 70 degrees the butter will come, but it will be greasy and never have the keeping quality. Twenty minutes of running the churn, at forty revolutions to the minute, will make better butter than quicker churning. The five minute churning of some cows will show great waste of butter fat in the butter milk as well as a poor quality of butter. The overripeness will have already tainted the cream and the butter will be rancid in a short time. Where there is only a small amount of butter made the cake mixer will make a good churn, or for still less amount a two quart Mason, or like type of jar, gives excellent results. The churn should never be more than scant half full, and one-third is even better. If the Mason jar is used, screw on the top and take in both hands placing one on the top, the other on the bottom and swing at the rate of forty times a minute.

Butter.

Where only one cow's milk is to be churned it is better to make it up oftener and in this small way, than to hold some of the cream until over ripe and have a larger quantity of poor quality. The removal of the milk and water from the cream by churning it and washing it leaves each butter globule coated with a film of water carrying enough salt to act as a preservative. This is no longer a home for bacteria and will not quickly grow rancid or ill smelling and tasting. Butter made often, and well salted can be kept in the spring until the scarce time comes. Nearly everyone that has one cow has an excess of butter at one time and a lack later on. The first year I was on the ranch I devised this little scheme that worked well. There were three fresh cows all at one time and too much butter. The butter was made into balls as large as could be put in the mouth of fruit jars, and as soon as a jar was filled, a good brine made by boiling and cooling the day before was poured in to fill the jar completely, and the top was put on and the jar wrapped in several thicknesses of paper. When six had accumulated they were burried four or five feet down in the ground where it kept cool. When the supply of milk became short, this butter was used and was found as good as though it had come out of cold storage.

Covered Milk Pails.

There are a number of good patents on the market and some that are worse than the open pail. Now if I am going to be poisoned with bacteria, I would rather choose nice fresh ones, newly hatched, as it were, than some antediluvian ones that had been confined to a crack in a dot of rancid milk for a week. The covered pail must have a cover that can be removed readily so that it can be given a good wholesome scrubbing. Then the cover and the whole pail should be made with pressed seams and no inside solder. The cow should have the hair clipped on her flanks and on her udder to prevent any dust or dandruff from hanging there to be dislodged into the milk pail. Avoid feeding hay during milking time and do not put it down after the cow is in the stable. It always brings more or less dust with it to light on things. Card the cow once a day and then wipe the udder before milking, and the milk will be clean and wholesome. I often feel sure that dairymen never look up! For, surely they would go after the cobwebs! I know they gather fast, but then they must come down, and if this is followed up for a time they will not be so bad. The breeding of spiders should not be part of the dairyman's occupation. He is learning fast not to breed flies and make the yards a nuisance. Now he must learn not to breed cobwebs. —M. E. Sherman.

To have pigs make good pork and plenty of it, they must be supplied with good material to make it of, and plenty of it.

Grow your own meat at home. Don't buy from the other fellow.

FLY REPELLANT.

A subscriber recently called at the office and referring to former good things in the paper said that perhaps two years ago, a fly repellant was published which he had found of exceptional merit. We give below formulas printed in former Cultivators. Let us hear from subscribers who have tried either as to their success. There are others, perhaps much better ones offered ready prepared by the trade.

Sure it is that milk supply lowers when flies are thick.

Here is a formula described by Dr. E. L. Moore of the South Dakota Experiment Station which has been found to be quite effective. It is sprayed on to the animals by means of a small hand spray pump, one application being sufficient for two days. The longer between spraying the more thoroughly the animals must be gone over. The odor of the preparation does not taint the milk, according to the above veterinarian, but the milk must be removed from the barn at once after milking, which should be done whether a spray is used or not.

Fish oil	100 parts
Oil of tar	50 parts
Crude carbolic acid	1 part

Regarding the above, Mr. W. E. Dickinson of Eureka, Humboldt Co., writes: "In a recent issue I note you want to know about a fly repellant you described in June of last year. I have this to say, I bought the dope as per prescription, at a cost of $1.25, used it about a week and still have the remainder. It will fix the flies and gum up the hairs on cows like a sheet of tanglefoot fly paper. I prefer to use common coal oil or kerosene in a common hand spray. A very small amount of the spray will kill all flies, and the mist on the hair will repel them for 24 hours. I presume if much oil were used it would take the hair off, but I have used kerosene spray for cows for nearly three years and am satisfied with it. I am always afraid of tainting the milk, but never have done so.

Another Good One.

To four quarts of coal oil add one quart of fish oil and one pint of some good stock dip; place in some vessel which can be tightly closed and shake well so as to form a kind of emulsion before applying to the cows. The above amount will spray 20 cows once a day for two weeks, according to the writer, and it will absolutely keep the flies off the cows.

Such a preparation costs from 35 to 40 cents a gallon. The best way of applying the fluid is by using a sponge or a large cloth, which may be lightly passed over the parts of the cow on which the flies are most likely to settle. This can be done in much quicker time than might be supposed.

A Good Use of Tobacco.

A simple home made wash is; steep for some time one pound of tobacco stems to make when cool about three gallons. A little turpentine, or if there be no sores, a little coal oil may be added, say an ounce to the gallon. Wash the stock thoroughly, and lice, flies and other pests will have but little use for such animals for a short time at least.

Another.

Spray or sprinkle over the horse or cow a mixture of fish oil one quart and creoline 4 ounces.

MILKING MACHINE.

From a bulletin issued by the Nebraska Experiment Station we quote the following summary of observation on milking machines:

1. Heifers in their first lactation apparently give better results by machine milking than do aged cows that have been accustomed to hand milking for one or more years.

2. Some cows are not adapted to machine milking.

3. Alternate hand and machine methods of milking have a detrimental effect upon the milk flow.

4. Manipulation of the udder is absolutely necessary in some instances before all the milk can be drawn by the machine.

5. One man operating one machine can milk about the same number of cows per hour as one man milking by hand.

It was found that two machines in the hands of one operator insured the most satisfactory work. Only 30 minutes was saved by one man operating three machines in place of two when sixty cows were milked. This saving of time would not balance the lack of thorough work when the operator was using three machines.

7. Two men operating four machines can practically do the work of three men milking by hand.

8. One operator with two machines can milk between ten and eleven cows per hour, and two operators with four machines about twenty-one cows per hour.

9. It was found necessary to thoroughly wash and boil the milking machine parts after each usage, in order to produce milk with as low a bacterial content as that resulting from careful methods of hand milking.

10. Washing the machines at irregular intervals or simply drawing water through them will increase the bacterial content of the milk even above poor methods of hand milking.

11. The man operating the milkers must thoroughly understand the care and management of dairy stock. He should also be persistent in the attention to details in order to obtain the best results.

12. From these studies it would appear that the milking machines are fitted for large herds rather than small ones, and we believe it would be impracticable to install them where fewer than thirty cows are milked the year round.

Shoe Boils, Capped Hock, Bursitis are hard to cure, yet

A Sick Man is Likely to Display Bad Temper

He should not be blamed; he should be pitied. A **very** sick man in his delirium may make awful threats, but no one need be disturbed about them.

A **very** sick separator manufacturer is just at this time making some foolish threats about patent litigation and in his delirium is attempting some things which a rational man would not undertake, and which will only exhaust the little strength there is in him.

The Sharples Separator Company

is the strongest financially of any separator manufacturing concern and is the oldest in America. Every Sharples separator is sold under a guaranty of full and complete protection to the agent who sells and to the user who buys, against any and all patent infringement litigation of every character. We are thoroughly posted on all cream separator patents and every patented feature of a Sharples separator is controlled by The Sharples Separator Company. Any claim to the contrary made by a disgruntled competitor is without grounds and made solely for the purpose of intimidation.

Tubular Cream Separators Stand Alone

in a class by themselves, the highest type of centrifugal cream separator, entirely different from all others, and no competitor has ever claimed that Tubulars in any way infringed his patents. Tubular Cream Separators are sold to the best dairymen in the world, but there are some people who insist upon buying something cheap regardless of inconvenience, loss of time, trouble to keep clean and unavoidable repair bills. Those people buy disk separators and aim to buy the best disk separators obtainable. We are building and selling by far the best disk machine—our Jersey separator—the cheapest thing we build, but nevertheless a better separator than the best of other disk machines, and which we sell at a price far below what the aforesaid "sick man" is asking for an inferior machine.

That Is Where the Shoe Pinches

And that is why the "sick man" is threatening patent suits. It's easy to understand. If you want the best separator in the world, buy a Tubular; if you want the best disk separator, buy the Jersey, and bear in mind that we guarantee to protect you and hold you harmless against patent litigation from any and every source. Write for catalog 260.

The Ornamental Garden

POINTS ON BEAUTIFYING THE HOME GROUNDS.

THE trees and plants surrounding the house are analagous to the frame of a picture and should be so arranged as to give a good background to the buildings and help to present a natural view of the place.

The soil in which the trees are to be planted is a very important consideration. If the soil is too sandy and gravelly, so as to be deficient in plant food, good success with trees will be hindered unless the soil be well fertilized. On the other hand, the soil may be too heavy but this condition can be overcome somewhat by the proper application of stable manures.

A good loamy soil is conceded to be the best for trees and ornamentals, and in some cases it would pay to haul this kind of soil to start the trees in.

The size of the hole to dig for the trees depends on the size of the plant. However, one rule can be given: Be sure to dig the hole large enough to accommodate all the roots without crowding them. Before selecting your trees, take a drive through the neighborhood to see what trees and plants are already growing with success in the yards of your neighbors; also write to your experiment station and get its list. From the two sources you can make a list of the ones that would suit your site best. Now you can go to your nursery catalogue and order your trees and plants with a feeling of assurance that they will grow if you give them the proper care and attention.

In ordering trees, do not select those that are too large, because it has been found that the best success has been secured with smaller trees.

All plants, to insure the best success, should be transplanted during the dormant season, and while they can be set out in the fall or winter, spring planting is preferable.

In transplanting, do not place the trees too close together or where they will obstruct the front view of the house. Plant shrubs and ornamentals in front of the trees, also near the house to soften the outlines, and in the sharp angles made by the walks or beds. To prevent shading of shrubs and ornamentals they should not be planted too close to the trees. When flowers are planted they should be placed in front of the shrubs, to finish the background. It is not a good plan to cut up the lawn in front of the house by trees or shrubs; a few small groups of shrubs planted in the proper places will break the monotonous outlines of the lawn.

After planting the plants they should receive good care and attention. Plenty of water must be supplied to them either naturally or artificially. The soil should never be allowed to become dry. The time to irrigate can be determined by examining the soil. If the soil around the plants cracks open too much after irrigating, the cracks should be closed by filling with soil or tamping it down. This should be done until the trees or plants are established.

Pruning the trees and shrubs should be practiced only when necessary. Plants should be pruned, to give them form, to remove extra growth and dead branches. The natural form of the trees, shrubs and ornamentals should be preserved as much as possible. Limbs removed should be cut off close to the trunk to insure quick healing of the wound.—J. E. Mundell in New Mexico College Press Bulletin

PROPAGATION OF SHRUBS.

IF home owners knew how inexpensively their lawns might be improved there would be fewer bare, unsightly yards. With little trouble and the expenditure of only a few days' work in each year the boys and girls can adorn the home with clambering vines and beautiful trees and shrubs. Many kinds of desirable trees and shrubs can readily be propagated by means of cuttings; and all kinds of vines can be increased in this manner or by the equally simple process of germinating seed.

An instance is known of an enterprising young home-improver who has grounds considerably more than an acre in extent, improved with a varied and extensive collection of shrubbery, nearly all of which is the product of a small number of stock plants procured at a cost of a few dollars. Planting material which would have cost a hundred times as much if purchased at a nursery has been produced at a surprisingly small outlay. Outside of the saving, there is a delight in growing one's own shrubbery, and, should it be desirable, the practice can be made to yield no small revenue, even in the most isolated rural community. By employing the simple expedient of propagating from hardwood cuttings, a single specimen of spirea Van Houttei, or golden elder, or panicled dogwood may yield in a single season from half a dozen to a score of thrifty, well-rooted little plants—sufficient for the formation of one or more pretentious clumps that will soon become the envy of the entire neighborhood.

The method is so simple as scarcely to merit description, yet perhaps a few words concerning it may not be amiss. In October wood of the current season's growth should be cut into sections eight or ten inches in length, neatly and securely tied in bundles of twenty-five to fifty and buried in a narrow trench in a well-drained corner of the garden plot. These bundles should be covered with earth to a depth of from three to six inches, and the warmth afforded by a mulching of straw or coarse manure will be beneficial. As early in the spring as the ground is at all fit to work, the cuttings should be removed from the trench and planted a few inches apart in rows eighteen to twenty inches distant from each other. Zealous attention to the details of weeding and hoeing should induce a vigorous growth and at the end of the first season the cultivator will be rewarded with thrifty, vigorous, well rooted stock.—Am. Journal of Agriculture.

PROPAGATING BEGONIAS.

Begonias and many other plants having thick fleshy leaves with large veins or nerves are frequently propagated by leaf cuttings. After cutting across the principal veins in several places, the whole leaf may be weighed or pegged down to the sand in the starting bed and new plants will spring from the wounded points. The leaf may be split along the mid-rib and the cut edges placed in the soil. The leaf may also be cut into triangular pieces with the point extending into the mid-rib and placed in the soil points downward.

Small Fruits and Vegetables

STARTING CELERY SEED.

CELERY is a crop that is to be transplanted. The plants must be started in a seed-bed and there cared for until they are large enough to be transplanted either into a temporary bed or to the field. Celery seed is very small, light, and slow to germinate, taking about two or three weeks to come up, and for these reasons great precautions are necessary in starting the plants. Methods employed for starting cabbage, onion, or tomato seed would, in many cases, prove failures with celery. Very few other vegetables require such careful and constant attention to the seed-bed, and, this is particularly true in this climate.

The seedlings, as they germinate, are delicate and it takes a few days before they are strong enough to withstand any neglect of the seed-bed. During this time one must not forget to water the little plants regularly or else our hot sun and drying winds will cause many of the delicate seedlings to die.

The seed-bed should be well prepared. The soil for the seed-bed should be about three-quarters of good rich loam and one-quarter well rotted and sifted manure. Do not use manure that is liable to heat. Mix the soil and manure thoroughly, rake it to a clean even surface, wet it, and then roll or pack it down. As soon as it is dry enough drill the seed in as shallow as possible. Sometimes the seed is sown broad-cast and thinly covered. While this way may give a good germination, if the seed-bed is properly taken care of, the drill method is preferable.

Mark off the rows ¼ and ½ inches deep every three inches and plant the seed fairly thick. One ounce of seed should be enough for a frame or seed-bed 6x8 feet. Cover the seed from ¼ to ½ inches deep with the finest soil possible. Immediately after the seed is planted the bed is watered, care being taken not to wash the seed out. From this time on a careful management of the seed-bed is necessary, remembering that the surface soil must not be allowed to become too dry and hard. To keep the soil from baking, it should be watered at regular intervals. The frequency of the watering of the seed-bed will depend largely on whether it is exposed to our hot suns and drying spring winds.

If the seed-bed is open, it is advisable to have it in a place where it can be sprinkled every evening if necessary. While the ideal seed-bed is one that is open or unprotected, better results in germination, and with less care, can be had here when some kind of a covering is used. Boards, straw mats, cloth, gunny sacks, and glass can be used to prevent evaporation, and to keep the soil from baking. All of these materials have been used at the Station on the seed-bed. In each case the results in germination have been quite satisfactory, but the stand has been more uniform from the beds covered with white cotton cloth. The beds covered with glazed sash may have to be watered every two days, and when the days are very hot and windy, every day. Beds covered with cloth may be watered every three or four days.

In covering the beds with white cotton cloth it is generally better to have the seed-bed made in such a way that there will be a 3 to 6 inches space between the covering and the soil. Beds made in the form of a cold frame are very satisfactory. If lumber cannot be had, the border on the side can be raised to the necessary height. It is advisable in using the cloth cover to stretch the cloth over a light frame made from inch lumber. The frames can be made 3x6 feet or larger. Such cloth covered frames are easily handled and when placed over the seed-bed the wind does not move them around. As soon as the seedlings are well started the covering can be removed. If left too long, the plants tend to grow too tall and spindling.

After the plants are well up the seed-bed can be irrigated if so desired. It is very important to have the celery plants as stocky as possible for transplanting. Stocky plants may be secured in two ways. They may be transplanted from the seed-bed to a temporary bed and from there to the field, or they may be thinned in the seed-bed and sheared off when they become too tall. The plants may be cut back a third or a half of their growth.

An ounce of seed should give from 5000 to 6000 good plants after allowing for a very large loss. Five to eight ounces of seed should produce enough good plants for an acre.—Fabian Garcia., New Mexico Agricultural Ex. Sta.

USE OF HOE AND RAKE.

Many vegetable gardens and nearly all flower gardens are too small, or improperly arranged for the use of horse tools, says a writer in The Journal of Agriculture. In such cases the hoe and rake are the proper tools for cultivation. The vegetable bed or flower bed or border that is to receive after treatment with hand tools, must be spaded and otherwise stirred and mixed to a very fine condition at the initial preparation. Most of the cultivation must be done before planting.

In the cultivation of flowers or vegetables in beds or borders, use the hoe to cut out weeds and stir the soil. Large weeds would be better pulled out than cut out, since when cut off at or very near the surface they often quickly sprout up and give more trouble. I find it better to use the point of the hoe rather than the straight blade in most cases for this kind of work. The sharp point of the hoe will stir the soil with less muscular exertion than when the full blade is used. A narrow hoe, for the same reasons, is better than a wide one.

The steel-toothed hand rake is an excellent tool for garden cultivation. Its use should follow that of the hoe. The soil can be stirred with the hoe, but it can be made fine and smooth with the rake. When a flower bed has been worked properly with a fine-toothed rake it looks neat and inviting. If taken in time, with not too much rain for packing the soil and the encouragement of weed growth, the entire summer cultivation can be done with the rake.

Cultivation with the rake can be done with more ease and rapidity than with the hoe. Quite a large garden can be made smooth and fine with it in an hour's time. The rake is the best of all tools for making a surface dust mulch in dry weather. Keep up its use in time of drought—and water the garden with the rake.

FOREST FIRES.

The State Forester has issued a circular giving a list of the fire wardens in each county of the state. A part of the circular contains warnings in regard to carelessness in the handling of fire. Probably very few people in California understand that it is a misdemeanor punishable by a fine of not less than $25 nor more than $500 and by imprisonment, to commit any of the following acts:

1. To build a fire even on your own land without first securing a written permit from a duly appointed firewarden, except camp fires, which may be built on unenclosed lands if the owner has not forbidden their building in any way, and provided the builder of a camp fire totally extinguishes it before leaving.

2. To set fire on the lands of another excepting camp fires built under the conditions outlined above.

3. To allow a fire, unlawfully set, to escape from the control of the person having charge thereof, or to spread to the lands of another.

4. It is unlawful to use any engine or boiler, burning fuel other than oil, unless the engine or boiler is equipped with adequate devices to prevent the escape of fire from any part.

5. Also to refuse to obey the summons of any State Firewarden to fight fire.

The heavy rains of the last year have caused such a mass of inflammable growth on the hills that greater care than usual must be exercised or this season will be marked by disasters even greater than last year.

By the way, our readers may not be aware of the vast losses of last year. In this state they were great. But look at those in other sections of this country in 1908: July 12 to August 2.—Crow's Nest District in British Columbia. Loss, $20,000,000. Dead, 70. Homeless, 10,000. August 16 to September 6—Northeastern Minnesota and Northern Wisconsin. Loss, $6,000,000. Dead 12. Homeless, 12,000. August 16 to September 8—Minnesota Copper Country. Loss, $5,000,000. Dead, 30. Homeless, 5000. September 1 to September 7—Black Hills, South Dakota. Loss, $2,000,000. September 1 to September 8—Michigan Peninsula. Loss, $3,000,000. September 12 to September 19—Greenville District, Pennsylvania. Loss, $1,000,000. September 1 to September 19—Adirondacks, Essex, Warren and Saratoga counties, New York. Loss, $2,000,000. Dead, 8. September 2 to September 20—Southeastern Ohio and West Virginia. Loss, $2,000,000.

REPORT ON SERUM.

As the Cultivator has often given articles in its columns from Dr. David Roberts, formerly Wisconsin State Veterinarian, we deem it but just to our readers to give the following from Circular No. 29 of the U. S. Department of Agriculture:

"For some time past there have appeared in certain agricultural and live-stock journals advertisements of 'the Roberts serum treatment' for abortion in cows by the Dr. David Roberts Veterinary Company, Waukesha, Wis. In the advertising matter sent out by that company there is an order sheet giving a list of 'remedies,' one of which is 'Anti-Abortion Serum, for preventing and curing abortion in cows.'

"In accordance with the provision of law, the Department recently examined a sample of the preparation referred to. Analysis by the Bureau of Animal Industry shows that the preparation is not a serum and contains no serum. The sample contained approximately 98 per cent of water, the remainder consisting of phenols (carbolic acid), oil of cloves, and a very small proportion of what appeared to be some form of vegetable matter."

GOOD ROADS PROJECT.

The act of the recent legislature in passing a bill providing for a state bond issue of $18,000,000 for a system of state highways, seems to have caused diverse comments from the press of the state. Papers in the counties which have already bonded themselves heavily for road improvements, oppose the move on the ground that each county should carry the burden of its own bonds. As a whole, however, the prevailing sentiment is that the state must have better roads than it has, and it is presumed that private interests will be largely set aside and bonds carried either by the state or various counties.

The movement for better roads is unanimously favored. The only diversity of opinion is as to the manner of securing the results.

POLITICS FOR FARMERS.

As a rule the farmer is a bad politician, or rather not a successful politician. Also, as a rule, the last thing he wants to be is a politician, but there are times when it is necessary for him to take a hand, and when he does, it is usually with considerable vigor.

Recently some of the best fruit growers in the state demanded a change in the horticultural laws, amongst other features, that the number of commissioners should be reduced from three, as it has been in the past, to one, and that the one should receive a larger salary, and that no one should be appointed to the position unless he first passed a satisfactory examination before an examining board to consist of three members, one to be the state horticultural commissioner or appointed by him, one from the state university or by appointment of the state university, and one to be appointed by the governor. Contrary to the expectations of the original framers of the bill, it was not permitted to pass the state legislature until it had been amended so as to make the appointment of the examining board come entirely into the hands of the governor. When this amendment was carried through over the protests of the originators of the bill, they set wheels in motion in order to secure the appointment of a board that would represent the horticultural interests of the state. At the meeting of the fruit growers of the Claremont Horticultural Club at Ganesha Park, Pomona, recently, the opinion was freely expressed that the board as appointed did not in any way represent the wishes of the fruit growers there assembled. It was also stated that the wishes of politicians were much more considered than those of the fruit growers.

If this be true, then it is time for an awakening on the part of the fruit growers when they shall demand that the interests of the fruit growers shall be considered more than those of politicians.

A GARDEN SPOT.

"The National reclamation act was passed in 1902. At that time there were in the government's name, in the 16 states affected, 600,000,000 acres of arid land, of which it was estimated possible to reclaim sufficient to support 50,000,000 people. By 1911 the Reclamation Service will have reclaimed nearly 2,000,000 acres, at an estimated cost of $70,000,000. There are 40,000,000 acres of arid lands susceptible to reclamation by irrigation. The construction cost of the reclamation works is returned to the government from the sale of lands, the proceeds to be again used in furthering irrigation development. Irrigation is making a garden spot and an empire of the 'Great American Desert' and the work of the irrigation congress is yet in its infancy."—R. Insinger, Chairman Board of Control, Nat'l Irrigation Congress.

WE SHOULD BE WISER.

Figures have been assembled to prove that owing to the frightful condition of almost all American roads, it costs 25 cents a ton a mile to haul. The superb roads of the old countries of Europe make possible the hauling of farm products at 12 cents a ton a mile. Therefore, every ton hauled costs the American farmer 13 cents more per mile than the farmers of the old country are forced to pay. The average length of haul of farm products in the United States is 9.4 miles; therefore, were our roads as good as those of France, the farmers gain would be 9.4 times 13 cents, or approximately $1.23.

STORE THE FLOOD.

Less than one-fifth, and, in many cases probably not one-tenth, of the waters of our streams is available for irrigation. It runs away to the ocean in the season when it is of no value for irrigation purposes. Many streams are so situated that this will always be; others are so located that a large part of the water may be saved for the dry season. This is a good time of the year to consider this waste which the state is suffering each year, and look ahead to the time when it may be prevented, and encourage all endeavors looking toward that end.

FORESTRY ABROAD.

(Continued from Page 683.)

once upon the idea of preserving them by making them pay. At first the output of teak had to be somewhat restricted, much against the will of the timber merchants of Rangoon, who protested that the business of their city would be ruined. But after this momentary check the teak trade of Rangoon grew until it was far greater than ever before, and it is now a chief and increasing source of the prosperity of that city.

The appointment of Doctor Brandis was the beginning of the Indian forest service. In 1866 he was made inspector-general of forests, and from that time progress was rapid. The Indian forest service now has nearly 300 superior officers and over 10,000 rangers and forest guards. It has charge of about 200,000 square miles of forest, and produces a net revenue, after all expenses have been paid, of about $3,000,000 a year. In addition, the forests furnish to peasant holders of forest rights products whose value is estimated to be considerably greater than the whole cost of the forest service. About 30,000 square miles are effectively protected against fire, at an average yearly cost of less than half a cent per acre. These admirable results are especially interesting because India is like the United States in the great extent and variety of her forests and in the number and fierceness of forest fires.

Agricultural Notes of the Pacific Coast

Northern California

Winters farmers are to be given a new rural route delivery.

Hay prices are proving exceptionally satisfactory to the farmer.

Peach growers at Oakdale are thinning out their tremendous crop.

Mixed cars of fruit are now going forward from the Sacramento Valley.

Peach growers near Gridley are thinning their peaches for the second time.

The third State University butter contest was held at the Davis farm last week.

A creamery plant at Willows, Glenn county, is in trouble over legal complications.

Winters, Yolo county shipped its first tomatoes and corn on the last day of May.

Winters, Yolo county, shipped the first green corn out of the Sacramento Valley.

The grape crop at Woodland, Yolo county, is reported to be in exceptionally fine condition.

Auburn, Placer county, fruit growers have organized a co-operative fruit marketing company.

Land in Glenn county formerly given to beet culture raised immense crops of grain this year.

Ukiah, Mendocino county, was visited by a late frost which did much damage to young vineyards.

The beet fields at Princeton, Colusa county, are reported to average not far from fifteen to twenty tons per acre.

As a rule hay producers are holding their hay expecting a higher price than buyers seem inclined to offer at this time.

The barley crop of one Willows, Glenn county, ranch will produce thirty sacks to the acre and that from a volunteer crop.

A large eastern syndicate is purchasing quantities of land at Willows, Glenn county, which will be sub-divided and sold in small holdings.

The demonstration train has been returned to Davis and Sacramento and dismantled. The train covered about 3500 miles in its various trips.

Work has been commenced on the construction of ditches for the Feather River Canal Co., in Butte county. These ditches will cover land in the vicinity of Biggs and Nelson.

The experiment farm maintained by the United States reclamation service in connection with the reclaimed oil land project at Orland is showing remarkable results with the irrigated garden truck planted this season.

The Farmers' Protective Association at Healsburg recently held its annual meeting and re-elected its former officers. The association has forwarded $700 to the state grower's association to assist in protecting the wine industry of the state.

A company which is reclaiming a large body of land near Sacramento offers to sell reclaimed land and guarantees to each purchaser absolute protection from floods. In case the high levees, which are being constructed to insure keeping out the floods, should break, a fund is to be provided to cover any damage that may come.

Central California

A large winery was recently destroyed at Tulare by fire.

A new cannery is to make its initial run this year at Bakersfield.

Large plantings of eucalyptus have been made this spring near Pixley.

Irrigation water is more abundant in most parts of the San Joaquin Valley than usual.

The latest addition to the farmers union movement is that of the wine, honey and melon men.

Lindsay has proven to be an unusually profitable berry growing section during the past season.

One Hanford sheep grower shipped a train load of 31 cars of fat sheep to Kansas City last week.

One farmer near Hanford reports a yield of nearly 34 tons of grain and alfalfa hay from nine acres.

A legal contest is on between the "riparians" and "appropriators" in the Kings county Superior Court.

With old crop raisins going at 2¼ cents, raisin producers are feeling somewhat better than for some time.

The horticultural commission of Kings country reports 100,000 eucalyptus trees planted during the past season.

Leaders of the farmers' union movement report many fruit growers signing contracts for the coming season's output.

Supervisors of Kings county have been petitioned to take preliminary steps looking toward improvements in the Tule river country.

Some ranches in Tulare county are being fitted with the pipe system of irrigation which will handle the water much more economically.

Bee men of Fresno county are concerned over the prevalence of black brood. The county bee inspector reported 218 colonies infested out of 1338 inspected.

The new pumps at the Copo de Oro water plant near Bakersfield are delivering 90 inches of water very successfully. The plant cost about ten thousand dollars to install.

The live stock inspector of Kings county reports inspection of many dairies during the last month, and as a rule the animals are healthy and the dairies kept in excellent condition.

Colonel Hersey of San Jose predicts that prunes will vary in value from $15 to $30 per green ton, size and perfection being the basis of value. He also predicts that dried prunes will bring at least 3 cents.

Owing to the reclamation of lands belonging to Miller and Lux, much land belonging to individual farmers was flooded last month near Bakersfield. The farmers cut the Miller and Lux levees in order to release the pressure on their own levees, and it is rumored a law suit will result.

Delegates from the various local district organizations met recently in San Jose and organized a county body which will be known as the Santa Clara Valley Fruit Organization. The temporary directors elected are: H. A. DeLacy of Coyote, R. P. Van Orden of Mountain View, J. T. Dunn of Palo Alto, A. M. Kelley of Morgan Hill and William T. Topham of Berryessa.

Southern California

Banning has a new ice plant.

Date trees near Coachella are setting full of fruit.

A produce exchange is being organized by the producers of Imperial Valley.

Daily refrigerator car service is operated between Imperial and Los Angeles.

Santa Ana orange growers have formed a new orange shipping association.

Beaumont apricot crop will be lighter than it was estimated earlier in the season.

Work is progressing rapidly on the $3,500,000 good roads system of Los Angeles county.

The Gregory Canning Co. at Colton has been overhauled and enlarged for the season's run.

Escondido is waking up and subdividing small tracts of land into smaller holdings.

Oranges around Casa Blanca are all shipped and the packing houses are all closed for the season.

Present indications are that the cantaloupe industry of Imperial Valley will be a money maker this year.

The few hot days at the first of the month have caused great damage to the orange and some other fruit industries.

An Imperial Valley rancher has been convicted of taking water from ditches at a time when he was not entitled to it.

Imperial Valley creameries are putting out a higher grade of butter than they have been able to in the past warm seasons.

The Ventura County Lima Bean Growers' Association is appealing to all bean growers in California to join the new association.

It is evident that this season's output of citrus fruits will be the greatest ever, some estimates placing it as high as 35,000 carloads.

A brush fire covering a square mile of land and damaging many ranches, partly destroyed an apiary at Brookside near Redlands last week.

Notwithstanding the Colorado river is approaching its highest point, the flood is not within eight feet of the top of the levees thrown up to protect the Imperial Valley.

The interests of the Bear Valley Water Company in the lands about San Jacinto and Hemet have been disposed of to the Los Angeles Reservoir and Pumping Company.

The restoration of entry on lands of Imperial Valley has created a great rush of business for the land office. The month of May was the greatest in the history of the Southern California office.

The California Fruit Canners Association at Los Angeles has put up great quantities of berries this season. It is reported that this concern has contracted for over a thousand tons of small fruit.

Highlands, Redlands, and many other sections reported that more than half of next year's output of oranges has gone to the ground because of the extreme heat of the last few days of May and the first of June.

The Coast

Texas claims to have been the first state to harvest wheat this year.

Garfield, Wash., reports the largest output of grain ever in its history.

1909 hops are readily being contracted for at Portland for twelve cents.

Arizona cattlemen are receiving from $18 to $21 a head for cattle sold this year.

Yuma is to have an ostrich farm using forty large birds for a foundation stock.

Orchard land in Colorado with bearing trees is selling for $1000 to $4000 per acre.

The Willamette Valley prune orchards are heavily loaded and an immense crop is promised.

The Colorado Agricultural College estimates the cost of growing an acre of cabbage to be $21.80.

Ritzville, Washington, is to have a grain elevator constructed with a capacity of 60,000 bushels.

"Ideal growing weather" is the verdict of wheat growers in the great wheat belts of Washington.

Three hundred dollars in cash is to be offered for the best display of apples at the A-Y-P Exposition.

The acreage of wheat of Union county, Ore., was thirty per cent greater than that of last year.

The Washington State Grange Patrons of Husbandry held its annual meeting at Ellensburg June 1st.

The management of the creamery at Yuma has recently been changed and increase of capacity is promised.

Yuma county, Arizona, has a good roads association which is moving toward having better roads for that county.

Whitman county, Wash., estimates a harvest of 13,000,000 bushels of wheat. The 1907 crop was 10,000,000 bushels.

The farmers near Clagstone, Idaho, are making a concerted attack on the ground squirrel pest, using poisoned field peas.

It is estimated that over 100,000 people from the United States will settle in British Columbia during the coming summer.

Heavy rains which visited the State of Washington about the first of the month were of great advantage to the grain farmers.

A Salem, Oregon, manufacturer has invented a threshing machine which is said to be the finest flax machine ever used in that industry.

The Colorado river is now at the 26 ft. stage, and it is expected that it will go close to the 30 ft. level before it reaches its highest point.

Late spring causes heavy loss to the fruit growers of British Columbia. The dominion fruit inspector reports less than half the usual output.

Shipments of cattle from the ranges in Cochise, Pima and Pinal counties, Arizona, will bring the owners at least $150,000 during the month of June.

Yuma papers deny that any bamboo has been shipped to that section for planting, as rumored, but state that another year will see much planted at the experiment farm at the Indian reservation.

FOR MOULTING HENS

Feed

MIDLAND

Poultry Food No. 4

$1.95 per Sack

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

SOME MISTAKES IN FEEDING YOUNG CHICKS.

I HAVE raised poultry for many years and it has taken a good deal of experience to get me to the point where I can raise the young chicks without losing a large number each year, writes W. M. Underwood in Poultry. There are some mistakes that practically all beginners make.

The digestive organs of the chick are very tender and it is not a difficult matter to feed foods that will greatly injure the tender mucous lining. I remember one year that I gave the chicks a lot of wet bran. They filled up and some packed their crops full. The slow movement of the bran into the gizzard allowed the wet bran to ferment in the crops of the chicks. I was unable to save some of the chicks that went down under that kind of feed. Bran is a good thing for a part of the ration, but my own experience has taught me that it is not best to feed it as the only food.

One mistake in feeding that I have observed among some poultrymen is the giving of too much wet meal at a time and leaving the spoiled stuff where the chicks can get at it. A chick has no more sense than a hen and will peck at this kind of remains till the crop is full of a fermenting mass. For some reason I do not understand, the crop of the chick is unable to push much of that kind of food into the gizzard. When it gets into the gizzard it causes bowel complaint, for the digestive processes are not able to handle it to advantage.

For the first feeding of young chicks I find hard boiled eggs very good. The egg is of the same nature as the food in the digestive tracts of the chicks when they are hatched. It is, therefore, easily digested and gives the chicks a good start. Frequently eggs can be used that are unmarketable, being a little too old to be strictly fresh. This is a better use to make of them than to sell them to people who think they are getting strictly fresh eggs.

It is a mistake to feed a chick too young. I always let my chicks go without food for a day or more after they are out of the shell. In the meantime they are digesting and assimilating food that nature had placed in them before birth.

Corn meal, especially coarse corn meal, is good to feed to the chicks when they are but a few days old. It should be fed dry. It is easily digested and can be fed for a long time after the chicks have gone out from the maternal roof.

Bread crumbs also make an excellent food. The fact that they are hard and dry improves them from the standpoint of the chick. I think myself that they are more wholesome than fresh bread. Why not? We say that stale bread is more healthful for people than new bread and the digestive system of the chick is very delicate.

Oatmeal, especially the steel cut oatmeal, is particularly good. Oats contain just the elements that are needed by the growing chicks. The amount of protein in oatmeal is very large. There is also an element called avoine which has a stimulating effect on the eaters.

Meat meal is to be recommended highly. I have tried it and found it to give most excellent results. Any kind of meat is good, but the meat meal consists mostly of the lean meat and bone ground up and I think it is better than the fresh meat. However, the latter is good, and where a bone cutter is at hand fresh cut bone with the meat on it makes a good feed.

Young chicks especially like kaffir corn and it is worth about the same as corn for feeding.

Needless to say, the chicks should be provided with fresh, clean water.

FIGHTING RED MITES.

WE clip the following from an Australian poultry paper which shows that mites in the antipodes are pretty nearly as hard to combat as those of this country. They were sure tough ones.

In former years early in the season, I have soaked the roosts of my hen house with crude oil, and have had but little trouble with lice or mites. This year, however, has been an exception. Through carelessness, or laziness, before I was aware of it, my houses were literally alive with the little red pests.

First I tried my old remedy, kerosene, crude oil and crude carbolic acid. It did not seem to be of any benefit. I inquired of my poultry friends and found they were all in the same boat. I was advised to smoke the houses with sulphur. I did that, and the lice only seemed to grow fat on that treatment. The next advice was to whitewash. I mixed a barrel of whitewash and, with my spray pump, I literally soaked all parts of the houses, removing roosts, drop boards, and all movable things. The next morning the lice seemed to be just as thick on the roost as ever.

I then tried smoking again with sulphur with the addition of tobacco dust. The lice seemed to increase on the roosts. Next, with a torch, I burned the roosts every morning, until the wood seemed to be all charred, and again they were just as thick as ever. I was advised to try boiling water, which I did a few mornings with the same results.

I began to get discouraged, and bought some of the advertised lice killers. The directions reminded me of a bedbug killer I read about when a boy, viz: A party not having got good results with the preparation, complained to the agent. The agent said the way to use it was first to catch the bug and squeeze him until he opened his mouth, then drop some of the liquid into it and he would strangle.

The lice killers were about the same; catch the hen by the legs and thoroughly dust all parts of the hen with the powder.

Now, for a person with a few hens that may be all right, but to catch and dust a hundred hens, two or three times a week, to say the least, is rather trying to one's nerves and patience. Besides, I fail to see how that would affect the mites on the

perches. I tried only a few, as it was too much like useless labor.

I looked in my poultry books, and they said to keep up a constant warfare, or something to that effect, but they didn't say what to fight with—shot gun or arbitration. I concluded the authors didn't know. Then as an experiment I dusted a bunch of lice with a little tobacco dust, and was surprised to see them all die immediately. I tried the spray pump and whitewash again, and while the perches were still wet I sprinkled them liberally with tobacco dust, and the next morning the perches were all covered with lice—all dead. So I think I have solved the problem of red lice, as I haven't seen one since.

POULTRY QUERIES.

Preserving Eggs.

Will Mrs. Metcalf kindly tell me how to use water glass for preserving eggs.—A. L. C.

Boil and cool pure water. Use 9 parts water to one of water glass. Put the solution in a jar and set in a cool place, and add fresh eggs until jar is filled to within two inches of the top, always being careful to keep eggs two inches below top of solution. For packing use only perfectly fresh clean eggs, and do not use those that need washing, as that removes some of the mucilaginous coating which helps preserve the eggs.

The cost is less than two cents per dozen, and they will keep perfectly and be excellent for all purposes save boiling, when they are liable to burst open. It is best to buy the "dissolved glass," rather than to get the dry powder as that must be boiled for hours to dissolve, a tedious process.

Other names used, are silicate of soda, soluble glass, and water glass, but most druggists will understand the term, "dissolved glass," all right.

Value Of Feeds.

I should be pleased to learn through the columns of Cultivator, the different food values of yellow corn, millet, wheat and barley for chicks. I should also like to know what time chicks should be hatched to get best prices for broilers and roasters, and when to market same. Do you recommend feeding alfalfa green, or the dry, as a mash?—C. E. H.

By chicks, our correspondent means birds six weeks old and less, and no barley should be fed to these, then rolled barley may be added sparingly to their grain diet. Yellow corn has a nutritive ratio of 1 to 10; millet, 1 to 6 7-10; wheat, 1 to 6½,, and barley 1 to 7. Neither one of these grains nor all combined form a balanced ration, or perfect food, but must be combined with food containing more protein, say 10 to 15 pounds of protein to every 100 pounds of the above mixture. This is best obtained in pure beef scrap. A good grade of beef scrap contains about 65 per cent. of protein. For the first three weeks of a chick's life it should have little else but prepared chick food, and green alfalfa, which must be cut fresh daily. The best time to hatch chicks in this section for broilers is during the months of January and February, as the best prices are obtained during April and May. The holiday trade is best for roasters, which should be from four to six months old.

Alfalfa should be fed both dry and green. The meal cannot take the place of green food, but contains many elements of egg making, besides forming bulk. The green alfalfa is rich in mineral matter, much of which is lost by drying.—Mrs. Frank Metcalf.

RAISING CANARY BIRDS.

Raising canary birds is a pleasure to many people. I have been raising birds for seven years and have had considerable experience in that line. I have the St. Andreasburg Rollers and German crossed with the green and brown linnet. I have not had any trouble in raising them and have never had any disease among them. The singers are easily sold at $2.50 each and colored females at 75 cents each. You can easily get more for solid yellow ones as they are preferred by most people, although some claim the dark ones are even better singers than the yellow ones. They can be shipped safely any distance; shipping cages cost $1.25 per six.

I buy seeds separately and do my own mixing, also feed light bread, biscuit, corn bread, but never cake or anything else sweet. They relish light bread dipped in milk. I feed boiled or baked potatoes without salt. My birds lay from three to five eggs and rear from three to four broods in one season. In one nest of five I had three singers, in another nest of four I had three singers.—Poultry Tribune.

Coulson's POULTRY FOODS

Growing Chick ...Food...

Can be fed damp as a mash or dry in hoppers. Feed it to your chicks up to 3 months old. Gives rapid growth and health.

It will save your grain bill, and you cannot afford to be without it.

Coulson's POULTRY FOODS

EGG FOOD

At this time of year the hens are apt to begin falling off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting they are likely either to take a long time over the molt or if they molt quickly to have another molt in the late Fall.

A scientificially prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS and keep your flock in healthy condition for the molt.

General Agriculture

THE RAT PROBLEM.

THE rat is believed to be the worst mammalian pest known to man.

Not only does it destroy property worth millions of dollars every year, but it is now known to be the principal agent in disseminating bubonic plague. This is not a contagious disease in the ordinary sense. The infection is spread from rat to rat and from rat to man solely by means of the rat flea.

The United States Department of Agriculture, through its Biological Survey, has recently given the rat problem serious attention. The results of that work have appeared in a bulletin on The Brown Rat. There are several species of rats, but the common house or barn rat, the so-called "Norway rat," is the most widespread and by far the most destructive. By means of ships it has been carried to almost every part of the world, and wherever landed it has proceeded to make itself at home.

The species has wonderful adaptability to climatic and other conditions. In North America it is found from Panama to the Yukon Valley and to Greenland.

The rat's bill of fare includes almost everything eaten by man, and a considerable number of things not included in human dietaries, as, for instance, carrion, mice, kid gloves, ivory, and horses' hoofs.

Among the most common foods of rats are corn and other grain. If fed on grain alone, it is estimated that one rat will eat 60 cents worth in a year, while of oatmeal, it will consume $1.80 worth. If we suppose the number of rats in the United States to be equal to the number of horses, cattle, sheep, and hogs, it would cost more than $100,000,000 a year to board them on grain.

But the damage done by rats is not to be measured by what they eat. Through pollution of food products they do as much damage as by eating them. Besides they do great damage by digging under buildings and embankments, by gnawing woodwork, by cutting holes in sacks, and by cutting up goods and papers to make nests. They kill young poultry and squabs. They steal eggs. They frequently destroy the nests of wild birds. They have been known to gnaw holes in lead pipes, and they cause fires by gnawing the insulating covering from electric wires where they pass under the floors or inside partitions. They also cause fires by carrying and gnawing matches.

Though a serious pest on farms, rats commit their greatest depredations in cities. An attempt has been made to secure from the business men of Washington, D. C., estimates of the annual losses due to rats and mice. The data secured indicates losses exceeding $200,000.

The rapidity with which rats multiply is the main reason why man appears to make so little headway in their destruction. The females give birth to large litters of young, and the intervals between the litters are short. More than 20 young rats have been found in a single nest, and it is safe to estimate the average litter at more than 10. It has been calculated that a single pair of rats and their progeny breeding without interruption and suffering no losses would in three years increase to more than 20,000,000.

The author of this bulletin says hawks and owls, especially the latter, destroy great numbers of rats, a good work which man should encourage. Weasels, minks, and skunks are also rat destroyers. He recommends the persistent use of traps and poisons. But he thinks the most promising lines of effort lie in (1) rat-proof construction of buildings, especially the use of concrete in foundations; and (2) reducing the food supply of rats by the disposal of garbage, and the protection of food supplies.

Sheep Near Calexico.

LOVE OF THE COUNTRY.

The Spokesman Review of Spokane is asking representative people over the country for opinions as to effect of country life on its people. In her reply Mrs. M. E. Sherman of Fresno—"Our Mrs. Sherman"—says:

"Grown people that have carried the bloom of life fresh in their hearts love the country; they find joy at every turn, at every season of the year. In the vineyards and orchards poetry and philosophy find their fullest illustration. The eye thrills with the beauty around it and the artistic sense is fully satisfied. The pictures in the mind are those of the impressionist school—those of the emotions defining the landscape and reflecting the mind of the individual at every turn.

The love of the country, of the green fields, of the young animals is found in the heart of the natural child. Slum children, warped into a forced and matured worldiness present the weird combination of a child without love of nature. In the country little hands find useful things needing care at every turn, work and play combined—developing the mind, body and soul into perfect balance.

The following poem by Miss Krout is probably not as well known to people as it should be—considering its tuneful truth. Miss Krout gave us the pleasure of her company the other day for a brief while. She is now on her way to South America, having come from the South Sea islands. She is a woman whose work has gone into the daily papers and magazines rather than into poetry. Accomplished and interesting, she is full of love of the country."

The following lines are pronounced by John Boyle O'Reilly to be the finest verses he ever read. He republished them four times and declared he liked them better every time he read them:

Little Brown Hands.

They drive home the cows from the pasture
Up thro' the long, shady lane,
Where the quail whistles loud in the wheat field
That is yellow with ripening grain.

They find in the thick, waving grasses
Where the scarlet-lipped strawberry grows;
They gather the earliest snow-drops
And the first crimson bud of the rose.

They toss the hay in the meadow,
They gather the elder-bloom white;
They find where the dusky grapes purple
In the soft-tinted October light.

They know where the apples hang ripest
And are sweeter than Italy's wines;
They know where the fruit hangs thickest
On the long, thorny blackberry vines.

They gather the delicate sea-weeds,
They build tiny castles of sand;
They pick up the beautiful sea-shells,
Fairy barks, that have drifted to land.

They wave from the tall, rocking tree-tops,
Where the oiriole's hammock-nest swings;
And at night-time are folded in slumber,
By a song that a fond mother sings.

Those who toil bravely are strongest,
The humble and poor become great;
And from these brown-handed children
Shall grow mighty rulers of state.

The pen of the author and statesman,
The noble and wise of our land—
The sword and the chisel and palette,
Shall be held in the little brown hand.

—Miss M. H. Krout.

The garden is usually annually fertilized. Early and frequent cultivation mixes the fertilizers with the soil and makes of them a uniform mass of plant food. The more manure and other fertilizers are mixed with the soil the more good they will do. It is impossible to mix them too much. The trouble with most of us is that we do not mix them half enough. The good gardener and the good baker never fail to mix well their soil and dough. They can not hope for good results without it.

Irrigation and Forestry

EARLY DEVELOPMENT OF SACRAMENTO VALLEY.

FROM Bulletin 207 issued by the Department of Agriculture, which is devoted to Irrigation in the Sacramento Valley—written by Samuel Fortier we quote:

During the nearly eighty years of Spanish and Mexican rule in California the great central plain, with its 400 miles of arable lands stretching between the Coast and Sierra ranges, was the abode of Indians, wild animals, and an occasional white trapper. Its transformation into cultivated fields was the work of Anglo-Saxons. Were it not for the large tracts of land on the borders of the interior streams which were given away under both Spanish and Mexican rule, little would remain of the influence of that period. Neither the upper portion of this central plain, known later as the Sacramento Valley, nor the lower portion now designated the San Joaquin Valley, received much benefit agriculturally from that chain of missions which was established along the coast from San Diego on the south to San Francisco on the north.

The efforts of the Spanish missionaries were not directed to any great degree toward the improvement of agricultural practice. Their methods and those of their followers were of the crudest and far behind those of the Americans of that day on the Atlantic seaboard. As late as 1848 a forked limb of a tree, shod with a piece of iron and drawn by oxen hitched by the horns, served the purpose of a plow. The harrow was a bundle of brush, the reaper a sickle or a knife, and the thrashing machine the hoofs of young horses.

There was no commerce and the manufacturing was limited to the use of homemade looms and wine presses and crude attempts at tanning leather. Native horses were so cheap and numerous that they were frequently killed to save the grass for cattle, which were valued chiefly for their hides and tallow.

From an agricultural point of view, the first half of the nineteenth century in California is important chiefly as being the period of the Spanish and Mexican land grants. Before the termination of Spanish rule in 1822 about thirty ranches or farms had been granted. As a means of colonization under Mexican independence the number was greatly increased, and in 1846 no less than eight hundred large tracts containing some of the best land in the State had been given away. These land grants have from that day to the present exerted a powerful influence in shaping the destiny of this Commonwealth. At the cession of California to the United States in 1848 there were comparatively few Spaniards or Mexicans north of San Francisco, and the influence of these, outside of a few prominent individuals like General Vallejo and Senor Martinez, was not sufficient to make any lasting impressions. In no sense is this true of the land grants along the Sacramento River and its tributaries. These have so controlled the agricultural as well as the commercial and social development of that part of the State that it would not be possible to convey to minds unfamiliar with the situation a correct idea of the irrigation conditions and possibilities of this valley without some reference to the size and character of the landholdings.

The following summary shows that prior to 1848 grants aggregating 980,399 acres had been made to residents of the nine counties in the Sacramento Valley. The number given in the table is slightly in excess of the number of original grants for the reason that a few were subsequently divided by county lines. Thus, for example, the Capay grant to J. Soto, comprising 44,388 acres, was cut in two by the north boundary of Glenn county. This political division left 20,388 acres in Tehama county and the balance in Glenn county.

The Rancho del Arroyo Chico, situated in the heart of the valley and owned by the late John Bidwell, may be taken as a type of those that were successfully managed. This grant comprised 22,214 acres. As early as 1857, 225 acres were planted to wheat, 75 acres to barley and oats, and 8 acres to corn. There were on the ranch also at that time 1,200 bearing orchard trees, 15,000 vines, 600 cattle, and 500 horses. About 25 Indians were employed constantly, and not infrequently from 15 to 20 white men. The farm structures consisted of a large adobe dwelling and outbuildings, a wooden store and granary, blacksmith and wagon shops, barn, and flouring mill. Improvements made on this ranch more than kept pace with the general agriculture in the valley, and from this small beginning the cultivated area was increased in twenty-three years to 9,000 acres in wheat and barley, besides a corresponding increase in orchards and a doubling of the live stock.

During the past half century many of the old grants have been subdivided, but the numerous large estates which have been acquired since the United States gained possession have tended to make this part of the State one of large holdings. In 1892 the late W. H. Mills estimated that the holdings of 100 proprietors in the Sacramento Valley aggregated 1,600,000 acres, or an average of 16,000 acres to the landlord. The year previous, William Ham Hall, ex-State engineer, in a report on the central irrigation district, located in portions of Glenn and Colusa counties, stated that 40 owners held 89,000 acres of the total of 156,550 acres comprised in the district, yet this district when compared with the entire valley, if one excepts a few large ranches, is one of small rather than large holdings.

Stirring the soil to the depth of three, four or five inches covers up and kills weeds, opens up the soil for the admission of air to the roots of the plants, mixes the ingredients of the soil, and breaks the surface to prevent capillary water from escaping by evaporation. All these things are necessary for healthful and rapid plant growth.

The water at Roosevelt dam on June 1st stood at the 110-foot level.

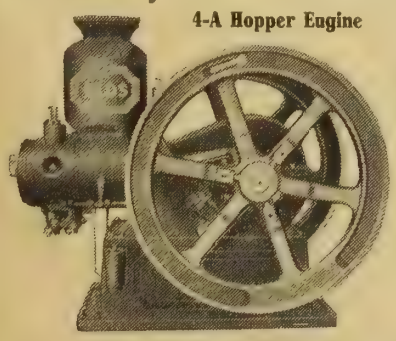
For Your Pocketbook's Sake---Read This

I am so confident that the Olds Engine is the most economical and most durable engine you can buy that I will make this proposition to every buyer of an Olds Engine.

I agree to replace, free of charge, any part of an Olds Engine that breaks or becomes worn, from any cause whatsoever, within one year from date of shipment, provided the replacement is one you think should be borne by the manufacturer. You are to be the only judge. There is to be no argument, no delay in returning old parts and getting new ones; you decide and I abide by your decision.

J. B. SEAGER, Gen'l Mgr.

Do you think this proposition could be made on any engine but a practically perfect one? You can easily see that to stand this supreme test of durability and perfect workmanship it must be built right, of the very best material, of the simplest construction. This is the kind of an engine you want. You take no chances in buying an Olds. All of my representatives can furnish these repairs without any delay. They do not have to consult me. Write to my nearest agent. He can fix you out with the best engine you can buy, no matter what others cost.



4-A Hopper Engine

OLDS ENGINES

Give you the power you need at the price you can afford to pay for it.

Some of the Features of the Olds Engine

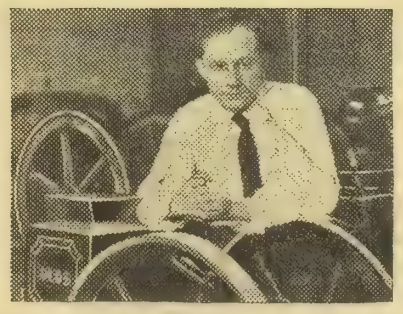
Olds Patent Seager Mixer—The only one that makes a perfect mixture of gas and air, giving the greatest power. No pump to leak or get out of order—No moving parts.

Removable Valve Mechanism. Removable Water Jacket. Jump Spark Ignition. Piston and cylinder ground to a perfect fit, giving better compression and more power.

Simplicity, three separate inspections, durability, economy and certainty of operation.

Our catalogue explains these points in detail.

Olds Engines are of the highest efficiency at the very lowest price because we can produce them without wasting a penny's worth of labor.



J. B. Seager, Gen'l Manager

I guarantee every Olds Engine that leaves the factory to be in perfect running order. I do not spend much time in the office. I am out in the shop with my coat off watching every detail. By keeping right out among the workmen, seeing that all the little things are actually done, I know the engine you get is all right, and that the high Olds standard is maintained. I also know the engine is "Best by every test," because I look after the testing and inspecting myself. They are the best you can buy, whether you pay less or more than the Olds price.

Write me about your own particular case. Let me advise with you. What I can tell you will fit your case exactly. Then you can decide what engine to buy. J. B. SEAGER, Gen. Mgr.

Do Not Think of Buying an Engine Without Investigating an Olds

Write Today for Our Handsome Catalogue

It contains many fine pictures of the very latest models of Olds Engines with a detailed description that makes the engine question as plain to you as an open book. It contains letters from farmers who have used the Olds Engines, and they give their practical every day experience with it.

Olds Engines are made in all sizes to suit every kind of work on the farm. We have exactly the kind of engine you want, Tell me what you want to do with it, and I will tell you just exactly the kind of engine you want to buy to do the work. It will be an expert opinion that costs you nothing.

Our hopper jacket engine on skids or wheels, 3 to 12 H. P., is ready to run when you get it. Fill it with gasoline, throw on the switch, turn the wheel, that's all. No piping to connect, nothing to set up, always ready, can be moved anywhere.

We also make regular engines 3 to 50 H. P. for heavier work.

Every Olds Engine is fitted with the Seager mixer which is recognized as being the most effective mixer that has ever been invented. No pump to leak, no moving parts to get out of order. They also have a removable water jacket so if through carelessness the water should freeze but very little damage is done.

It is to your decided advantage to send for our Catalogue.

Do it now before you forget it. A postal card will do, but better still write me a letter, telling me what you want the engine to do, and you will get a personal letter from me that will give you the facts you want.

Write me or my nearest representative.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Oiling Reservoir.

Is it practicable to build reservoir for water in sandy soil by coating with crude oil, mixing oil and sand by harrowing? How much oil is necessary per 100 square yards?—D. S. J., Redlands.

We have written to practical farmers asking this question, but as yet have been unable to secure definite replies. If any of our subscribers know of any experience along this line, we should appreciate communications from them on the subject. We know this, that some dirt reservoirs have been made which at first failed to hold water, but which were afterwards made fairly "water tight" by hauling in small amounts of adobe and penning sheep within the banks in order to tamp and pack down the adobe. Whether or not oil used in the same manner will accomplish the same result we do not know. We should appreciate any information as to this also.

Cherry Plums.

Is it advisable to plant cherry plums on Myrobalan roots? Is this a budded variety or grown from the pits? Does the fruit have a ready sale? What kind of soil is best adapted for it?—F. M. K., Escondido, California.

We cannot of course give advice as to the commercial possibilities of any fruit, because it is impossible to determine as to how many will be planted by other orchardists, and as to how extensive the market will be. Cherry plums are early and a very desirable little plum and in small quantities we imagine they will always demand a good sale. If a large production should be made it is barely possible the demand might be exceeded. As to whether they are grafted or budded on Myrobalan or peach root depends on the soil in which they are to grow. If the heavier damper soil, by all means use the Myrobalan. In lighter, warmer soil use the peach root. Of course the fruit may be grown from the pits if desired, but as is probable with all seedlings a mixed up and valueless lot of fruit will result.

Cow Pox.

Please tell us a remedy for what we suppose to be cow-pox. We have a cow in the herd that has large sore spots on her teats, from which yellow matter runs. Some of the sores have scabs on them.—Mrs. A. H. H., Santa Cruz.

Take the cow affected out of the milking string, as the trouble is contagious and will be carried from cow to cow by the milker's hands. When first taken give a good dose of epsom salts, a pound to a pound and a half according to the size of the cow. Give half an ounce of hyposulphite of soda night and morning in the drinking water. Sponge the udder off before milking with one ounce of hyposulphite of soda dissolved in a quart of warm water. Repeat this after milking. Then dust the sore with powdered charcoal or paint with glycerite of tannin. If the teats are greatly inflammed use the milking tube carefully sterilized to draw off the milk. The trouble will pass within a few days if it is promptly handled.—M. E. S.

Book on Ensilage.

Please tell me how I may obtain your book or pamphlet on Silos and Ensilage?—C. B. W., Escondido.

I have not written one. Send to the Department of Agriculture for the Government Bulletin covering the subject. My writtings on silos are in the back Cultivators. I think the matter of building is very fully gone into by the different companies that advertise silos for sale.

Milking.

Kindly tell me whether to milk a fresh cow dry if the calf does not use all the milk; also what to do with a swelled udder?—Mrs. D., Gardena.

A cow should be milked only enough to relieve distention for the first forty-eight hours if the calf is left with her; if the calf is removed milk her every five or six hours a little. After forty-eight hours the danger of colapse from milk fever is over and then she may be milked out clean. Bathe swelled udder in warm water or rub with hot lard.—M. E. S.

Breeding.

What do you consider necessary in order to breed a young cow in excellent health that passed examination by veterinary? She gave her previous calf two and a half years ago and is still giving from two and a half to three gallons of milk each day. Owing to conditions it was not possible to breed her till about six months ago, but though trying about five times she appears not to be in calf yet.—F. J. N., Delano.

Have some one that understands cows examine her to see that the mouth of the womb is not closed. Half an hour before breeding wash her out with a quart of warm water having a teaspoonful of baking soda dissolved in it. At one time we used to inject a pint of warm active yeast twenty-four hours before breeding. At present this treatment is discredited, yet in some cases it worked admirably without injury to the cow. If the soda water fails, then get breeding powder. If you could secure the privilege of turning this cow out with a herd that had a bull running with it, she would probably come out all right. Many cows must be bred at the beginning instead of waiting to the end of the period. Where the cow is taken from home, people wait until the last minute to be sure before making the trip.

Curl Leaf.

I enclose leaves of peach and grape fruit. Please inform me what is the trouble with them? They are from young trees set out last fall.—I. X. L., Inglewood.

The peach leaves are badly infested with peach leaf curl. Nothing can be done for it until next winter when spraying with Bordeaux will be beneficial to the trees during the succeeding summer. The grape fruit leaves have been forwarded to Prof. Smith who will answer later regarding them.

Killing Out Blackberries.

I have a large patch of dewberries and Lawton blackberries which I have been trying for several years to destroy with the hoe. Can you tell me how to make a tool to be used with team, to cut them off underground, or is there any such tool on the market for sale?—E. H., Occidental.

Have your blacksmith make a knife from a steel bar, about one-half inch thick and three inches broad, tapered at the front to a thin edge and filed sharp. Twenty or twenty-four inches is long enough, and this can be attached to any one-horse cultivator by a couple of strong iron feet or shanks that fit to the cultivator same as teeth. Set it so that it will cut two and a half or three inches underground. Persistent cutting for one season will destroy these vines, but the cutting must be persistent. I know of no tool for this work that is kept in stock.—Q. A. L.

Cover Crop.

Kindly tell what is best winter crop to secure humus in sandy loam in this section? Is vetch, Canadian field pea or cow pea better? Also what clover is best?—E. S., Turlock.

The vetch, or the Canadian field pea are good. Which is to be preferred causes a difference of opinion. As a rule we think the vetch is gaining in favor. In no case plant cow pea. That is more properly a bean and will not stand the cooler weather of the winter months. We do not believe that clover has been used in this state, as either of the above mentioned is much to be preferred.

Dairy Questions.

Where can I buy a Guernsey cow? Is the covered milk pail a success? In using it I find much more foamy milk than when milked into the open bucket. After standing twenty-four hours the cream seems to retain much of the air. Are the coolers considered a success? Does the long exposure to air more than offset the advantage of cooling?

Guernseys may be secured of the J. M. C. Marble Co., H. W. Hellman Bldg., Los Angeles. As to the other questions see Mrs. Sherman's article this week and last. From her standpoint it seems that the covered milk pail is a success if it is the right kind. As to the coolers the inquirer will note she does not consider it essential and possibly it is even detrimental. The quick cooling should be secured by other means.

"Black Bugs."

What is the remedy for black bugs on pumpkin vines? Every plant which has the bugs is wilting.—V., Kerman.

Having no further information as to the kind of bugs, it is very hard to prescribe. If it is the aphis or plant lice the application of kerosene emulsion or tobacco extract spray will be of benefit. But the bugs reproduce so rapidly that they will probably soon come back and the spraying be necessarily repeated. If the vines have been attacked so as to have lost their vitality, then for the sake of next year's crop it would be well to pile straw over them and burn and destroy the bugs or aphis so that they will not infest next year's crop. Too many farmers allow the dying vines to remain as a host plant for these pests on which to

Three Stroke Self Feed Hay Press

breed and propagate their species another year. As soon as this infestation appears it is wise to begin the burning and destroying.

Summer Pruning Of Apricots.

Will it hurt apricots if pruned three weeks after the fruit is picked? The orchard consists of good cultivated soil but is not irrigated. The trees are in full bearing.—Subscriber, Watsonville.

We think as a rule apricot growers give their trees a good thorough summer pruning soon after the crop is off. When possible this is followed by irrigating, but in any case we think there will be greater probability of full crop next year to prune as soon as the fruit is well off the trees.

More "Bugs."

Will you kindly print a remedy to destroy the bug which is stripping the leaves from our small fruit trees. We cannot find anything on the trees, but the ground is full of brown bugs.—F. D. A., Chino.

This is another case where it is impossible to prescribe without any more definite information. There are various kinds of bugs, a million or less, which injure fruit trees. We have never seen however a case where the leaves have been stripped from trees. But assuming this insect is a leaf eater, we can prescribe the application of an arsenate or Paris green spray. If the Paris green is used mix Paris green with water at the rate of a pound to two hundred gallons, or it may be applied dry, a pound mixed in several pounds of air slacked or hydrated lime.

Foul Brood.

How can I clean out foul brood and save my bees?—Subscriber, Leon.

This disease is too subtle and serious to be successfully eradicated by following any offhand advice that might be offered. The best thing to do is to apply to the bee inspector of your country, Mr. W. F. Rawson of Hemet. He will visit and assist you personally, and without charge for his services.—H. E. H.

Planting Loquats.

Can you give me some information as to how to start loquats from seed? —H. T. Y., Yuma Arizona.

As there exists a great difference in the vitality inherent in individual trees, one should select seeds from the strongest growers and thereby secure correspondingly vigorous stock. The seeds should be as fresh as possible. The germ of the loquat seed is pretty sure to die within a month or six weeks unless kept damp. Place the seeds in a small box, mix and cover with soil and keep moist, but not soggy. In about three weeks they will show signs of development and may be transferred to the seed bed. Any roots which appear may be broken off without harm to the seed. Plant from one to two inches apart, about an inch deep. The bed should be kept shaded and damp and treated much the same as an orange seed bed. In from four to six months transplant to pots or cans and after the young plants are well established, say in about four weeks, they can be transferred to the field nursery where they should remain for from nine months to a year before budding.—C. P. Taft, Orange.

Castor-Oil For Dogs.

A subscriber at Watsonville has written asking if castor-oil is good to give to dogs and suggesting that she has heard that it is not beneficial to horses and cows and thinks possibly it will injure the dog. Will say that the veternarian of the Cultivator recommends its use for dogs and so far as we have ever heard it is an excellent remedy.

A HOT SUMMER ON THE WAY.

As the balmy spring days swing by, one by one, and the coming of summer is heralded by an occasional hot day, it all serves as a reminder of the heat of previous summers and of the fact that no matter how hot the coming summer may be, there will be the usual work to do in the kitchen.

In homes where the work is done on a hot coal or wood stove, the situation is a particularly trying one—as it means added heat and discomfort—to say nothing of the trouble of carrying coal, wood and ashes; of having to wait for the fire to get started; and of having to keep it going when not actually needed.

But there is now a way by which all this unnecessary discomfort and trouble can be easily avoided—a way by which the cooking, baking, washing and ironing may be done without having an extra degree of heat in the kitchen. This happy result may be accomplished with the New Perfection Wick Blue Flame Oil Cook-Stove, a wonderful cook stove so constructed that all the heat is concentrated in the cooking, baking, in the heating of the irons and wash boiler, without being thrown off into the room to make an unbearably hot temperature.

Besides this great feature of comfort, the convenience must also be considered; and it is here, too, that the "New Perfection" excels the coal and wood stove. It is ready for business the moment the match is applied; it can be turned "low," "medium" or "high" at will; or, if required, three different sized flames can be had at the same time.

There is no stove work that the "New Perfection" will not do. From morning till night—from Monday to Sunday—from wash-day to baking day its usefulness is without end. And it does its work so quickly. No waiting for fire to get started—no late meals—no uncertain results.

The "New Perfection" burns ordinary kerosene and soon saves its own cost in fuel-economy. It is the only oil stove with a cabinet top—a feature which gives it the appearance of a modern steel range. Meals can be kept hot after they are removed from the blaze. It is also fitted with drop shelves that may be used for keeping hot the tea or coffee pot. Shelves can be folded back when not in use. Also has racks for holding towels.

Another home comfort is the Rayo Lamp, a lamp that produces a clear, steady light of unusual brilliancy, and yet so mellow as not to hurt the eyes. Made of brass, beautifully nickeled, and having a handsome shade, it is an ornament to any room, and can be used with equal satisfaction in the library, dining-room, living room, parlor or bedroom.

The New Perfection Wick Blue Flame Oil Cook-Stove and the Rayo Lamp are two articles of real home comfort, and are effecting a great saving of time, trouble and health in thousands of home everywhere.

$16.30 buys this handsome six-hole Nickle-Trimmed Cast Range direct from the Manufacturer

without high shelf. With high shelf, just as shown in the cut, $19.97; large ovens, six cooking holes, best quality of iron. Burns coal or wood. Handsome nickle trimmings. OUR TERMS are the most liberal ever made. You can pay after you receive the range. You can take it into your own home and use it 30 days. If you don't find it exactly as represented, the biggest bargain you ever saw, you won't have to keep it.

Will bring you a booklet describing their famous **"Kapokeen"** Mattress, which has all the good points mentioned and many more. Write today

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT,** soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Household Department

EACH IN HIS OWN TONGUE.

A fire-mist and a planet,—
A crystal and a cell,—
A jelly-fish and a saurian,
And caves where the cave-men dwell;
Then a sense of law and beauty
And a face turned from the clod,
Some call it Evolution,
And others call it God.

A haze on the far horizon,—
The infinite, tender sky,—
The ripe rich tint of the corn fields,
And the wild geese sailing high,—
And all over upland and lowland
The charm of the golden rod,—
Some of us call it Nature,
And others call it God.

Like tides on a crescent sea beach
When the moon is new and thin,
Into our hearts high yearnings
Come welling and surging in,—
Come from the mystic ocean,
Whose rim no foot has trod,—
Some of us call it Longing,
And others call it God.

A picket frozen on duty,—
A mother starved for her brood,—
Socrates drinking the hemlock,
And Jesus on the rood;
And millions who, humble and nameless,
The straight, hard pathway plod,—
Some call it Consecration,
And others call it God.

—William Herbert Carruth.

HER FIRST BEAU.

THE rosy cheeks cherry lips and dark eyes of Nannie McGee were enhanced by a real charm—a coyness of manner that robed her youthful innocence. Nannie was but 16, yet she was not too young to realize the damage done by her weakness, as she frequently saw others preferred before her, girls who were more forward though less lovable than herself.

"Invite Jamie to call on us; will you, mother dear?" she ventured to ask, as the young man who had all but won her heart, advanced toward them.

"You are too bashful, Nannie. Why don't you do it yourself? I wouldn't be lettin' th' girls laugh at me," said Mrs. McGee; and then, addressing Jamie, who was approaching them, his face beaming with good nature: "Good mornin', Mr. McGuire. How are you this foine mornin'?"

"O, I'm away up," said James McGuire. "I hope you are both well."

"We are real well," said Nannie.

"Shure, an' you must come an' see us," said Mrs. McGee.

"I shall be pleased to," said he, as he smiled roguishly at Nannie. "Will this evening be soon enough?"

"Indade an' it is, James, an' th' sooner th' better," said Mrs. McGee.

When they had reached home Nannie received orders from her mother to prepare the sitting room for the occasion; and the young girl made a beautiful picture of life's budding flower, her sincere dutifulness beaming through her buoyant, dilated hopes, as she gayly tripped about and dusted and re-arranged the old pieces of furniture in their little parlor.

At seven o'clock a gentle rap at the door, made Nannie's heart beat fast. "I love him—I know I do—and I'm afraid he won't like me," she was thinking as she opened the door.

But Mr. McGuire was a bright young man, seven years her senior, and he declared to himself, "I am in love with a bashful beauty, and I shall make a conquest possible." Accordingly, he brought with him a stereoscope and a number of fine views, that he might carry young Nannie out of her self-consciousness with a pleasant intellectual training.

Mr. McGuire thought it to his interest to be very close to Nannie, as he placed the pictures and held the scope to her eyes, and at one time he hit her forhead a little rap with the handle. Nannie placed her finger on the spot and laughed girlishly.

But Mr. McGuire declared that he would have to make the examination, so he arose and imprinted a kiss upon the offended flesh. "That's the way we cure babies," said he. And it happened that the mother, who was in the adjoining room, looked at that very moment from over her spectacles and through the open door. She must have seen it, as she whispered to herself, "Arrah! phwist! aisy!"

The evening advanced, and as Mr. McGuire continued charming, and being charmed, Mrs. McGee decided that "the neighbors might be criticisin'" so she walked quietly into the room, spectacles in hand, and as she did so the clock struck ten times, ten loud, heavy strokes, during which time silence reigned. At the last stroke Mrs. McGee said, while looking sympathetically upon the two young people, "Shure, the clock is unmannerly!"

Mr. McGuire threw back his head and laughed heartily, taking it as a good joke. "That's right, mother," said he, "the clock does not speak pleasantly," and continuing: "Perhaps I had better ask permission to call you mother?"

"You may call me mother whenever you like," she said.

"For the rest of my life?" queried Jamie.

"Yes, said Mrs. McGee, "for the rest of your life."

"Then I say good-night," and tapping Nannie's curly head with his hat, he said, "I spent three of the happiest hours of my life with you." Bowing an adieu to Mrs. McGee he took his leave.

When the door closed behind him, Nannie, while looking at her mother through wide eyes, said: "Am I engaged?"

"Faix, an' that's what they calls it," said Mrs. McGee.

About the House

JUST ABOUT TOWELS AND SOAP.

IT IS now known that many skin diseases and forms of sore eyes are contagious and for this reason the most scrupulous precaution should be taken to protect the other members of the family, and the only safe way is for each member of the family to have his own towels and soap. The kitchen roller towel should be abandoned and in its place plenty of the small cheap towels provided and this will be no imposition on the wash woman for it is easier to wash a number of small towels than two or three large ones.

Towels should never be put away damp for a mold may form on them that is said to be very injurious to the skin.

Save all the fragments of nice toilet soap and fill soft flannel bags with the pieces and use them in the bath. They make a fine lather and every small bit of soap can be used up. Another good way to use up the small pieces is to put them in a small pan and place them on the back of the stove. When they get heated through, stir

When writing advertisers, mention Cultivator.

in a little powdered borax, then flour your hand and mould the melted soap into a small cake and the soap will do good service again.

Fat of any sort that has lost its freshness may be laid aside for soap, hard or soft, and by buying a can of reliable potash you can make nearly all the soap you will need. Full directions come with each package of lye and quite a number of blocks of snow white soap can be made at the merest trifling cost. Before turning the melted fat into pans to cool, stir in a tablespoonful of borax which has been dissolved in warm water, and if the soap is to be used for the toilet a little oil of rose can be added, and a pound of borax dissolved in hot water and stirred in a newly made barrel of soft soap before putting it away will save three-fourths of the labor of washing as the borax softens the water and the fabric will be much whiter and cleaner.

It takes only about one-half hour to make the nice white soap and after it is made it should be left to dry for several weeks before using when it will become hard and white.—A. M. H.

HOMEMADE CHEESE.

As I have never seen a recipe for homemade cheese as simple and easy to make as the recipe I use, thought I would send one.

First go to your druggist and get a bottle of rennet tablets; and if you want your cheese yellow get a bottle of cheese coloring. The tablets come twelve in a bottle and cost 25 cents per bottle.

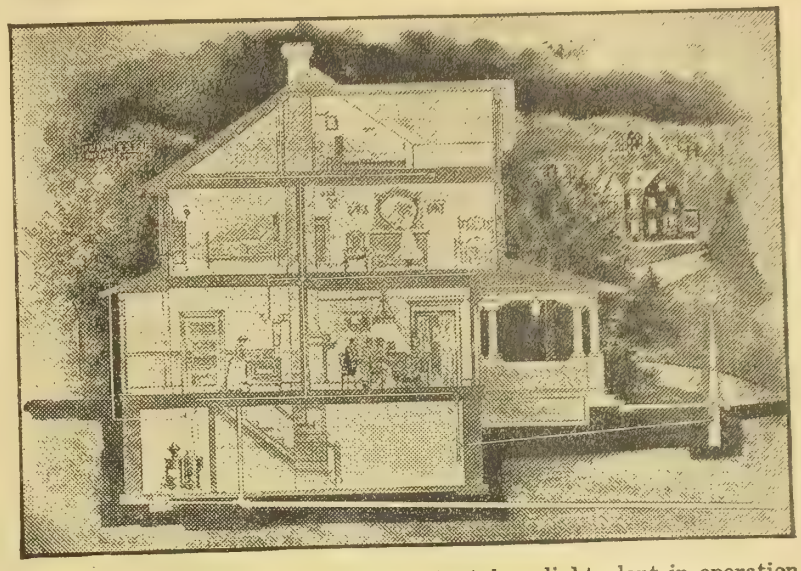
Strain ten gallons of milk into your wash boiler. If you haven't enough morning's milk, use the milk from the night before, but be sure it is sweet. Place on stove and dissolve one-sixth of a coloring tablet in a half teacup of cold water and stir into the milk till thoroughly mixed. When the milk is a little warmer than when it came from the cow lift the boiler from the stove and add one rennet tablet, previously dissolved in a half cup of cold water. Stir for two minutes. Then cover with a tablecloth folded several times and let stand for one hour, when it will look very much like clabber milk cheese. Now place a thin cloth in your colander (a piece of old toweling or the inside sugar sack will do) and lift out several handfuls of cheese. Work and press out all the whey you can and pack into cheese mold. For a mold I use a bread steamer. Place a square of thin cloth in the steamer and pack the cheese as solid as possible. Sprinkle each layer lightly with salt, using about one tablespoonful for the whole cheese.

When your cheese is all packed into the mold place something flat on top. The bottom out of a cake tin does nicely. Set your flatirons on this and leave for twenty-four hours. Remove from mould and place in a cool, dry place, and turn every day for a month, when it is ready to eat, although it gets better by standing longer. Cheese made in August will keep till warm weather comes again.

These directions may sound complicated, but are really very simple after you have tried them, and the cheese is as good as any bought at the store.—Mrs. A. J. S.

"We were put here on this planet to overcome obstacles for ourselves, but there's a heap of us that find it easier tu turn th' job over tu lawyers."

Light and Cook with Colt Acetylene



Here we have a sketch showing a Colt Acetylene light plant in operation. You will note that it is a very simple outfit that can be installed in any house without trouble. The small machine simply sets in one corner of the cellar or shed on a low platform, and is connected with chandeliers in every room, by small pipes running inside the walls, out of sight. That's all there is to it—just the machine, the fixtures and the pipes. Over 150,000 country homes, churches, hotels and stores are lighted by such plants. You can obtain full information concerning Colt Acetylene plants and installations, fixtures, stoves, etc., by addressing

Hay.

Arrivals of hay during the week just past that have come into the San Francisco market have amounted to 3250 tons. This is a slight increase over what we have been receiving the preceding two weeks, and shows that more hay is gradually being baled and rushed into this market to relieve the tense situation that developed when the end of the old crop was in sight.

Old hay is practically out of the market.

The majority of our arrivals consists of wild oat hay, which is bringing here from $11.50 to $14.50 for the medium class, and from $15.00 to $16.00 for something exceptionally fancy; new wheat hay is gradually increasing in volume, but not enough has been arriving of this class of hay to supply the usual demand. Therefore No. 1 lots of wheat hay and of wheat and oat hay have been in demand this week, and have sold at fairly high figures. With the increased movement of wheat hay to the market, which is expected to develop, will no doubt cause a more moderate range in prices being established.

Somewhat of hay has been selling in the country during the week for shipment to San Francisco, but such sales in the main consisted of lots that were baled or about to be baled, and could be immediately shipped in to the market.

Deciduous Market

SACRAMENTO, CAL., June 12, 1909.

The market on cherries has declined this week, which is due to the poor condition on arrival. The supply has decreased materially, in fact, only small shipments will be made next week.

Alexander Peaches have been in good demand, as well as Clyman Plums. The shipments of Alexander Peaches decreased very noticeably during the later part of the week, and there will be a lull in peach shipments until the other varieties come in freely.

Cots have sold exceptionally well. Shipments of cots from the Vacaville and Winters section will decrease somewhat as the crop is light.

The following is the range of prices in the auction markets yesterday:

Chicago; Black Oregons $1.10 to $1.30, Royal Annes 45c to $1.35, Tartarians 70c to $1.45, Alexanders 85c to $1.35, Bings $1.55 to $2.15, Royal Cots $1.85 to $2.05.

New York; Tartarains $1.00 to $2.10, Royal Annes $1.10 to $2.10, Biggereau $1.10 to $1.85, Alexanders 75c to $1.50, Royal Cots $1.10 to $2.10, Biggereau to 2.50.

Boston; Tartarians 85c to $1.45, Biggereau 95c to $1.35.

On June 8th the following buying prices were established in Newcastle: Alexander peaches 50c, Triumph peaches 60c, Clyman plums 60c, Red June 75c, Newcastle Cots 65c, Royal Cots 75c, Royal Annes 90c, Black Oregons $1.00.

The quotations to the Eastern trade are as folows: Alexanders $1.00, Triumph $1.00, Cots $1.25, Plums $1.10, Royal Annes $1.25, Black Oregons $1.35. —T. C. Tucker.

Citrus Market

LOS ANGELES, June 16, 1909.

The indications are that the 6000 cars of Valencias which are now estimated to be the output for the present year will command a fair return. If the output should reach the estimate, it would be more than double that of any preceding year. Present prices are ranging close to $2.00 f. o. b. California. This is not a record price by any means, but one which will prove entirely satisfactory to Valencia men if maintained throughout the season.

Next year's Valencias seem to be indicating a fair setting of fruit but the navels have dropped very badly since the first of June warm weather. Some claim that there will be absolutely no crop, but as a rule more conservative growers maintain that a fair crop may yet be secured.

Lemons are selling very readily and

at most satisfactory prices. The eastern weather has been very favorable for the last few weeks to the lemon market.

Shipments.

Total shipments of citrus fruit this year since November 1st are: 29,167 cars, of which 25,396 were oranges, 3,771 lemons. To the same date last year, 24,792 cars were shipped, of which 21,718 were oranges, 3074 lemons.

NEW YORK, June 15.—Fifteen cars oranges and two cars lemons sold. There is an easier tone to the market; prices are slightly lower. Weather clear and hot.

OF VALUE TO EVERY FARMER.

Bostrom's Improved Farm Level which is being advertised by the Palace Hardware Company of San Francisco in the Cultivator, is one of the best and simplest implements for farm use to be used either in terracing, ditching, irrigation or drainage work, that is on the market. It is easily adjusted and keeps in perfect condition and there seems to be no other farm level on the market today which even approaches this Improved Farm Level in accuracy and durability. I. A. Brady of the Bostrom, Brady Manufacturing Company of Atlanta, Georgia, at present passing through California on his way to the Seattle exposition informs us that they will have this level on exhibition at the expositio. Full information, circulars and prices can be obtained at any time by those wishing to investigate the farm level by writing the Palace Hardware Company, 581 Market St., San Francisco, or the home office at Atlanta, Georgia. A booklet with favorable comment on the work of the level will be sent on request. Every irrigator and especially one who is preparing land for irrigation should surely have one of these instruments. It will prevent errors which are expensive and often are exasperating for a lifetime.

NEW ROAD SIGN CAMPAIGN.

Five thousand doubtful points on public highways which cause confusion to motorists will be supplied within the next few months with durable road signs, properly labeled with directions, by Thomas B. Jeffery & Company, makers of the Rambler.

Two years ago five thousand Rambler signs were put up through the Middle West. A census taken shows that practically every one of these signs is still in place and giving service. As a result of this experiment, the Rambler people will put out through their dealers and others a second lot.

The signs are 12 x 24 inches in size, made of sheet metal, bearing the inscription "Rambler Automobiles" and below this a white space in which is painted the name of the town and the distance with the direction indicated by an arrow. No other advertising matter is allowed to appear on the sign. In this way the signs are made of distinct value to all users of the public highways and are, therefore, respected as ordinary advertising signs have never been.

Automobile clubs in various parts of the country which have planned a systematic marking of the roads have been given the co-operation of the Rambler people, who have supplied them with signs, free of charge, painted and ready to be placed. The movement has accordingly met with the hearty approval of motorists everywhere.

PORTABLE HOUSES.

Portable houses are being considered more in a practical way to solve the housing problem than ever before, as the demands for them from different sources, proves them to be peculiarly adapted to fill a long felt want.

The growth of the ready-built, portable house business from an insignificant, experimental proposition is one of the industrial surprises of the last decade.

After years of experimenting there has been perfected a portable house of correct proportions and stability, at the very least possible cost. In addition to economy in cost, many other advantages are claimed, among them being attractiveness, possessing considerable architectural beauty and the short time required for their erection.

The houses are manufactured in sections and in erecting, it is necessary only to bolt and screw sections together. They can readily be taken apart and set up again without damage, should it be found desirable to change their location.

The materials used in the house are the best thoroughly seasoned Redwood or Oregon Pine and are so substantially made that they will withstand any climate.

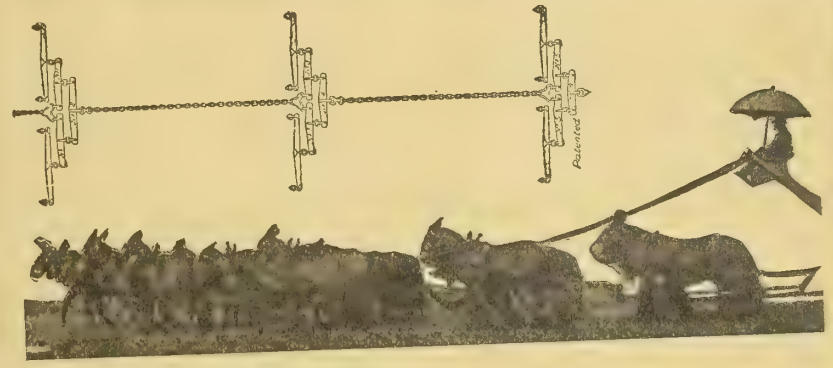
The Pacific Portable Construction Co., Inc., of Los Angeles, Cal., manufacture these houses and have erected their factory for the sole purpose of manufacturing portable houses, and are so located as to get the best shipping facilities. This factory is particularly equipped for this purpose and has been running to its fullest capacity to supply the demand for their houses. The work is under the direct supervision of Mr. F. W. Barker, who has had twenty years of experience in this line, and it has enabled them to put on the market a house possessing durability, compactness, style and strength, that can be easily transported and quickly and readily erected. A request will bring their catalogue if you mention the Cultivator.

A DRY YARD NECESSITY.

Of all the products of the orchard which must be handled quickly the apricot stands first. The fruit often ripens so fast that it is impossible to secure the help to cut it all. Cutting and pitting by machinery was long considered an impossibility. But for the past few years a little machine has been doing such magnificent work that it is found in nearly all yards and considered worth many men. It is the Briggs New Improved Fruit Pitting Machine. It is easily run by one man and will pit a ton of 'cots per hour or two tons of peaches. Besides it makes a clean cut of fruit which is as satisfactory to the trade as the hand cut. This is a good year to begin the use of such a machine.

The Briggs-Knight Mfg. Company of 336 E. 2nd street, Los Angeles, is the manufacturer and show large number of commendations from pleased patrons.

The Schandoney Equalizing Hitch



Positively Prevents Runaways

They are more expensive than these HITCHES. Why take the chances? Anybody can drive, it doesn't require an expert. Over four thousand of these HITCHES now in use, and not one a failure. Write today for further information, Catalogue, etc., to

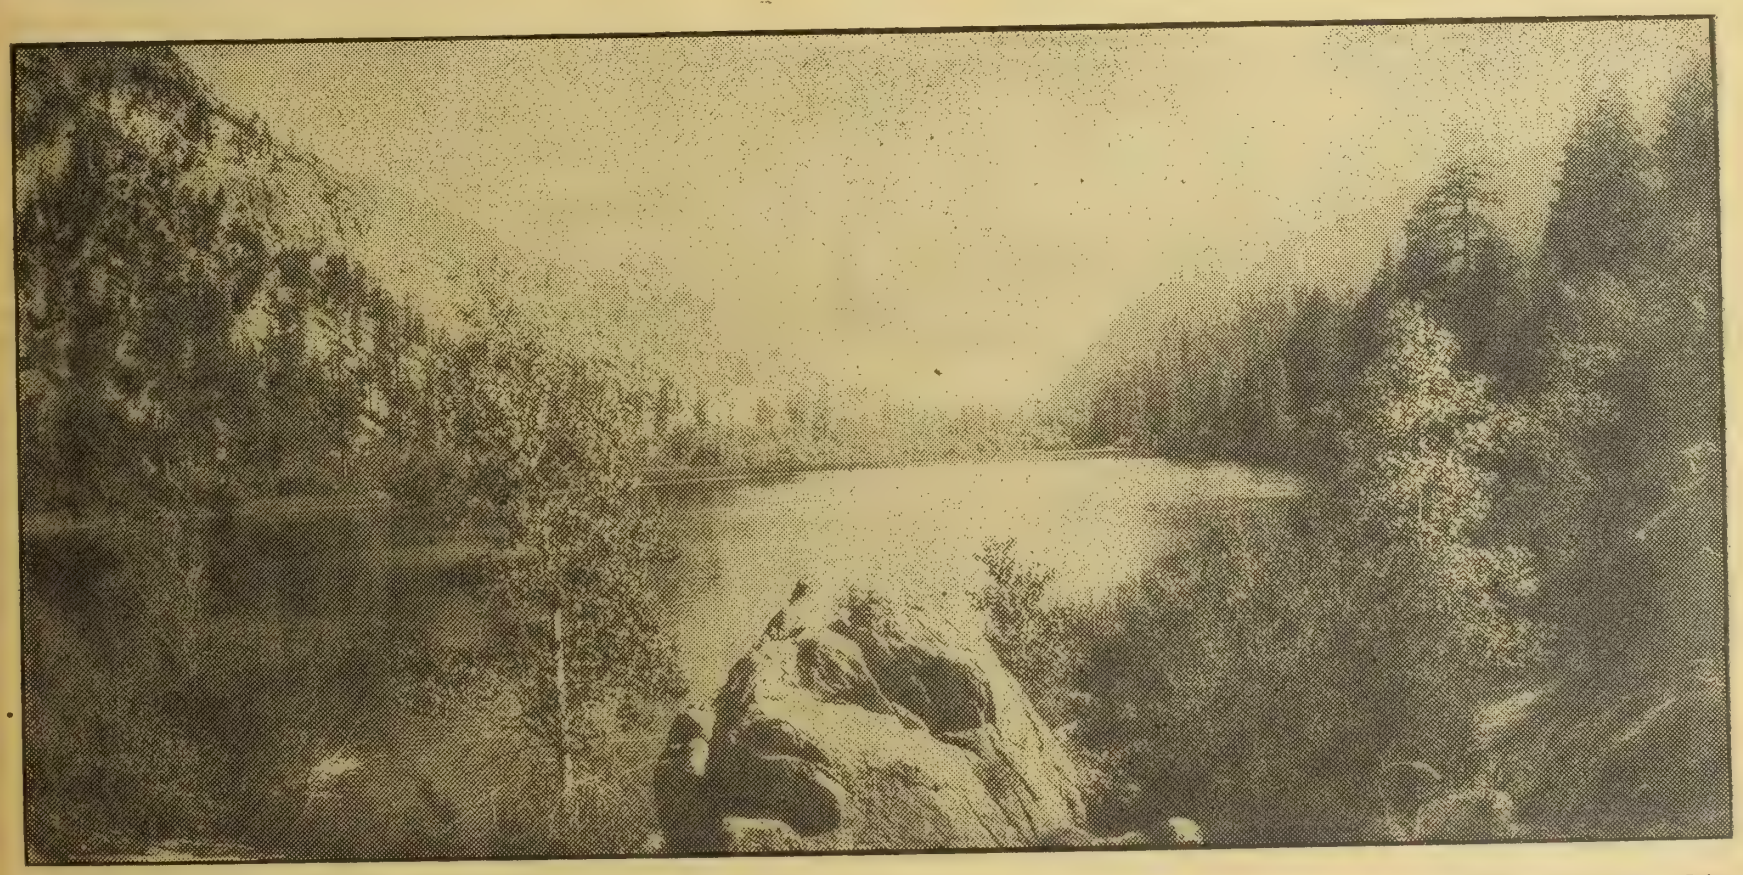
Published Weekly — One Dollar a Year

Los Angeles — June 24, 1909 — San Francisco

A Mountain Lake in Kern County

Source of Some of the Wealth of the Rich County at the Head of San Joaquin Valley



Courtesy Bakersfield Echo.

"AN immense area of fertile soil, the greater part of which yet waits its first subjection to the plow, a supply of water for irrigation, abundant and easily accessible, and a climate that works hand in hand with the husbandman throughout the entire year make Kern county the land of promise and fulfillment to the farmer, the stockman, and the dairyman and the horticulturist.

"The large picture on this page, of a little mountain lake nestling among the pine-hung peaks of the high Sierras, gathering the waters from the snows that melt late in summer, to be sent down to the rich valleys, thousands of feet below, gives faint illustration of the great resources of Kern county.

"In variety there is everything from pretty mountain meadows and valleys, forests of pine, thickets of chaparral, rocky gorges and canyons covered with soft wild grasses and a scattering growth of oaks, lower hills with nothing but the short, winter-growing grasses to clad their round shoulders, warm mesas where only the lightest of frosts ever fall, and the broad, level, sunbathed plains of the great valley, walled in and guarded by its encircling hills.

"Every agricultural crop grown in the United States thrives in Kern county, from the wheat of Minnesota and the corn of Iowa to the cotton and rice of the gulf states. All the fruits—except those of the tropics—apples, peaches, apricots, plums, prunes, nectarines, pomegranates, oranges, lemons, limes, pomelos, olives, and all the grapes that ever made the vineyards of Spain and Italy fruitful, grow here in their perfection.

"All the gifts that nature can provide lie here, waiting for the hand of industry—not sparingly and grudgingly, but in the greatest profusion, plenty for thousands and tens of thousands who are willing to set their hands to the plow and do not ask that manna, baked and buttered, fall from the skies."

Future Citizens of Kerman, California

J. W. Brooks, J. B. Deardorff, J. W. Lamb, J. W. Cook, E. M. D. Smith, C. E. Wells, C. F. Anderson and L. W. Brooks, all of Towner Co., N. D. Together they bought 220 acres of land March 18, and will help to make Kerman the richest colony in California.

Do You Know

That the east is burning up with land hunger? That productive lands are getting scarce and hence higher? Do you know that the people east are just beginning to find out that there are agricultural lands in California and hence that we are on the eve of the greatest emigration movement California has ever experienced.

Do You Know

That as a consequence it behooves all who are landless in California but who hope sometime to enjoy the blessings of a landed home, to get busy and to secure the home before the other fellow gets it, and before prices have advanced to where they are prohibitive? That the easterners who are coming here now are astounded with the agricultural possibilities of "New California?" That they are buying themselves, and then going back home spreading the news of their find, and inducing others to come?

Do You Know

That ere long the man who owns productive land here will discover its value, and will refuse to part with it at several times the amount it now takes to "lift" it, and that when that time comes it will be everlastingly too late for many.

Do You Know

That the value of land depends upon what it will produce per acre? That land on the **Kerman Tract** is today the cheapest land in the United States, value of possible products considered? That this fact is becoming known, and that it is bringing more people here than have ever come to any other similar tract in the same length of time?

Do You Know

That the **Kerman Tract** excels when it comes to water right, quality and lay of soil, natural drainage, location, and in possibilities for fruit and alfalfa growing, dairying and poultry raising? That it is unsurpassed, if equalled, in the things that go to both home and money making? That it is being populated by the very best quality of people, the cream of the country? That undesirable people are not allowed to buy land here and that those who locate are protected against the scourge which has ruined so many otherwise promising colonies in California? If you do not know these things now

We Are Telling You

And we ask the privilege of further informing you. If you are interested we would like nothing better than the chance to satisfy you upon all these points, either by correspondence or by showing you over the tract. We consider it a pleasure to show interested visitors over the colony, and all comers are accorded courteous and considerate treatment. Our circular explains in detail what is here, and it is free for the asking. Write for it, and do it now. But, what is better, come here and satisfy yourself that the **Kerman Tract** is as represented, and that you are not missing something that cannot be retrieved by not taking advantage of this opportunity now. Making Irrigation Ditches by Machinery on the KERMAN TRACT

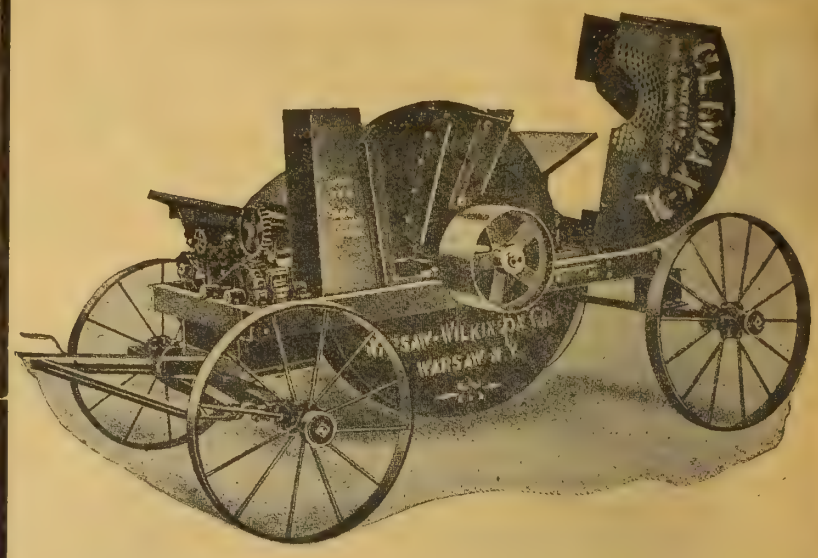
On this tract, and in two months, over 6,000 acres of new land was put under water, and into fruit, vines and alfalfa.

Climax Ensilage Cutters



In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequaled in simplicity, strength, durability, convenience and safety in operation, and the excellent quality and uniformity of the silage. We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 15 to 25 tons of green corn per hour, where cut in one-half lengths, other feed in proportion. For further particulars, call on or address

Forestry in the United States

Practical Ideas on the Preservation of Our Natural Resources by Gifford Pinchot, Forester of the U. S. Department of Agriculture

THE FORESTS of the United States cover an area of about 699,500,000 acres; or more than 35 per cent of the surface of the country. Before so large a part of them was destroyed they were perhaps the richest on the earth, and with proper care they are capable of being so again. Their power of reproduction is exceedingly good.

In the Northeastern States, and as far west as Minnesota, once stretched the great white pine forest from which, since settlement began, the greater part of our lumber has come. South of it, in a broad belt along the Atlantic and the Gulf coasts, lies the southern pine forest, whose most important tree both for lumber and naval stores is the southern yellow pine. In the Mississippi Valley lies the interior hardwood forest of oaks, hickories, ashes, gums, and other hardwood trees. It is bordered on the west by the plains, which cover the eastern slope of the continental divide until they meet the evergreen Rocky Mountain forest, which clothes the slopes of this great range from the Canadian line to Mexico. Separated from the Rocky Mountain forest by the interior deserts, the Pacific Coast forest covers the flanks of the Sierras, the Cascades, and the Coast ranges. Its largest trees are the giant sequoia and the great coast redwood, and its most important timber is the fir.

The forests of the Philippine Islands cover an area of more than 40,000,000 acres. Their timbers, almost wholly different from those of the United States, are exceedingly valuable, both as cabinet woods and as construction timber. An efficient forest service was organized in 1898, and following its reorganization in 1902 a new and excellent forest law was passed in 1904. The Philippine forest service costs but half as much as the revenue from the forests of the islands.

The island of Porto Rico contains a national forest reserve, the site of which was once covered with valuable hardwoods; but this forest has been much abused. Porto Rico, like the Philippines, has many kinds of wood valuable for cabinet making.

The Settler And The Forest.

When the early settlers from the Old World landed on the Atlantic coast of North America they brought with them traditions of respect for the forest created by generations of forest protection at home. The country to which they came was covered, for the most part, with dense forests. There was so little open land that ground had to be cleared for the plow. It is true that the forest gave the pioneers shelter and fuel, and game for food, but it was often filled with hostile Indians, it hemmed them in on every side, and immense labor was required to win from it the soil in which to raise their necessary crops. Naturally, it seemed to them an enemy rather than a friend. Their respect for it dwindled and disappeared, and its place was taken by hate and fear.

The feeling of hostility to the forest which grew up among the early settlers continued and increased among their descendants long after all reason for it had disappeared. But even in the early days far-sighted men began to consider the safety of the forest. In 1653 the authorities of Charlestown, in Massachusetts, forbade the cutting of timber on the town lands without permission from the selectmen, and in 1689 the neighboring town of Malden fixed a penalty of 5 shillings for cutting trees less than 1 foot in diameter for fuel. An ordinance of William Penn, made in 1681 required that 1 acre of land be left covered with trees for every five acres cleared. But these measures were not well followed up, and the needless destruction of the forest went steadily on.

First Steps In Forestry.

More than a hundred years later, in 1795, a committee of the Society for the Promotion of Agriculture, Arts, and Manufactures in New York made a report on the best way to preserve and increase the growth of timber. Four years afterwards Congress appropriated $200,000 for the purchase and preservation of timberlands to supply ship timbers for the navy, and in 1822, with the same object in view, it authorized the President to employ the army and navy to protect and preserve the live oak and red cedar timber of the Government in Florida. Since that time more and more attention has been given to the forests. In 1828 Governor De Witt Clinton, of New York, spoke of the reproduction of our woods as an object of primary importance, and in the same year the Government began an attempt to cultivate live oak in the South for the use of the navy. Three years later an act was passed which is still almost the only protection for the much-abused forests of the public domain.

In 1872 the Yellowstone National Park was established, and in 1873 Congress passed the timber-culture act, which gave Government land in the treeless regions to whoever would plant one-fourth of his claim with trees. In 1875, the American Forestry Association was formed in Chicago through the efforts of Dr. John A. Warder, who was one of the first men to agitate forest questions in the United States. In the centennial year (1876) Dr. Franklin B. Hough, perhaps the foremost pioneer of forestry in America, was appointed special agent in the Department of Agriculture. This was the beginning of educational work in forestry at Washington. Soon afterwards Congress began to make appropriations to protect the public timber, but nothing was done to introduce conservative forest management.

About this time forest associations began to be established in the different States, the most influential and effective of which has been that in Pennsylvania. The States also began to form forest boards or commissions of their own.

In 1888 the first forest bill was introduced in Congress. It failed to pass, but in 1891 an act was passed which was the first step toward a true policy for the forests of the nation. The first step toward national forestry is control of the national forests. This act, whose chief purpose was to repeal the timber-culture act, contained a clause which authorized the President to reserve timber lands on the public domain, and so prevent them from passing out of the possession of the Government.

The Public Domain.

In all the States and Territories west of the Mississippi except Texas, and in Ohio, Indiana, Illinois, Michigan, Wisconsin, Florida, Alabama, and Mississippi, all the land originally belonged to the Government. This was the public domain. It has gradually been sold or given away until in many of the States it has all or nearly all passed to other owners. But it still includes more than 470,000,000 acres, or nearly one-third of the United States, not including the Territory of Alaska, which has an area of about 350,000,000 acres. A large part of the public domain has been surveyed by the Government and divided first into squares 6 miles on each side, called townships, then into squares of one mile, called sections, and these again into quarter sections and smaller divisions. The lines which mark these divisions are straight and at right angles to each other. When any part of the public domain is reserved or disposed of it is usually located by reference to these lines.

Federal Forest Reserves.

When power was given the President to make forest reserves, the public domain still contained much of the best timber in the West, but it was passing rapidly into private hands. Acting upon the wise principle that forests whose preservation is necessary for the general welfare should remain in Government control, President Harrison created the first forest reserves. President Cleveland followed his example. But there was yet no systematic plan for the making or management of the reserves, which at the time were altogether without protection by the Government. Toward the end of President Cleveland's second administration, therefore, the National Academy of Sciences was asked to appoint a commission to examine the national forest lands and report a plan for their control. The academy did so, and upon the recommendation of the National Forest Commission so appointed, President Cleveland doubled the reserve area by setting aside 13 additional forest reserves on Washington's Birthday, 1897.

The Cleveland forest reserves awakened at once great opposition, and led to a general discussion of the forest policy. But after several years of controversy widespread approval took the place of opposition, and at present the value of the forest reserves is generally recognized.

The recommendations of the National Forest Commission for the management of the forest reserves were not acted upon by Congress, but the law of June 4, 1897, gave the Secretary of the Interior authority to protect the reserves and make them useful. The passage of this law was the first step toward a national forest service. The second step was the act of Congress, approved February 1, 1905, which transferred the control of the national forest reserves from the Department of the Interior to the Department of Agricluture. This act consolidated the Government's forest work, which had been divided between the General Land Office and the Bureau of Forestry, and secured for the reserves the supervision of trained foresters.

President McKinley and after him President Roosevelt continued to make forest reserves. The latter introduced a system of examining the proposed forest reserves, so that now their boundaries are better located than ever before. Un-

With the Citrus Growers

SOME DISEASES OF THE CITRUS.

FROM the Report of the Florida Experiment Station we note the following regarding citrus diseases :

Smoky Fungus.

The smoky appearance of the orange caused by this fungus is not to be confused with the blackening due to the sooty mold which accompanies the whitefly. The smoky fungus causes no noticeable injury to the fruit itself. It does, however, mask the bright color of the fruit by a layer of dark-colored, mycelial threads, which spread over the surface of the rind. It may be rubbed off with the fingers, and so is attributed by some growers to the accumulation of dust particles from the air. It is most apt to occur in moist groves, late in the fall, and on oranges that have remained on the tree after they are ripe. The selling quality of the fruit is naturally somewhat impaired by the presence of this fungus.

Remedies.

The smokiness may be readily removed from the fruit by putting it through a washer like those used for freeing fruit from the sooty mold fungus. (2) In the course of our investigations on the scaly bark disease it was noticed incidentally that Bordeaux mixture was effective in preventing the appearance of the smoky fungus, if applied at the proper time of the year. One spraying about the first of October kept off the smoky fungus and did not cause sufficient increase in scale insects to injure the appearance of the fruit. Two or three sprayings, however, during the summer, caused such an increase in the number of scale insects as to materially injure the fruit, leaves and small branches. This increase in scale insects was due to the Bordeaux mixture having killed the fungi that were parasitic upon them, thus giving them immunity from their fungus enemies. When spraying to prevent attacks of smoky fungus it may be suggested that the solution should be applied, as far as possible, only to the fruit. The spray should be kept away from the larger limbs and the trunk, where the beneficial fungi are usually located in considerable abundance. A weak solution, consisting of 3 pounds of quicklime, and 3 pounds of copper sulphate to 50 gallons of water may be used. (See Bul. 76, Fla. Agr. Exp. Sta.)

Withertip.

This disease has been quite severe on citrus trees in some parts of the state. Last November it occurred in a number of groves near DeLand, causing much damage. It killed back twigs and limbs even in otherwise healthy and well-kept groves. It was noticed, in some cases, that the damage done by withertip became evident after several weeks of dry weather following a period of moist weather. It was also noticed that in a neighborhood where groves were close together, the disease would frequently be severe in one grove, while at the same time a neighboring grove would remain free from it. Within the same grove also there were individual trees and individual limbs of a tree that were attacked, while other trees of the grove and other limbs of the diseased tree remained uninjured. The difference in the action of the fungus toward different limbs of the same tree is probably due to a difference in the vitality of the individual limbs. Any cause rendering a branch somewhat weak, such as a previous heavy load of fruit, would most probably render that branch susceptible to an attack of the fungus. The same would doubtless be true in regard to the susceptibility or immunity to the disease of the different trees in a grove. Cases occur that can be accounted for by considering trees as individuals, each slightly different from the other. One tree apparently just as healthy as another is, for some cause not yet understood, less resistant to this particular disease, and is therefore attacked, while the tree next to it may remain uninjured.

Treatment.

(1) In all cases where it is possible, the diseased limbs should be pruned out. This should be done by cutting across the limbs some distance below the diseased part. The limb will usually be affected for some space below any visible injury, and care should be taken to cut far enough back into what appears to be healthy tissue to get out all of the wood into which the fungus has entered.

(2) Where the disease appears only on the fruit and leaves, Bordeaux mixture has been found to be an effective check on its spread. The use of Bordeaux mixture should be avoided, however, unless the disease becomes very severe. The objection against the use of this fungicide is that it allows an increase of scale insects by killing off the fungi that are parasitic upon them. Whenever it becomes necessary to resort to Bordeaux mixture for the cure of this disease, it should be applied as far as possible only to the diseased fruit and leaves, so as to avoid killing the beneficial fungi on the larger limbs and trunk.

Gumming.

The gumming disease of citrus trees continued to do much damage during the past year. The gumming areas are usually on the trunk and larger limbs at a considerable distance from the foot of the tree. This point of difference, as was mentioned in last year's report, distinguishes the disease from foot-rot. An effective remedy for this disease has not yet been found. Cutting out the affected areas and treating the wounds with carbolineum or other disinfectant is recommended by some growers.

Scab.

This disease was reported from several localities as occurring on grapefruit and lemons. It causes the leaves to become contorted and curled, with the production of wart-like elevations, or raised scabby areas of irregular size and shape. It is almost always to be found on sour orange and lemon trees in every citrus-growing section of the state. Only in the early part of the year, when conditions of moisture and growth become favorable, does it break out upon the grapefruit, Satsuma, and in rare instances, upon the sweet orange.

Treatment.

Sometimes the disease breaks out

early in the year, on quite young leaves and fruit, in a very severe form. The only known preventive of its spread is Bordeaux mixture, applied early in the year. The same care should be used in applying the Bordeaux so as to avoid killing the beneficial fungi, as when spraying to cure withertip.

SOIL TEXTURE.

A horse blanket is coarser than a baby's undershirt, and a gunny sack coarser than a silk handkerchief because of the difference in texture, not only of material but method of weaving.

One soil is fine grained and readily packs, while another is fine grained and will not pack. On the other hand one soil is coarse and lumpy and another is coarse but not lumpy. It is all due to a difference in texture.

Suppose you have a farm that is a heavy clay. The plow may or may not scour, but the furrow rolls up in great clods of packed soil instead of crumbling as it falls from the mold-board. That soil has a fine grain and the grains adhere. Just the thing for making mud pies—or maybe brick or tile. In order to plow such land and get a decent seedbed without excessive work you have to wait until very late in the spring before plowing. It does fairly well then but not as it should.

Plants get their water—and the mineral elements dissolved in the water—from the soil by means of root-hairs, and these only. These root-hairs are very delicate and it is readily seen that they cannot penetrate a clay ball wet or dry. They work their way in between the soil grains and absorb the thin filaments of water surrounding each grain.

Soil texture is of great importance in aiding or hindering plant feeding. It is folly to begin plowing so early that the soil turns up lumpy. It presses the soil grains closely together and they stick. It may take all summer or even a year to disintegrate these lumps again so the plant food becomes available.

Just a day or so delay often makes a field dry enough to plow right. But delay is often a great set-back to farm operations. If a soil is inclined to be heavy it needs something that will change its texture. An application of lime causes a heavy soil to become more crumbly because it prevents packing.

When a soil gets deficient in humus —dead plant matter—it becomes sticky and heavy. To restore such soils to proper texture humus must be added. This can be done by growing the legumes, for they have a great root system that penetrates deeply. The decayed roots benefit the texture of the soil. Plowing under stubble and cornstalks, weeds, etc., instead of burning manure does the same thing. All these assist good tillage in restoring a wornout soil to its proper texture. Crop rotation is imperative.—Successful Farming.

ADVERTISING ORANGES.

Speaking of advertising oranges the Riverside Press refers to one company which has a method of its own as follows:

The Orange Growers' Cash Association of Redlands have been advertising their product in an original manner and the results attained by them are also satisfactory. This concern makes a specialty of careful and correct handling and all of their best oranges are packed under the Elephant brand and each individual orange is labelled with a small tag, the Elephant in green and gold. This concern has concentrated its efforts on New York City and New England. Their idea is to put up a good orange in the first place and then to so distinguish that orange that the pleased consumer will call for the same brand again. They further assist the retailer by sending in every box a line of display cards and advertising talks that is aimed to help him get rid of his goods quickly and in turn he is expected to so appreciate this help that he will again be in the market for the Elephants.

Deciduous Fruit Culture

By J. W. Mills

APPLES.

THE state of maturity at which apples can best be picked depends upon the varieties and the purposes for which they are intended. Summer varieties, for home use or for the local market, need not be gathered until fully ripe. Fall and winter fruit, intended for the same use, may be allowed to fully ripen, but should be picked before the mellowing process begins. Summer, fall and winter varieties, for long-distance shipment or for storage, should be gathered as soon as fully grown and colored. The best time for harvesting each variety can only be determined by experience. Successful growers study their own local conditions and observe the experience of others having similar environments.

In gathering apples, either for market, storage or home purposes, it is necessary to remove the fruit from the tree with a great amount of care. This work should always be done by hand, and not in the careless, wholesale way of shaking, beating or knocking the specimens off with clubs or poles. This latter method invariably results in bruising and snagging the fruit, thereby damaging its keeping qualities and destroying its general attractiveness. Growers need not expect profitable prices for their apples if treated in this manner. Each specimen should be firmly grasped in the hand and, with a slight twist, the stem separated from the twig or branch. The stems should remain in the fruit. Their removal leaves an opening in the flesh of the fruit, in which decay is apt to develop. As each apple is removed, it is placed in either a basket or sack, arranged to suit the convenience of the picker. The inside is frequently padded to lessen the liability of bruising. A piece of iron rod bent in the shape of the letter S makes a good hook with which to suspend the basket from either a limb or the rung of a ladder while picking. A convenient way to use a sack is to put a small stone or piece of corncob in one corner of the bottom and tie a rope or strap around this; then, in the same way, tie one side of the mouth of the sack with the other end of the rope or strap, thus making the sack into a loop, that can be thrown around the neck and suspended from the shoulder of the picker. The mouth of the sack is brought to the front and is held open by means of a stout, bent wire placed under the hem. The fruit is picked either from the ground or from stepladders, or other light ladders that can be carefully laid against the limbs or branches of the trees. Ladders should not be thrown on or against the limbs, as this damages both the fruit and the tree. With low-headed trees, a large percentage of the fruit can be harvested from the ground, thus saving not only time but labor.

Apples can be graded and packed at the same time. This may be done either in the orchard or the packing shed, or the storage house, as best suits the convenience of the grower. The main point to be observed is to handle the fruit carefully. Apples are usually divided or sorted into three grades, "firsts," "seconds" and "culls." First-grade specimens must be uniform in color, size and degree of ripeness. They should also be entirely free from insect injuries, the marks of disease, bruises, or any other defacements or blemishes. When fruits answering these requirements are well packed in suitable packages and placed on sale they never have to go begging for a purchaser. Second-grade fruit should also have a certain degree of uniformity regarding size, color and ripeness, and should not be noticeably marked by insect or fungous injury, nor by bruises or other blemishes. Fruits of this grade, when carefully packed, often sell for a good price. "Culls" are those specimens that fail to answer all the requirements of either of the other two grades. Unless there is an unusually strong demand on the market, fruit of this kind had best be kept at home. "Culls" or inferior apples, when mixed with good specimens, damage and almost always ruin the sale of the fruit.

Next to grading, the packing of apples is the most important operation connected with their production and sale. Within recent years, the more progressive growers have been packing their choice, fancy grade apples in boxes. The average uniform box contains approximately one bushel. The fruit is wrapped in attractively labeled paper and packed in layers. During the past season, No. 1 New York State apples sold at $4 per barrel. "Fancy" grade stock of the same variety at the same time brought $4 per box. Most of the apples from the western states are placed on the eastern markets in boxes.—B. S. Shaw of North Carolina Dept. of Agriculture.

NUT PASTES AND NUT PRESERVES.

Pastes which are used by confectioners for candy making and in other ways are made from nuts with the addition of sugar. Sometimes water and starch are added, but such admixtures are inferior to the nut and sugar pastes. The most common material of this sort is the almond paste, which is manufactured in large quantities in the United States and is also imported. It is used for making cakes, candies, etc., the highly ornamented cakes called "marzipan," so popular with the Germans, being one of the very well-known almond-paste confections.

Macaroons are also well-known cakes made from ground almonds or almond paste. Cocoanut is also used for the same sort of cakes.

Chestnuts preserved or candied in sirup and then dried, the marrons glace of the confectioners, are esteemed a delicacy and are eaten alone or are used in confectionery, etc. Thus prepared they are a common commercial article. Much less common are the English walnut meats preserved in sirup, which are manufactured in Europe and exported to this country in limited quantities. Preserved nuts which are similar to these are made in this country, particularly for the soda-water trade. Often maple sirup is used instead of ordinary sirup. Nut sirups, in which the ground nuts are incorporated with the sirup, are also well known for the same purpose, and are quite similar to the nut bisques or similar

Easy as Roller Bearings

There's an Axle lubricant so full of *slip*, and *go*, and *smoothness*, that it takes the place of roller bearings for all kinds of horse-drawn vehicles. It's

MICA AXLE GREASE

And a trial of it means constant use ever after. Mica Axle Grease *won't* make an empty wagon *push* a horse up hill; but it *will* make a big load draw no end of per cent easier.

pudding sauces made at home, and all such nut preserves are rich in carbohydrates, owing to the added sugar. In Germany walnut meats and spice are often added to the plum butter which is made in such quantities in many homes. In the Tropics a thick, sweet preserve is made from cocoanut and sugar which is much liked locally, though those who are not familiar with it consider it very sweet and insipid. The Turks make several products from walnut meats and grape juice which are considered wholesome and palatable foods. In one of these the nuts are strung on a strong thread and dipped in thickened grape juice until well coated with it.

A VALUABLE FOOD.

Nuts are a very concentrated food, even more so than cheese, but when rationally used they are well assimilated and may form a part of a well-balanced diet. Nuts are a very valuable source of protein and fat, these two nutrients being the characteristic constituents of the more common nuts, of which the walnut and cocoanut may be taken as types. In nuts like the chestnut, carbohydrates are a characteristic constituent. For most families it is undoubtedly wiser to use nuts as part of the regular diet than as a condiment or supplement to an otherwise hearty meal.

Vegetarians and others who use nuts in place of meat should not depend upon them as the main food supply, but should supplement them with more bulky foods with a low content of protein and fat. As a whole, nuts may be classed among the staple foods and not simply as food accessories. At usual prices, nuts are reasonable sources of protein and energy. Peanuts supply protein and energy very cheaply, even compared with such staple foods as bread and beans. There are a number of nut foods on the market, but it may be stated that there is little to be gained from the standpoint of food value or economy in their use in place of the ordinary nuts and home-made nut products, especially by healthy persons who are willing to masticate their food thoroughly and to use nuts in reasonable combinations Unless something has been added, the nutritive materials in such special preparations can not be greater than the nuts from which they are made, though in the mechanical condition or in some other way the foods may be better fitted for ready assimilation. Furthermore, nut butters and similar foods give a pleasant variety to the diet, and they are relished by many who would not care for the unprepared nuts.

Though less subject to contamination than many other foods, nuts should be handled and stored under good conditions, and especially should be protected from dampness and insect enemies.—Prof. M. E. Jaffa.

Local Union at Selma is arranging for a packing house to handle the coming season's output of dried fruit. It is expected that the start on shipping green grapes will be made in Fresno about the fifteenth of July. It is thought the output will be nearly 1500 cars or nearly twice that of last year.

Fruit growers of British Columbia have been troubled with curl leaf and other diseases which have been caused by the cold late spring, so that they will be compelled to suffer great loss on this year's output.

UNFERMENTED GRAPE JUICE.

UNFERMENTED grape juice has no doubt been used ever since wine has been made from the grape, declares an exchange. The industry of manufacturing unfermented grape juice on an extensive scale for a general market is, however, as yet in its infancy. The Greeks had two kinds of wines, the protoplon, or first juice of the grape before pressing, and the denterion, or pressed juice. The Romans called them vinum promarium and vinum secondarium. Some of them drank the juice before fermentation had started and called it mustum; after the must had been through a heating process they called it frutum, and when after a long heating it had been reduced to one-third, or one-half its original volume, they called it sapa. This was used by the Romans on their bread and was the equivalent of what we now call syrup.

In Europe physicians often send their patients to the wine growing districts, during the vintage time, to take daily rations of must as it comes from the crusher. This, however, restricts its use to only one season in the year, and to the immediate vicinity of wine districts, or to individuals strong enough to make the journey. Of late years extended efforts have been made to keep the must unfermented and to put it up in such shape that it can be used anywhere and at all times of the year.

Until recently its use has been almost exclusively restricted to medicinal purposes. It is well known that pure must is healthful and nutritious. Grapes contain from 15 to 35 per cent sugar; about 2 to 3 per cent of nitrogenous substances, and some tartaric and malic acids. The skins contain tannin, cream of tartar and coloring matter. The seeds contain tannin, starchy matter and fat. The stems contain tannin, divers acids and mucilaginous matter. The comparative composition of the different parts of the fruit determines the value of must made from the fruit.

The uses of unfermented grape juice are many. It is used in sickness, convalescence and good health; as a preventive, restorative and cure; by the young, persons in the prime of life, and by those in old age; for sacramental purposes and at soda fountains; and in the home as a beverage, as a dessert and many other ways.—Exchange.

JAPANESE PERSIMMON.

The Japanese persimmon is now widely cultivated to a greater or less extent throughout most of the Southern United States and in parts of California. In the Southern States the area adapted to its culture corresponds in a certain measure with the cotton belt. It cannot be grown successfully north of Washington, although it has been fruited in New Jersey, and the northern limit of profitable culture is considerably south of the District of Columbia. The leading states are California, Tennessee and the Gulf States. In Texas there are several large orchards, but so far as known to the writers, the largest single orchard in the country is that owned by Mr. William Macklin of Dinsmore, Fla., who has between two and three thousand trees. Florida probably has the largest acreage of any state in the Union, but the total acreage has not yet been definitely ascertained.

The best soil for the Japanese persimmon is one of rather open texture containing a fair amount of humus and having good drainage. Regarding the soil conditions in Japan, the Japan Agricultural Society makes this statement: "The soil most adapted to the plantation of the Kaki is the gravelly clay loam in a situation neither too dry nor too damp. A free open space is necessary.

Distances.

The Japan persimmon may be divided into two groups, based upon the habit of the growth of the trees. Some varieties, Costata for instance, are strict and upright in habit, and consequently require less space than varieties of more or less spreading habit like Triumph and Hachiya. However, this difference in habit of growth need hardly be taken into consideration in discussing the question of distances. As a general thing, 15 to 20 feet distance will be about right.

How few persons consider, as they hold a luscious bunch of grapes in their hands, the amount of patience and expense it may have cost the producer to obtain the original vine. Thousands upon thousands of hybridized vines have gone into the flames as unworthy, and all this waste only adds to the labor and cost of those to be saved. Yet this selfish world cares little who has done this great labor to attain the end, if the fruit be but good. And consequently, there being but fame for compensation, only an enthusiastic student will continue in the work and grow old in the harness with ever renewing ardor as his experiences grow and theories expand.

The Brookings Lumber Co., having large holdings near Fredalba, San Bernardino county, is planning for extensive reforestration by planting large nurseries. Amongst the varieties of forest trees which will be tried, are, ash, hickory, silver maple, poplar, walnut, dog-wood and locust.

LIFE HISTORY OF THE CATTLE TICK.

An intimate knowledge of the life history of the cattle tick is necessary to those who have the pest to contend with in order that they may wage their battle more intelligently and at the same time secure better and greater results. A knowledge of the manner in which the tick propagates can not fail to be of value in the war of extermination now being carried on against it in the South.

Only a part of the development of the tick takes place on the host (animal), while the remainder occurs in the pasture. The female tick, which is attached to the skin of the host, increases enormously in size as a result of drawing liberal quantities of blood, and when fully engorged drops to the ground, where she at once begins to search for a suitable hiding place that will serve as a protection from the sun and enemies. The female ticks may be devoured by birds, destroyed by ants, or may perish as the result of unfavorable conditions, such as, for example, low temperature, lack of moisture, etc., so that many may be destroyed without having laid any eggs.

Egg-laying begins during the spring, summer, and fall months in 2 to 20 days and during the winter months in 13 to 98 days. The eggs are small, elliptical-shaped bodies, of a light amber color that later changes to dark brown, one-fiftieth of an inch in length, coated with a sticky secretion that causes them to adhere in clusters and keeps them from drying out. During egg-laying the tick gradually shrinks to about one-third or one-fourth her former size. The egg-laying period continues for from four days in the summer to 151 days beginning in the fall, and during this period from several hundred to 5,000 eggs may be deposited. The mother tick then dies within a few days.

In from 19 days (in summer) to 188 days (in fall or winter) after the eggs have been deposited they begin to hatch. From each one issues a small, oval, six-legged seed tick, at first amber colored, later changing to a rich brown. After crawling slowly about the shell it usually remains quiescent for several days; then it displays great activity, especially if the weather is warm, and ascends the nearest bit of vegetation, such as grass, herbs, or shrubs.

Since each female lays her eggs at one spot, thousands of newly hatched ticks or larvae will appear at the same place and later will ascend nearby grass stems and collect on the blades. This accounts for the brown masses of larvae observed clinging to vegetation in pastures or on fence posts. This upward instinct of the ticks increases their chances of reaching a host, for when the vegetation is disturbed they become very active, extending their long legs violently upward in an attempt to seize hold of a host.

During its life in the pasture the seed tick takes no food and hence does not increase in size, and unless it reaches a host it dies of starvation. This fact is significant and is taken advantage of in the work of exterminating the ticks. Their endurance, however, is very great, and under certain conditions they have been found to live without nourishment nearly eight months during the colder part of the year.

The length of the period from the time females drop until all the seed ticks hatching from the eggs laid by them are dead, or in other words, the time required for pastures to become free of ticks after all cattle, horses, and mules have been excluded, varies with the season of the year, being shortest during the warm part of the year and longest during the cold part of the year. For example, all the seed ticks resulting from females dropped June 15 will be dead by November 1, a period of four and one-half months; but some of those resulting from females dropped September 1, may survive until the following July, a period of ten months.

Another phase of development begins when the tick reaches a favorable host, such as a cow. It usually attaches itself to the skin of the escutcheon, the inside of the thighs and flanks, or to the dewlap. It at once begins to draw blood and increase in size. In a few days it changes from brown to white. In from 5 to 12 days it sheds its skin, the new form having eight instead of six legs and being known as a nymph. In another 5 to 11 days after the first molt the nymph sheds its skin and becomes sexually mature, and it is at this stage that males and females are conspicuous for the first time. The male emerges as a brown oval tick about one-tenth of an inch in length. Having reached the full measure of his growth he displays greater activity in moving about on the host. The female is slightly larger but shows much less activity, seldom moving far from her point of attachment previous to molting. After mating she increases rapidly in size, and in 21 days (in hot weather) to 66 days (in cold weather) after attaching as a seed tick she becomes fully engorged and drops to the ground to repeat the cycle of development.

Publications containing full information about ticks and giving directions for getting rid of them may be obtained free on application to the Bureau of Animal Industry, Department of Agriculture, Washington, D. C.

BABY PIGS ON THE BOTTLE.

It often happens that a sow dies and that her pigs are left as orphans. In other cases a sow will have more pigs than she has teats, hence some of them are crowded out and soon perish of hunger. The proverbial "runt" is not necessarily so from inheritance, but from lack of nourishment. The pig that must "suck the hind teat" must of necessity live on less than his more favored brothers and sisters, and hence makes slow development. Once a runt, always a

Cream Separators, all sizes, all prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

runt, is an invariable law of nature.

Many people seem wholly at loss when pigs are deprived of their mother. They believe that the little things can never be made to live, no matter what feed and care are given them. This is a mistaken notion. Little pigs can be raised as easily on the bottle, or milk in the pan, as can calves or as can young chicks in the brooder. The requirements are simple and easy.

In raising pigs by hand, place them in a warm box in a warm room, put plenty of hay or straw bedding in the box, and cover them up carefully at night so that they will not become chilled. Place the box near a stove in winter, but no artificial heat will be required in summer. They are not as tender as chicks, yet they must not become chilled for the first two or three days. During the day place their nest box where direct sunlight will shine in it, as all real young animals are very much benefited by sunshine.

Feeding young pigs is easy work and teaching them to eat is not at all difficult. For the first meal take the little porkers in your lap, one at a time, and pour a few drops of warm milk fresh from the cow down its throat with a teaspoon. In withdrawing, allow the spoon to touch the lips of the pig. This may seem a trivial point, but the second time it happens the young fellow will begin to think—perhaps—and will probably "sit up and take notice," for the best way to appeal to and win the confidence of a young animal, a child and some men is to feed them. It strikes a sympathetic and responsive chord in their natures that makes getting along with them easy, providing you keep up the feeding.

After the second feeding of the young pig with a spoon, place some warm milk in a very shallow pan or sauce dish and place its nose in the milk. The pig will suck the drops of milk from its lips, and by the next time its nose touches the milk it has learned to drink and the trouble is all over. It is not necessary to give the pig your finger. It simply learns to drink the milk, and that is the end of it. We have found that two or three lessons are sufficient.

When the pigs are about two weeks old a little cooked oatmeal or bread may be fed with the warm milk and the mixed feed increased as the pigs grow. After the pigs are two weeks old, find what they will eat and gradually give them a variety till they are ready to be turned out with the common herd.

Remember that one over feed is almost sure to result disastrously. Light feeds and often will bring success.—Journal of Agriculture.

EDUCATIONAL BUTTER SCORING CONTEST.

Interest in the butter contest seems to be growing, as more entries have been received this time than at any previous contest. The exact number is uncertain, as we have method-blanks for one or two entries that have not yet arrived. In general, the butter came in good condition and, with a few exceptions, was well packed. Several persist in sending entries in odd shape packages, when the size specified could as easily be made. Consequently their butter is at a disadvantage. One package that came is especially worthy of mention. The container was a second hand fish tub, simply washed out and lined with one layer of parchment paper. In view of the general appreciation that butter readily takes up strong odors that it comes in contact with, this incident is the more remarkable. To say that this entry was "fishy" expresses it mildly. We are glad to note greater care in filling out method blanks, as this is a great help in making criticisms.

Reference is made in this report to "whole-milk" creameries. As will be seen by the appended statement, only three whole-milk creameries appear and one of these receives some gathered-cream. The competition is really between gathered-cream creameries. The entry from one whole-milk plant had not been received at the time of preparing this report.

The quality of the butter, all lots considered, averages poorer than at the April contest, though several excellent entries were examined. The reasons for this dcline are obvious to all creamery men. The method blanks show, in some cases, that too high temperatures were used for churning and washing. Buttermakers must exercise their wits to devise means to hold the temperature down these warm months. Oily and old cream flavors were common in the lower scoring entries.

As concerns starters, there is encouragement. At least 17 out of 27 entries were made by their use. The amount varied from 8 per cent to 50 per cent, with an average of 16 per cent. The number of contestants employing starters in their work seems to be on the increase. The butter that scored highest was made from 32 per cent cream, one day old, ripened to 5 per cent acidity and cooled to 50 degrees F. Ten per cent of starter was used. The three highest scores went to butter made from cream ripened with starter. Those using artificial culture will do well to secure some for it from their nearest supply house. An order for a starter-can, if it is properly used, will go a long way toward improving the quality of future entries. Individual letters of criticism will be sent to each contestant. All California creamery men not already competing, who desire to enter the next contest, which will come in August, should address the undersigned in time to receive instructions.

The list of creameries scoring 90 or above, as placed by Mr. Mitchel and members of the dairy department, is as follows:

Name of Creamery.	Score.
Colusa Butter Co., Colusa	95
Castroville Creamery Co., Castro.	94½
Gridley Creamery, Gridley	94
Pozzi Creamery, Meridian	93½

Which For You?

These pictures tell their own story. The upper picture shows **all there is to the simple, sanitary Sharples Dairy Tubular Cream Separator bowl.** In the young woman's right hand is the body of the bowl—smooth inside and out. On the little finger of her left hand is the **only** piece used inside the bowl. In the same hand she holds the lower end of the bowl. The entire Dairy Tubular bowl is easily cleaned in 1 to 3 minutes.

The lower picture shows 52 disks used inside one of the many "bucket bowl" machines which disgusted farmers and their overworked wives are discarding for Tubulars. The maker attempts to sell it by saying it can be "washed as one piece." Tubular popularity has greatly decreased his sales, and he has commenced infringement suits against a catalog house and others who have been selling cheap separators, with disks like his, for a number of years.

Which separator for you? The Tubular, of course. Made in the world's greatest separator factory—branch factories in Canada and Germany. 1909 sales exceed most, if not all, others combined. Write for catalog No. 260.

Small Fruits and Vegetables

CALIFORNIA BERRIES.

HALF a million dollars is the estimate of revenue which the strawberries produced in the country within a few miles of Los Angeles will yield this season. The berries are now returning to their growers between $5000 and $7000 per day. The season will run three and one-half months.

From a few acres planted for commercial purposes about twelve years ago, the industry has grown to one of the largest of its kind in Southern California. There are about 2500 acres under strawberry cultivation. The largest area in any district is found at Gardena, where 900 acres are devoted to the raising of the delectable berry. Other large fields are under cultivation at Tropico, Glendale, Irwindale and Strawberry Park.

Until last year large shipments of berries to far distant cities was practically unknown. When the season opened last year and the canneries refused to take the berries grown an outlet of some sort was necessary, and one of the berry dealers struck upon the plan of shipping the fruit in car load lots. As a result about thirty cars of berries were sent out of this territory last year. About 60 cars will be shipped this season, shipments continuing until about August 1.

Up to the present, many carloads of strawberries have left Los Angeles this season. Some of them have gone as far as Chicago. When received there the fruit was reported to be in excellent condition and worth 10 cents a basket or about $1500 for a whole carload. Seattle has received several cars of Los Angeles berries this season, and they have all been shipped through in a good state of preservation. Other cars have gone to Spokane, Portland, Salt Lake City, Goldfield and the majority to San Francisco, which territory depends on Los Angeles for its berry supply.

These shipments do not nearly constitute the crop grown here. The receipts of berries on the public market every day average 4000 crates, from five to six carloads. In addition to this, the canneries of Southern California will consume a great portion of the crop. California Fruit Canners' Association has a standing order with the growers for 1000 tons of berries to be delivered within the next two months.—Exchange.

SORTING OVER THE STRAWBERRIES.

There are many fruit farms on which the strawberries are never sorted. They are picked into baskets in the field and at once placed in crates and are sent to the storage house for shipment for sale the next morning without further handling. On other fruit farms every quart of berries is turned out upon a table and sorted into two grades, the first consisting of the large perfect berries, the remainder consisting of the smaller and imperfect berries. While it may cost from one-half to one cent per box to do this sorting, it is in most markets found profitable, the large, first-class berries selling for an extra price when sorted, and the smaller berries finding a ready sale at a slightly reduced price. Whether or not it would pay you to sort your strawberries depends on your market. If your patrons do not appreciate the fancy fruit it would not pay to sort the berries.—Greens Fruit Grower.

HOW TO GROW SEA-KALE.

Sea-Kale is often spoken of as early asparagus because it is cooked and served in the same way, and has an asparagus-like flavor. The young shoots, which are very tender, require little cooking, about twenty minutes being sufficient, but care must be taken that the water does not stop boiling after the kale is dropped into the pot, otherwise the stalks will be tough.

After cooking, lift the kale from the pot, and serve either with or without toast and with drawn butter or Hollandaise sauce.

It must be eaten while hot, and while freshly cooked, as warming up simply ruins the quality.

I sow the seed in the ground about April 1st, sowing very thickly as it is large and soft and liable to rot, but as the seed is cheap you can afford to be liberal. One ounce of seed will give about 300 plants which if well grown would cost about $20.

The seed is slow to germinate, and the anxious gardener must not hoe the ground if it is not "up" as soon as the peas. The young plants, which closely resemble young cabbage, must be thinned as soon as they are well up in the row. This can safely be done when the plants are about four inches high.

During summer a rank, heavy growth is made, and by fall the very thick leaves of a glaucuos, succulent appearance will easily measure two feet from the crown.

Therefore, the plants must be given, while thinning, a foot of space each way. They will not then require any further attention until the fall, except for an occasional cultivation. I have never known sea-kale to be troubled with insects or disease of any kind.

In the fall the leaves will turn yellow and ripen, after which the roots may be left where they are forcing, or they may be left where they are grown. In the latter case they must be well covered.

The best plan to follow when the roots are to be forced is to lift them, strip off all the leaves and store in trenches covered with hay or leaves.

They must not be allowed to become dry, or they will lose their vitality; on the other hand if kept too moist, they will rot.

Give the roots a thorough soaking with water after planting. There must be enough moisture at all times to supply the growing plants.

Keep the eye or crown just above the surface when planting, because it will rot if buried.

To blanch, inverted flower pots must be immediately placed over the roots to keep them perfectly dark at all times, and it is best to cover the hole in the bottom of the pot.

The greater the darkness the better the shoots will blanch and the more blanched the better the quality on the table.

This sounds quite complicated, but, really, the operation is quite simple. Care is needed about moisture, to provide enough at all times, yet guarding against an over-supply.—Farm World.

Give growing beets clean and thorough cultivation, and thin the plants to stand four to six inches in the row. The thinning may be delayed in the home vegetable garden till the young beets are large enough to use, and thus the thinnings will not be wasted. In the truck garden the thinnings may be fed to cows, calves and pigs to good advantage.

Bees and Their Care

By Henry E. Horn, Riverside

HONEY.

When that cattle man of old, Abraham of Ur, was divinely commanded to leave his home and kinsfolk on the plains of Chaldaea and to seek a new home for himself elsewhere, he was given the promise that to him and his seed, sometime to become a great people, would be given the heritage of a goodly land; a land of hills and valleys, of brooks and rivers, a land growing the fig and the olive and the vine, "and"—as if to sum up all the pleasantness of it in just one term or two—"flowing with milk and honey." And afterwards, scattered throughout the chronicles of the fortunes and wanderings of that same man and his people there occurs time and again, the mentioning of honey, among other things, as the very ultimate of what was pleasant and delightful. Whether beekeeping as an art and industry ever developed above the primitive style now prevalent in Asia Minor after the Empire of the Jews had grown into all the splendor and glory of Solomon's reign, we have no evidence now. We only know that honey was still one among those exalted things acceptable as temple gifts.

And so in other countries.

Greece's honey of Hymettus was famous throughout the antique world. And sealed jars of honey have been found along with other precious things in the secret recesses of the temples of Egypt. And so on down the ages, honey and honey-delicacies always held a place among the things considered good and pleasant.

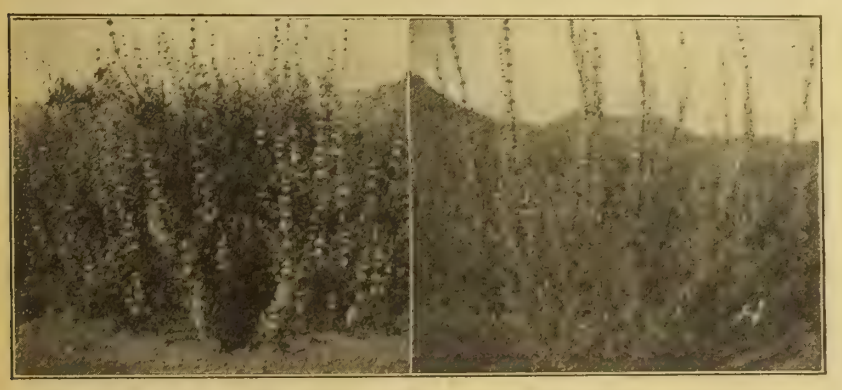
Of course, one of the reasons why honey was thus prized above rubies in all the past was that the art of extracting sugar from cane and beet was unknown then, and that, consequently, honey was the only concentrated sweet in existence But the main reason is another. There is a deep symbolism running through all nature. And the people of olden days understood this better than moderners do. To them flowers were sacred things, not so much because of their often marvelous beauty of color and form, but because of the image mirrored forth by them of a certain relationship, and although that relationship was even then, as now, often rudely profaned, the symbol was thereby not divested of its similitude to an ultimate form of it, expressed on its own plane. And as they hoped for a better age the divinely wrought perenial flower symbol was to them the sure promise of that age coming.

If a sage blossom be pulled off in the morning and squeezed between forefinger and thumb a pearly clear drop of liquid will come out, tasting sweet if touched to the tongue. That is nectar, the raw material of honey. All "herb yielding seed after its own kind" bears nectar, more or less. Those that swear by Huxley tell us that the nectar in the flowers is nothing but a cunningly offered bribe on their part to induce some winged insect to perform a certain office for them. In a fully opened five petaled orange flower the outer end of the pistil may be observed to be slightly hollowed out, and in the hollow a deposit of a creamy, sticky substance. If some pollen grains of orange happen to drop into that paste the blossom becomes fertile, and may eventually ripen into a luscious orange. If no pollen happens along the blossom drops off in a few days—a waste thing. This is particularly true of the Seedling. Lately, in Riverside, as previously in many other places, the honey bee has been outlawed—at least in a certain district. Because of some beekeepers' careless ways somebody got stung. The thing was unduly magnified, and people called out "Raus mit 'em," and 'raus' the harmless bee had to go. And now orange growers wonder why they don't get the masses of fruit any more that they used to in the past. The honey bees gather in a good season is of considerable commercial importance; but over against the other but less obvious service of fertilizing the vast stretches of field and orchard the former scarcely counts at all.

As a chemical compound honey consists of water, invert sugar, volatile oils, formic acid, pollen grains, and some other substances in minute quantities. As a food it stands alone in a class with milk and olive oil as carrying almost no waste. It is superior to milk and oil in requiring almost no digestion, it being absorbed into the blood as soon as it enters the stomach and is split up. Being a carbo-hydrate of concentrated efficacy it serves to produce that organic heat without which no life process can go on.

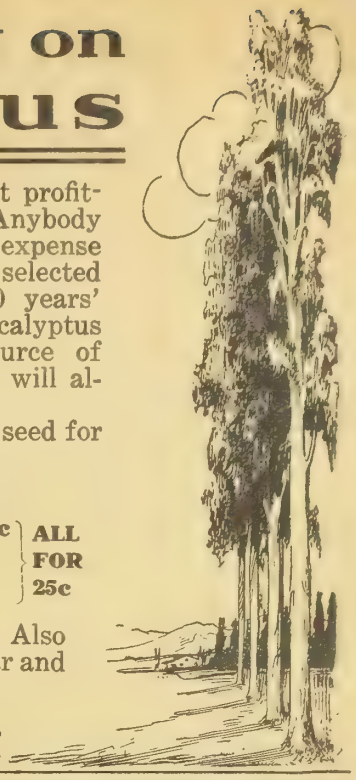
The making of honey seems a simple thing. A bee sips nectar out of a flower, goes back to the hive and pumps it out of its receptacle into a wax cell. But along with it there goes the secretion of some glands situated in the head. And it is the latter accomplishment of the honey bee that fools our industrious imitators from making honey by the vat full. Not an ounce of near-honey has ever yet been produced exactly alike to the hive product. No doubt modern chemistry can produce all the ingredients of honey synthetically, and mix them into a mass, but that would be no more honey than producing the ingredients of beefsteak in the same way would be beefsteak.

Of the half dozen distinctive varieties, the California sage honey is the most famous because of the finest quality. The honey made of the so-called "black" sage, of which picture No. 1 is an average sized bush in full bloom, is water white of color, simply delicious of flavor, and extra heavy of body. A gallon of it weighs fully 13 pounds instead of the usual 12. The "white" sage, so called for its silver white foliage—represented by photo No. 2—makes as good honey as the first, but its color is slightly amber. A five gallon can of either, known to be pure, is about as good a thing to keep in the larder as this material world affords. The orange bloom comes too early in the season to furnish much surplus for the market. Its honey is slightly amber-green, a bit scratchy, but a very good article. Buckwheat and alfalfa come amber to dark-amber, the latter a mite twangy, but a good staple.



Black Sage. White Sage.

Make Money on Eucalyptus



Growing eucalyptus is one of the most profitable industries in California today. Anybody can grow it without any culture or expense after the first year. Our seeds are selected and tested by our own expert of 20 years' local experience. A few acres of eucalyptus trees will produce an unfailing source of revenue to the owner, as the demand will always be greater than the supply.

This is the time to plant eucalyptus seed for best results.

INDEX TO VOLUME XXXII., 726, 727.

JUNE DROP.

Orange growers always dread two months in the year. One is December with its possible cold and injury to the crop, and the other is June with its almost invariable hot two or three days which cause what has come to be known as the "June Drop." Usually the drop has been about right to thin the fruit so that the trees carry about their proper amount. Some years the drop has been excessive, but there has never been a total failure. This year the hot weather came in the last two days of May and the first day of June, two or three weeks earlier than usual, and following a spell of cool weather that left the trees in no condition to stand a hot wave.

The drop has been very severe. Some growers have maintained that everything was on the ground, while many others are hopeful that at least a fair crop will remain on the trees. A careful grower at Colton states that he has made a very close count, even counting oranges on limbs of many trees, and says that if every orange now remaining on the trees can stand the rest of June, there will even then be not more than ten per cent of a crop.

This all refers, of course, to navels as the drop does not seem to have affected the Valencias. We hope this fruit grower's judgment is at fault, and that no such severe loss will be visited upon the industry. No other section estimates so heavy a loss, though all unite in predicting that the crop will be exceedingly short. However after the big year just past, the trees will take a deserved rest, and the fine fruit which will be given, and the larger prices received on account of the shortage, will perhaps entirely make up for the loss.

In this connection it may be proper to refer to a remark we heard many years ago in a fruit growers' convention. A speaker was enlarging on the necessity of thinning fruit if good, marketable product is desired. He said, "My experience last year made me resolve that this year I would thin my fruit down so that what little I did have would be of good size. At my first thinning I took off twice as many as I felt should be taken. In a short time I saw that too many were left. Again I took off twice as many as I thought should come off and again I found too many left. This time I knocked them all off and still too many were left on the tree."

A fruit growers eyes are not always the best judges. There may be "too many" oranges yet. The middle of July will tell.

NATIONAL APPLE SHOW.

Spokane is making arrangements for its second annual national apple show which will be held December 6th to 11th. The success of last year's show was most gratifying to the Spokane people, and attracted attention to the apple industry in general and to the "Inland Empire" as an apple center, as no other method could have done. We doubt not it has helped to greatly increase the consumption of apples, and from the swing of the movement which has already been started for the coming show, we presume an equal uplift will be given to the industry this year.

We congratulate the people of Washington on having so enterprising and pushing a community, and again call the attention of our California producers to the fact that they are missing an opportunity which should be taken to boost California apples. There is no section in the state of Washington which can show actual results in apple culture as can a small section of California known as the Pajaro Valley. There are many other sections of this state which produce magnificent apples, but none in the quantity of the little valley in Monterey and Santa Cruz counties. In fact, that one little valley produces more apples than all sections of the state of Washington combined. Yet it has never awakened to the advantages and benefits which may be secured by extensive advertising. Of course the growers have, as a rule, considered apples a staple like wheat and potatoes, and have not deemed it necessary to advertise in order to dispose of it. This may be granted, but the fruit growers, and especially orange and raisin producers, have proved within the last year that a little tooting of their own horns is wonderfully profitable. Perhaps the Pajaro Valley people would not see the advantage in holding a "national" apple show, or even an "international" one, but some plan of gathering together could be devised which wo give an uplift to the industry of that section which would be most beneficial.

A PROSPEROUS YEAR.

The Summary of the June Crop Report is just received from the Department and it appears, as a whole, to show a good outlook for the summer of 1909. Some crops of course fall much below the average of last year, but these are very few in number. The per cent of winter wheat is 80.7 and of spring wheat 95.2 as against 86.0 and 95.0 last year. In alfalfa the increase is material over that of last year and still more pronounced over that of the preceding year. In fruits, peaches show materially a poor conditon. The average for ten years is 62.1 but last year's crop shows a percentage of 73 while this year's crop drops to 54.1. Pears also, the country over, show rather poor condition, 61.8 as compared with 70.9 of last year. Lima beans are normal crops with practically the same percentage as last year. Watermelons and cantaloupes are practically the same as last year. Sugar beets show a much better condition than either last year or the preceding year. Cotton is about the average.

NEXT WEEK.

The first page article of next week's issue will be of special interest to all growers of alfalfa. The article will be largely made up of personal experiences of practical producers of alfalfa in the various parts of our state. Some of the answers are very short; some are more at length. All are filled with information of value. They are published in the same form as were the articles on irrigation and plowing in a former special issues. The Cultivator believes in having the best there is to be had from practical men, and has found this method to be the best for obtaining that result. Our next issue will be well worth filing away to keep.

DEVELOPMENT OF THE JERSEY.

The power of intelligence over animal life and the capacity to improve it at will, is shown in the development of the Jersey to her wonderful producing capacity. Amongst the Jerseys of this country are now seventeen individuals which are producing in excess of 700 pounds of butter annually, while the record holder shows a total yearly production of 1126 pounds and 6 ounces. More than a half a ton of butter in 12 months from our cow! And yet farmers are sometimes content to produce 130 to 160 pounds per cow.

FORESTRY AT HOME.

(Continued from Page 707.)

der him great progress has been made by the Government in bringing about the practice of forestry by forest owners and in awakening the great lumber interests, as well as the people in general, to the dangers of forest destruction.

The forest reserves lie chiefly in high mountain regions. They are 62 in number, and cover an area (January 1, 1905) of 63,308,319 acres. They are useful first of all to protect the drainage basins of streams used for irrigation, and especially the watersheds of the great irrigation works which the Government is constructing under the reclamation law, which was passed in 1902. This is their most important use. Secondly, they supply grass and other forage for many thousands of grazing animals during the summer, when the lower ranges on the plains and deserts are barren and dry. Lastly, they furnish a permanent supply of wood for the use of settlers, miners, lumbermen, and other citizens. This is at present the least important use of the reserves, but it will be of great consequence hereafter. The best way for the Government to promote each of these three great uses is to protect the forest reserves from fire.

State Forestry.

Many of the States have taken great and effective interest in forestry. Among those which have made most progress are New York and Pennsylvania. New York has a state forest preserve of 1,436,686 acres, and Pennsylvania one of 700,000 acres. Michigan, Minnesota, and other States are rapidly following their example.

In 1892 the first example of systematic forestry in the United States was begun at Biltmore, in North Carolina. It is still in successful operation.

The first professional foresters in the United States were obliged to go abroad for their training, but in 1898 professional forest schools were established at Cornell University, in New York, and at Biltmore, in North Carolina, and they were followed by the Yale Forest School in 1900. Others have sprung up since. At present, thorough and efficient training in professional forestry can be had in the United States.

Shop Talk

ARID AGRICULTURE.—This is the title of a most valuable book for Western ranchers. Its 450 pages are full of practical, and at the same time, scientific, information for the care of semi-arid land. It is written so that the average reader can receive full benefit of the author's vast experience. In fact it seems that Prof. Buffum has covered the entire field by giving the best methods for the dry farm as well as how to succeed on the intensive, irrigated farm. The price is only $1.50 postpaid and the Cultivator recommends it highly. Orders will be placed promptly upon receipt of the price at this office.

Agricultural Notes of the Pacific Coast

Northern California

Colusa has a new alfalfa mill.

The cherry crop is practically all in.

Lodi's new winery is expected to start August 1st.

The Bidwell ranch at Chico has a thousand barrels of vinegar "ripening."

A couple of hop contracts were made by Santa Rosa growers at 12¼ cents.

Deciduous shipments are increasing, some days 40 cars passing Sacramento.

The recent cherry carnival at San Leandro was attended by large crowds.

One planter set over 600 acres of figs at Willows, Glenn county, this past season.

A large creamery company at San Francisco has opened a branch in Sacramento.

Fruit growers near Geyserville, Sonoma county, are planning to can their own fruits through a co-operative cannery.

Many forest fires occurred in McCloud this week during the strike of lumber workers.

The supervisors of Placer county have commenced suit to collect delinquent sheep licenses.

Orchardists at Auburn, Placer county, are organizing a co-operative fruit marketing company.

A Santa Rosa farmer has an exhibition in the Chamber of Commerce of cork grown on his ranch.

The annual cannery picnic at Gridley was attended by the usual immense crowd and was a success from all points.

A corporation has been formed under the name of the Rancho San Miguel Creamery which will manufacture butter at Oakland,

Over a thousand tons of hops and wheat were burned at the docks at Port Costa causing a loss of over a half million dollars.

A practical test made of the precooling plant at Newcastle has proved the big plant to be most satisfactory in operation.

Internal revenue officers are making it uncomfortable for handlers in San Francisco who are selling butter with too great content of water.

Word has been received at the state horticultural commission office in Sacramento of the serious illness of Entomologist George Compere in China.

A Sutter county cherry grower has a tree which for the past four years has averaged 604 pounds of fruit per year. This season's output was 816½ pounds.

It is reported that a large ranch near Biggs, Butte county, will be devoted to a goat and sheep dairy for the purpose of making cheese from the milk.

The farmers picnic recently held at Arcata, Humboldt county, was a great success, and was attended by many local people and others who came on special trains.

Three warehouses at Colusa have been merged under one ownership and will hereafter be controlled by the Farmers Storage Co. The combined storage capacity is 60,000 tons.

Central California

Sanger is to have a 320 acre ostrich farm.

Watsonville ships $1,500 worth of strawberries weekly.

Wasco onion growers have found much profit in onions this year.

A good roads meeting will be held at San Jose June 26th and 27th.

Eight cents has been offered for new crop dried apricots at Hanford.

Fresno county is having an experience in the trial of cattle rustlers.

An association of water melon growers has been formed at Turlock.

The hay and grain crop about Hollister is reported to be normal this year.

Bids for the construction of a high line canal will be opened at Turlock July 6th.

Merced county is considering the advisability of voting bonds for better roads.

Barley on the Empire Ranch Kings county, is said to run 30 to 40 sacks to the acre.

One nurseryman has just planted 15 bushels of sour orange seed at his ranch near Porterville.

The first car of green fruit from the Visalia district was made up of peaches, plums and oranges.

The Farmers' Union of Santa Clara county, recently held a picnic at Alum Rock Canyon near San Jose.

A movement is on foot at Visalia to control the flood waters which have in the past done much damage.

Vineland in Kern river county reports hot weather bringing fruit out much earlier than anticipated.

Cutting and drying of apricots is in full swing at Hanford, and most of the orchards are carrying a full crop.

An examination for the securing of eligibles for vacancies in the forest service was held at Fresno on Wednesday.

The board of supervisors of Monterey county passed an order ending the life of the board of horticultural commissioners.

Movement of real estate in the Valencia section, especially in the orange groves has been exceptionally active in the last few weeks.

The California Farmers Union and fruit growers at Smith Mountain are entering into a contract for the handling of the coming year's fruit.

Three carloads of Southern California orange trees were received last week in Tulare county, and all of them passed rigid examination.

Central California fair dates for this fall are as follows: Bakersfield, Sept. 6th to 12th. Tulare, Sept. 13th to 18th. Hanford, Sept. 20th to 25th.

The Kings County Agricultural Association makes a proposition to the board of supervisors of the county to purchase the grounds of the fair association.

A Colorado cantaloupe grower contracted with growers in Turlock to grow a large quantity of melons last year, supplying them with seed, which contract he afterward failed to carry out, and in addition commenced suit to secure price of seed supplied. The suit has been decided in favor of the Turlock people.

Whittier is boasting over a golden calla lily.

Escondido's hay croy is much better than last year.

An orange grove recently sold at Azusa for $2000 an acre.

One apricot drying yard at Piru has 300 pitters at work.

The hot spell seriously injured onions in the Coachella Valley.

The hot winds seriously injured the potato crop of Escondido Valley.

A Redlands orange grower reports 1145 boxes from 229 four-year old Valencia trees.

Coachella claims the record for the first watermelons marketed in Los Angeles this year.

The cherry crop of Yucaipe, San Bernardino county, was exceptionally heavy and of fine quality.

The Union Sugar Co. of Betteravia, Santa Barbara county, is buying tracts of land near Lompoc.

The hot wind of the first of the month lessened the honey harvest materially in Ventura county.

The geological survey is taking steps to have more watering places on the Colorado and Mojave Desert.

A Ventura farmer calls us on the item regarding the six foot oats and maintains that he has oats eight feet high.

The annual meeting of the stockholders of the Mexican Cattle and Investment Co., was recently held at Santa Barbara.

The Ventura County lima bean growers are making an effort to have bean growers of the state join them in their marketing plan.

The San Bernardino horticultural commissioners have been active in keeping out shipments of citrus stock infested with red spider.

Lemon growers feel that the value of their industry will be greatly enhanced if the one and a half cent tariff on lemons is allowed.

During the recent high water along the Colorado river the constant occupation of many was watching the weak spots along the levee.

Imperial farmers are awaking to the fact that Johnson grass may prove a serious pest unless steps are taken immediately to control it.

The manager of the Uplands packing house is insisting that fruit be delivered to his house in better shape, and kept covered so as to be free from dust.

The committee appointed to devise plan of organizing a farmers' co-operative association at Calexico, Imperial county, reported favorably and an effort will be made to effect organization.

The board of directors of the Whittier Walnut Growers' Association elected the following officers: A. H. Dunlap, president; C. E. Cole, vice-president; S. W. Barton, secretary; Fred Hazzard, treasurer; E. Y. Partridge, manager.

The Saticoy Walnut Growers Association at its recent annual meeting elected the following officers and directors: J. M. Sharp, president; J. M. Dickinson, secretary; G. G. Crane, W. H. Layne, L. B. Hogue, T. A. Kelsey and H. F. Clark.

The Coast

Kendrick, Idaho, will ship fifteen cars of beans this year.

Milton, Oregon, recently observed Strawberry Day with great merry-making.

The sugar factory at Glendale, Arizona, started on the season's run June 16th.

Corn growers near Pullman, Wash., claim they are growing corn that beats Missouri.

The clip from 11,000 head of sheep brought $40,000 to one sheep raiser at La Crosse, Washington.

A twenty acre apple orchard near Garfield, Washington, netted its owner during the past year $10,000.

Five hundred students from the Oregon Agricultural College were guests at the Seattle Exposition.

The grain farms in the Nez Perce country, Idaho, are promising a fifty bushel per acre crop for this year.

Terrific rains and melting snows have been the cause of extraordinary floods on the headwaters of the Colorado river.

A corporation has been formed at Krupp, Washington, for the purpose of developing by irrigation a great quantity of dry land.

The beets being marketed at the Glendale factory in Arizona are rather small but very solid and with a high content of sugar.

Toledo, Lincoln county, Oregon, will hold a fair and festival principally devoted to the display of stock, on September 8th, 9th and 10th.

The next annual meeting of the American Association of Farmers' Institute Workers will be held at Portland, August 16th and 17th.

Farmers near Harrington, Washington, are holding this week their annual picnic lasting three days, at which horse racing and other outdoor sports are features.

The outlook for a record breaking crop on the farms of the Palouse country near Pullman, Washington, is better than in any former season for thirty-five years.

A farmer near Phoenix planted 200 acres to alfalfa, sowing thinly to barley as a nurse crop. He marketed 4000 sacks of grain besides getting a good stand of alfalfa.

A large tract of land was thrown open for entry at Phoenix on June 3rd, also another tract twenty-five miles southwest of Phoenix has received many settlers.

The state convention of the farmers union at Pullman, Wash., recently elected for its president, L. C. Crow of Palouse, and A. D. Cross of St. Andrews as secretary and treasurer.

The largest wool pool ever formed in western Oregon was recently formed at Corvallis where producers pooled over a hundred thousand pounds, but as the bids were not satisfactory, the pool was later broken up.

One sugar beet grower near Glendale, Arizona, has so many beets that the ordinary methods of hauling are entirely inadequate, so he makes up a train of ten wagons and hauls all in with one traction engine. The train hauls greater tonnage than could be loaded on an ordinary flat car.

FOR MOULTING HENS

Feed

MIDLAND

Poultry Food No. 4

$1.95 per Sack

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.

Profit in the Poultry Yard

By Mrs. Frank Metcalf

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

PRESERVING EGGS.

Eggs to be stored should be, first, from hens that have no males running with them, because an infertile egg keeps longer, even without the use of a preservative, than a fertile egg; second, perfectly fresh, for not only will they keep much better, but if an egg which has begun to decay is placed in the same vessel with fresh ones, it is likely to affect all the surrounding eggs; and third, perfectly clean, for filth of any kind adhering to the shell will taint the preserving medium and thus taint the other eggs.

In placing eggs in the preservative, be careful not to crack the shells. Keep them in a moderately cool room where the temperature may be kept fairly constant. A dry, clean cellar is a suitable place.

Of the many methods which have been tried for preserving eggs on a small scale, none has proved more successful than the use of water-glass (sodium silicate). This is a very cheap product that can usually be procured at not exceeding 50 cents a gallon, and one gallon will make enough solution to preserve fifty dozen eggs, so that the cost of the material would not exceed 1 cent a dozen. Pure water, that has been boiled and then cooled should be used. To each 15 to 20 quarts of water, 1 quart of water-glass should be added. The solution should be prepared, placed in the jar or other suitable vessel, and the fresh eggs added from time to time until the jar is filled, but be sure that there is two inches of the solution covering the eggs. The eggs should not be washed before packing, for washing injures the keeping quality, probably by dissolving the mucilaginous coating.

A good lime-water preservative may be made as follows: 30 gallons of water, 10 pounds of salt, ½ bushel finely slaked lime. After mixing thoroughly, allow the solution to stand two or three days and then remove the clear liquid by dipping, or by means of a siphon. Place the liquid in a tub or other suitable receptacle and place the eggs therein, or the eggs may be placed in the vessel first and the lime water poured over them. Have about two inches above the eggs. Limed eggs can be discerned by the roughness of the shell.

Before boiling eggs which have been preserved in the foregoing ways, the shell should be punctured with a needle otherwise it is apt to crack as soon as placed in hot water, owing to the pores being closed.

Eggs can be preserved for several months in dry salt. Have at least two inches above the upper layer of eggs. Packing in bran has also been found satisfactory in many cases.

GAPES AND THE CURE.

Strictly speaking, gapes cannot be called a disease, since chicks that are so afflicted are in a physically perfect condition. The trouble is caused by a small red worm, or rather by a collection of such worms, which gather in the windpipes, and as they grow interfere with the breathing and cause the chicks to gasp and after a while strangle.

The worms are the larvae of eggs deposited in the filth of the yards or coops, and are hatched after being taken into the chick's throat.

They are, when full grown, about one inch long, and very much resemble a pale streak of blood.

Incubator chicks and those which run on clean grassy plots, away from the haunts of the older fowls, are never known to have gapes; while on the other hand, those which run in yards which are bare of grass, where fowls have been kept year after year, will almost invariably have gapes.

Just guard against the disease by observing a few simple rules, is the best advice. Keep all young chicks on clean ground away from the house, where old fowls have not trampled over it.

Sprinkle lime and carbolic acid over the yard, house and walks, and see that only fresh water and pure food are given the chicks.

If only a few chicks are affected they may be relieved by inserting a feather stripped to within an inch of the tip into the windpipe and turning it gently as it is withdrawn. The worms will adhere to the feathers, and thus give the relief sought.

Violent sneezing will dislodge the worms and give relief, and this may be produced by fumes of tobacco smoke or carbolic acid. If using tobacco, catch the chicks and put them in an ordinary bushel feed basket, with any kind of an old cloth thrown over it. Set the basket over a barrel with both heads out and place the tobacco on some live coals in the bottom.

Watch the chicks carefully, so that they do not smother, but let them remain until they become quite dizzy. The sneezing thus produced will give relief.

When using a feather hold the chick between the knees, with back toward you. Then, with the left forefinger and thumb, open the mouth, holding the neck well up.

The windpipe will be easy to reach with the feather, which you have previously arranged.

A small piece of camphor the size of a pea will often give relief, as will also an up and down pressure on the fore part of the neck.

When the first signs of gapes appear the chicks should be removed to coops as far distant as possible from the house and kept there until they have passed the danger age.

If they are taken to a place like that when first hatched there will never be a case of gapes among them. —American Farm World.

A FEW WORDS ABOUT CHEAP POULTRY HOUSES.

It frequently has been said that a hen regards not the rules of architectural beauty nor does she take any pride in having her house furnished forth with an array of ingeniously contrived fixtures of one kind or another. All a hen needs is comfort, and if she is supplied with food, water and a clean, light, dry house, free from draughts, she is in a position in

which she will fill her station in the scheme of the universe and perform her full duty.

The beginner need not be ashamed of a cheap poultry house. It is better to buy good stock and put it in a cheap poultry house than to save money on the purchase price of stock and use it in building an expensive house. When any one starts in to begin a new business the venture is always something of an experiment. If the beginner in poultry keeping builds elaborate poultry houses and makes a failure of the business, the houses are dead property, worth but a small fraction of their original cost, while good stock is always at par. For this reason comfort rather than elegance should be the rule in building the first poultry house.

The plainer the inside of a poultry house is, the better it is for all practical purposes. A plain box-like structure, the walls made of common lumber, well battened, and lined with tar paper, so as to make them wind proof is as good as walls of stone or brick would be. On the south side leave an opening three feet from top to bottom, the whole length of the building, covering this with heavy muslin and we have a cloth front house in which the matter of ventilation is solved, to which light is plentifully admitted and where dampness will have no place. In such a house colds and roup will not originate and properly fed hens will lay right through the winter.

Such a house, which will answer every purpose, can be built at an expense not to exceed 50 cents for each hen it shelters. A house of this kind 10x15 in size, contains 150 feet of floor space, which is ample room for 50 hens if they are allowed to run outside every day when the weather permits.

Very frequently second lumber may be secured and when this is covered with paper roofing it is as good as a house made of first class lumber would have been.

Much has been said about the piano box poultry house and we have seen many such houses which were made at low cost yet served their purpose admirably. Not long ago a beginner whom we visited apologized because his poultry houses were cheaply made. When we looked over the flock and noted the healthy appearance of the birds we concluded no apologies were needed and when we got the figures showing the productiveness of those hens we called to mind many flocks, kept in costly houses which never did as well.—Poultry.

EGG PRODUCTION OF THE DAUGHTERS OF "200-EGG" HENS.

There has just been issued by the Maine Experiment Station Bulletin 166, having the title "Data on the Inheritance of Fecundity Obtained from the Records of Egg Production of the Daughters of "200-egg Hens." This bulletin sets forth the results of an experiment designed to test the plain question of fact as to whether the daughters of "200-egg" hens were or were not better layers than the daughters of hens which were not such heavy producers. The results of the experiment were in brief as follows:

The daughters of "200-egg" hens were in this experiment very much inferior to their mothers in average egg production. This is particularly true of winter egg production.

This experiment gives no evidence that there is a sensible correlation between mother and daughter in respect to egg production, or that egg producing ability is sensibly inherited. A relatively high producing mother was as likely as not to have relatively poor producing daughters in this experiment.

In this experiment the daughters of "200-egg" hens were not such high egg producers as pullets whose mothers' egg records fell in the 150-200 egg class. The daughters of the "200-egg" hens were most inferior (proportionately) to the "unregistered" pullets in respect to winter egg production.

Pip is a symptom of a disease just as a furred tongue in a human being indicates a departure from normal health. The cause of pip may be bronchitis, impaction of the crop, or some internal inflammation; search for the cause and remove it. Smear the tongue with glycerine. It will soften the scaly matter; then remove it and smear again with glycerine. Give ten drops each of nux vomica and aconite to each one pint of drinking water until normal health is restored.—Poultry Tribune.

If all our fowls were all we claim, there'd be no need to claim it.

A couple of extra eggs per head is all added profit—therefore worth working for.

No Flies at MILKING TIME!

Don't blame the cow for switching her tail so furiously. Don't throw the milk-stool at her because she "side-steps" and upsets milk pail. The critter can't help it when flies are constantly prodding her hide for warm red blood.

Conkey's Fly Knocker Knocks Flies

Spray your cows with Conkey's Fly knocker and the flies won't come near. It drives them away. The greatest discovery of the age. Sold under a positive guarantee. Prices—qt. 35c; ½ gal. 60c; gal. $1. Agents wanted everywhere. Write today.

Coulson's EGG FOOD

At this time of year the hens are apt to begin falliug off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting, they are likely either to take a long time over the molt, or if they molt quickly to have another molt in the late fall.

A scientifically prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS, and keep your flock in healthy condition for the molt.

For sale by dealers everywhere. Write for our free book "Poultry Feeding for Profit" with samples of our Poultry Food.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Fall Potatoes.

When is the best time to plant potatoes for a fall crop in light sandy soil? The great question with me now with my spring crop of potatoes is shall I continue cultivating or not after they have set. As long as I cultivated they apparently made strong vigorous growth. I was advised that the cultivation was not necessary so long as I irrigated them. I have put the water on them every week but they do not seem to respond in growth as they should. Is the fault with the soil, lack of cultivation, or water?—Subscriber.

You can plant potatoes for fall crop any time from July 20th to August 10th. It is best to cultivate after irrigation. Few crops will do well if only irrigated. Without seeing the soil it is difficult to say just what is the trouble. Possibly the soil is very poor, and if so, no amount of water or cultivation will bring the best results. If the soil is in good condition regarding fertility, then I should think the chief fault lay in lack of cultivation.—Q. A. L.

Keeping Bulbs.

How should I keep Easter lily bulbs which have been in pots and have blossomed? Can I leave them, only withholding the water, or should they be taken from the dirt? When should they be planted to bloom at Easter? This year they did not bloom till June. What is a good fertilizer for greenhouse plants? How much should be applied?—F. B., Los Angeles.

It would be best to plant your lily bulbs out in the ground. The florists put strong well grown bulbs in pots in the fall and place the pots in a cool dark place for six or eight weeks where they form roots and get ready for growth when brought to the light and given proper temperature. At the proper date they are put into the greenhouse where they continue to grow and come into bloom at Easter. Before coming to California I grew large numbers of the lilies for the Easter trade, but have not done so here. Any of the Los Angeles florists who force them could give you the date at which they should be brought into the heat and light. Pulverized sheep manure is one of the best fertilizers for house plants. Use a small handful well dug into the soil about every three or four weeks. —Q. A. L.

Mr. Morris of Morris & Snow Seed Company tells us that it is impossible to secure Easter bloom in the open ground. The bulbs must be put in pots where a little heat may be given for the last month or two. The bulbs should be planted as early in August as possible.

Goes To Seed.

Why do most of my vegetables go to seed and become useless? This never happened to me before. My land is sandy loam, well manured and watered. My mammoth blackberry plants four years from the nursery, and which have heretofore borne heavily, have this year set practically no fruit, though treated the same as in the past, being well cultivated and manured. The ground this year is full of suckers. Should the plants be renewed? I wish to grow a hedge of the Italian cypress. When should I plant the seed to be ready for spring? Is there anything better for hedge in Monterey county? Can I plant hedge on line along road way, or will I have to set it entirely on my own land?—Easterner, Greenfield.

One reason for your vegetables going to seed would be that they were procured from poor stock. There are seed houses and seed houses—but you should buy from those which have been long known to be reliable.

As to your blackberries, it is difficult to say where the trouble lies. Your treatment seems to have been all right. Those suckers, however, must be destroyed and kept cut out. It is often a good plan to mulch heavily with stable manure, not cultivating but watering freely. A blackberry patch is good indefinitely if free from disease and in vigorous growth.

The cypress seed should be planted now, but unless you have had experience, don't attempt to grow them from the seed. The raising of evergreens from seed is difficult work requiring skill and special facilities. You will find it better to buy the young plants from professional nurserymen. Viburnun tinus, popularly known as Laurustinus, is a far better hedge plant. It bears pruning and shearing and is always beautiful. I know of no hedge plant that is its equal in Southern California. I know of no law that would prevent your setting the hedge on the lot line, but it might be wise to allow all of the hedge to be on your own property.—Q. A. L.

About The Willow Baskets.

Replying to the inquiry of B. J. O'M. in our issue of June 3rd, we have received suggestions from a subscriber that the best information on the making of baskets, which may be had outside of actual experience under a skilled instructor, is to be found in "Practical and Artistic Basketry" published by Kinsley, New York, 1904, and "Basket Designs of Indians of Northwestern California" by Kroeber, Berkeley, 1905. In addition to this suggestion, we have the following letter from a Japanese subscriber and well wisher of the Cultivator, located at Oakland.

In a certain district of Japan, making willow baskets is the principal work of the farmers and they cultivate the willow trees, but I am wondering if there is the willow tree specially fit to make baskets of in this country, as there are two species of willow trees and the common species of Salix multinervis can not be used for the purpose, but Salix Rubra Huda is the one specially used to make the baskets. However I will state a little how the trees are treated in the district of Japan.

1. These trees will grow well in fresh soil or sandy loam, but in a damp place they grow too big, so that they do not fit for the purposes. Of course they must be irrigated when it is too dry in mid-summer.

2. Plow the ground about eight inches deep in April and harrow. When the ground is ready cut the limbs one foot long and stick them in the furrows (20 inches wide) one foot apart leaving the tops two inches above the ground. This sticking limbs can be done in October again if the climate is not too cold.

3. When fresh leaves come out cultivate between the furrows. Pour extract of barnyard manure near the plants. Cultivate and manure again at twenty days after this. In the next April dig two or three inches deep near the plants and manure.

4. The limbs for the purpose must be straight and long. Therefore pick all sprouts off around the limbs, taking care not to strip off any bark with them.

5. After fifteenth day of April of the third year, cut the straight limbs with very sharp knife at half inch above the ground. Cut them again from twentieth day of August to September at one inch above the ground this time.

6. Make small bundles of them and lay them in the ground or damp place. Dip them in water and when sprouts come up five inches, strip off the bark as smoothly as possible with bamboo knife or two pieces of splinted bamboo. Wash them clean and dry them in sun.

7. Dry them in sun from 10 a.m. to 2 p.m., on one side, and to 4 p.m., the other side, for about three days. If stripped in a rainy time so they could not dry quickly, never get white limbs, but brown or red ones. After they are dried well wrap them with matting and keep them in dry place.

8. Sprinkle water over them when they will be used and use them quickly while they are wet yet. If they

are sprinkled and dried many times, the white color will be lost and the quality will be poor too.

9. Making willow baskets is just the same as making any other basket or matting.—K. Ikeda, Oakland.

Carbon Bisulphide at the Roots of Trees.

Will carbon bisulphide, when used adjacent to apricot trees to kill squirrels, applied by saturating a piece of cloth about the size of a walnut, throwing down a hole and covering hole, injure the tree in any way?—H. E. T., Santa Paula.

If the ground should be saturated with water and the hole closed perfectly tight, also close to tree, is is barely possible that some injury might result to the roots, but unless the bisulphide came in direct contact with the roots, we do not think any injury would be caused.

Summer Pruning.

What is your idea of pruning in May young apricot trees that were set out the previous February and which have a vigorous growth?—H. E. T., Santa Paula.

Thumb pruning by which sprouts are kept from growing where they are not desired or pinching back of strong growing limbs which are taking more than their share of the growth, are permissible during the growing season, but summer pruning, i. e., taking shears and pruning back any considerable amount of growth would be very objectionable. "Summer pruning for fruit and winter pruning for wood" is an old adage. What the grower wants of the young tree is wood growth. Encouraging the formation of fruit buds should be left until the tree has grown for three or more years. Hence in the young tree we should encourage in every possible way the formation of leaves, trimming as few as possible during the summers of the first two or three years. The winter pruning should then be very severe to encourage strong wood growth next summer.

Bordeaux Mixture.

Please tell me how to apply Bordeaux mixture? I have tomato plants which are infested with soft green and also striped worms.—G., Porterville.

Our subscriber, if he has written his letter as he means, does not seem to have a correct idea of the value of Bordeaux mixture. It is purely a fungicide, unless poison is mixed with it when applied. The formula for Bordeaux mixture may be seen in many of the back numbers of the Cultivator, or especially in the issue of March 12, 1908. This contains formulas for contact insecticides, poison insecticides, and fungicides. Our inquirer must bear in mind that there are insects which must be reached by contact poisons, that is, they get their subsistence by inserting a tube and sucking the juices of plants. All the poisons you wish to apply would never affect these insects in the least. Therefore they must be suffocated or killed by a spray of oily or caustic nature. The poison insecticides are used for an entirely different class of insects, those with jaws which eat of the leaves. Paris green or other arsenate poisons are sometimes used with fungicide sprays. Unless this is done, the one use of the fungicide spray is for the fungous troubles.

Peanuts.

What is the proper way to raise peanuts? Should the blossoms be covered and how much irrigation should be given to the plants?—E. F. L., Inglewood.

Information regarding culture of peanuts may best be had by referring to the California Cultivator of April 23rd, 1908. The blossoms are not usually covered, for if the soil is light sandy loam, which is about the only soil peanuts will do well in, the buds will attend to their own burying. Irrigation will depend upon the soil and cultivation. The article referred to names the middle of June as time for the first irrigation. Some growers produce good crops without any irrigation at all.

Various Questions.

Please give process of curing figs. What may I use for exterminating worms on cauliflower, cabbage and bean plants? I send sprig from a pear tree. Will you tell what ails it and give a remedy. The buds all blighted and I pinched them off and a few leaves came out, but now they are dying.—C. D. T., Buena Park.

Pick figs from tree so as to secure entire stem, but not until fruit is entirely ripe. Some growers allow the fruit to drop and then gather it from the ground. Place fruit on trays and expose to the sun. Do not allow to dry too hard, and when sufficiently cured put in sweat boxes for several days. When ready to pack away the fruit should be dipped in boiling salt water or, as some growers prefer, in a boiling thin syrup. This makes the fruit more handsome in appearance and more pliable, and at the same time destroys any insect eggs which may have been deposited on the fruit. Some prefer to sulphur the figs for from fifteen minutes to an hour before putting on drying trays. If the fruit is large, it will have to be turned to prevent souring. It should be turned several times during the process of drying.

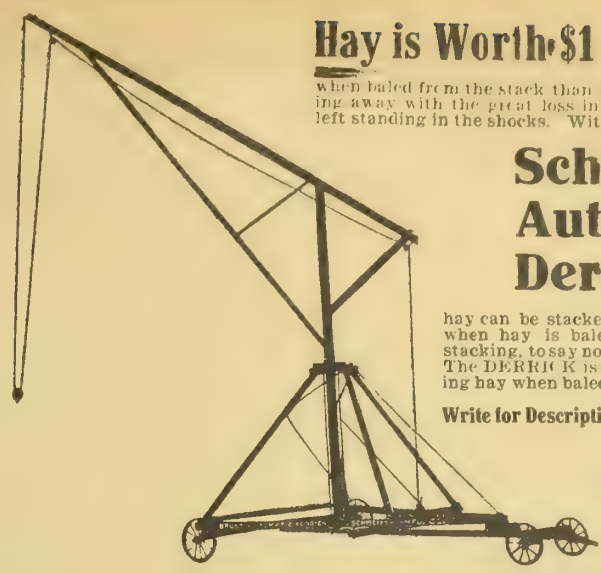
The worms may be destroyed by spraying with tobacco extract, kerosene emulsion, or whale oil soap. If the worms are leaf eaters, flour and Paris green may be sifted over the plants, which will dispose of them effectively, but care must be taken in handling the Paris green which is a deadly poison.

The sprig from the pear tree was insufficient to enable us to determine what the trouble might be, but from the letter we imagine this is simply a case of the regular pear blight which is devastating many orchards and causing much loss in the state. The method of handling is to simply cut off the diseased parts, using sterilized instruments, taking care to sterilize after each cutting. There is no spray which will reach this disease. If all pear growers in the same neighborhood would work together in this way, we doubt not the disease would be checked speedily. This remedy of cutting is according to the best information given to the pear growers by experts from the Department of Agriculture.

Size of Fruit Boxes.

What is the size of boxes referred to in article on thinning fruit in issue of May 20th by Mr. O. B. Whipple of the Colorado Agricultural College?—L. J. P., Orloff, Butte Co.

In response to this inquiry Mr. Whipple has furnished us with the following dimensions, inside measurements: Apple boxes, 11½x11½x18; pear boxes, 8½x11½x18; peach (extra grade) boxes, 4x11½x18; peach (fancy) boxes, 4½x11½x18; peach (choice) boxes, 5x11½x18.



Hay is Worth $1 per Ton More

when baled from the stack than out of the shock, besides doing away with the great loss in weight which results when left standing in the shocks. With the

Schmeiser Automatic Derrick

hay can be stacked for 15c per ton, therefore when hay is baled 85c per ton is gained by stacking, to say nothing of the saving in weight. The DERRICK is worth its cost alone for loading hay when baled.

Hay.

Scott and Magner say: All the hay districts are now shipping or about to ship, so that from this time on it may be expected that this market will receive large quantities steadily from the fields.

Statistics taken June 1st, 1909, show that 15 per cent less hay was received in San Francisco for the year than was received during the preceding year, which tends to show that the dull condition of trade, as well as the extremely high prices which prevailed during the past year, caused a heavy decrease in the consumption of hay in this county. There is severe complaint among all consumers of feed that it is impossible for them to use feed satisfactorily for the coming year on this extreme basis of prices.

The alfalfa hay market is slow, as there is practically very little arriving and no established basis for trading.

Conditions of straw are about as they have been, with the exception of the arrival during this week of a few cars of new straw. As the new crop straw becomes more active in the market, our prices that at present govern, must decline somewhat.

Deciduous Market

Sacramento, Cal., June 19, 1909.

The market on cherries since our last report has declined a little, which is due to poor condition of the fruit on arrival. The market in Chicago yesterday was as follows: Black Oregons 70c to $1.10; Black Republicans 85c to 95c; Royal Annes 55c to $1.45. Shipments from Placer and Solano County are very light, and will be cleaned up this week.

The peach market has also declined somewhat this week, especially on the Alexander variety. Chicago reports them selling at 55c to 60c delivered. New York 80c to $1.10. The decline is due to the heavy shipments of peaches and also the fact that the Alexander is an undesirable seller.

Clyman Plums have held up very well, the same averaging $1.00 to $1.40 delivered.

Royal apricots have sold exceptionally well, there being a good demand for this variety in all markets. At present they are averaging in the auctions $1.70 to $2.10.

On the sixteenth instant the prices paid to the growers, established by the commercial companies, were as follows: Triumph 55c; Alexanders 45c; Hales Early 45c; Clymans 60c; Red June 70c; Botan 70c; Climax 75c; Tragedy 85c; Cots 70c.

Very few Tragedy and Climax have been forwarded so far, although these varieties together with Red June, Botan, etc., are expected to come in next week in liberal quantities.

We had a light rain on the seventeenth instant, but from reports received no damage has been done to the fruit.

Shipments up to the eighteenth showed a total of 481 cars as compared with 596 in 1908.—T. C. Tucker.

Citrus Market

LOS ANGELES, June 23, 1909.

Valencias are going forward at the rate of nearly a hundred cars a day and are meeting with very satisfactory reception. The general tone of the market at present is very good in all parts of the east. As a rule, there is no "dry" fruit although fruit from some sections where the cold was extreme show some pithiness.

The tone of the lemon market is exceptionally good, and the fruit is being pushed forward as rapidly as possible.

Shipments.

Total shipments of oranges to date since November 1st are 26,406 cars and of lemons 3,991, or a total of citrus shipments for the season of 30,397 cars.

NEW YORK, June 21.—Thirty-four cars oranges sold. Market firm on good stock, with easier tendency. Very hot.

NIGHT SOIL.

This fertilizer is highly recommended not only for squash but for cucumbers, melons, etc. Place a small shovelful in a hole made in the earth. Then thoroughly mix it with the soil. Do not plant the seed directly in the mixture but cover it with good soil and plant the seed in this. Hen manure or rotted barnyard manure may be used in place of night soil. Do not permit any kind of manure to come in contact with the roots of plants or trees, until it becomes at least partly dissolved or rotted.

Stop a moment and consider how important it is that you keep your horses in good condition, especially if you are expecting to sell them. If you have a blemished horse, write for my free book telling how to treat them. ABSORBINE is performing wonders in removing Puffs, Thoroughpins, Curbs, Enlarged Glands, Swellings, etc. ABSORBINE at your druggist's. $2.00 a bottle or delivered postpaid. Made only by W. F. Young, P.D.F., 244 Temple St., Springfield, Mass.

Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Fistula.

My mare bruised her shoulder near the top. A sore formed which I treated with peroxide. Soon another formed on the opposite side. They seemed to be getting well until lately a new opening appeared near the others and is discharging freely.—W. R. T., Calistoga.

Your mare has a fistulous sore which will make you plenty of trouble before it gets well. It ought to be opened to secure complete drainage. You had better get a good veterinarian to treat her, otherwise, it may never be cured.—R. T. W.

Dry Hoofs.

My mare seems to be stiff in her front quarters when first hitched up. After travelling a few minutes she shows no signs of being sore until a few minutes after she is stopped again. The bottoms of her hoofs are very hard and dry. The frogs are like horn.—Subscriber, Buena Park.

You have told the story yourself. The mare's feet are too dry and hard. They should be softened. The simplest way is to stand in mud. You can wrap her feet in swabs saturated in neat's foot oil, the natural oil of the foot.—R. T. W.

Itching.

My mare seems to itch badly, especially near the tail. She bites herself and rolls frequently.—J. A., Ripon.

Rub in with brush once daily a solution of eucamphol and water, fifty parts of water to one of eucamphol.—R. T. W.

Hoofs Breaking.

Is there any food or tonic which will make a horse's hoofs grow? My horse's hoofs are very soft and brittle and cannot hold a shoe more than a week or two. He is kept on alfalfa pasture to wet his hoofs with dew and fed same as other horses which show no sign of this trouble.—O. P., Chico.

Bran, oil cake and any foods high in nitrogen will induce hoof growth. The continual use of coal oil in the hair above the hoofs will stimulate hoof growth, and saturating the hoof with coal oil will also prove beneficial. The hoof grows very slowly, so it will take a long time.—R. T. W.

Fits.

I have a horse apparently troubled with epileptic fits. When bridled, the jaws and muscles of the neck and head twitch and jerk. Sometimes he falls and his head will draw back to the top of the withers, mouth wide open. He will stay in this condition for a minute or more, then will stagger up and seem to be blind for five minutes or so. After a half day's work he is very weak. He is a fine-looking animal and appears well.—H. D., Guernsey.

You are undoubtedly right about the horse having fits. They are always followed by great weakness. There is no satisfactory treatment. In time he may recover, but work and excitement seem to make horses in this condition much worse.—R. T. W.

Abscess.

My horse recently had a lump on the middle of his lower lip, with swelling on his lower jaw. We thought he had been stung, and treated with ammonia and turpentine. Later the swelling enlarged and broke, and pus and blood escaped. Recently another lump formed on the right side of his throat from which pus is escaping. Does the horse need a blood purifyer?—J. P., Escondido.

The abscess should be cut open to allow the pus to escape as soon as you are sure pus has gathered. Then wash clean, using an antiseptic wash composed of creolin or carbolic acid and water—not too strong. I do not think a blood purifier is necessary.—R. T. W.

DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts." $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder. Forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.

Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

POULTRY AT THE STATE FAIR.

A letter from Mr. E. K. Healy, Superintendent of the poultry department of the California state fair calls attention to the fact that there is less than two months for the poultry fraternity to get busy and get an exhibit of poultry worthy the coming state fair. Mr. Healy remarks that the society has done more for the poultry people in the shape of prizes than ever before. Last year $933 was divided among the fanciers there. Of course, poultry people usually complain as to the time of the year in which the fair is held, as it is practically in the middle of the moulting season, but we have noticed in the past that some remarkably fine stock was exhibited at the fair, the youngsters especially being of fine class. It is too late now to do much selecting and training up, but we imagine that if our fanciers have any stock which is available, the returns from the advertising secured at such an exhibit will be well worth the effort. Mr. Healy writes us that there will be lectures by experts from the University of California, not only regarding poultry but pigeons as well.

AN ACRE OF LAND.

The Kansas City "Star" says a good farmer can raise on one acre of land any one of the following:

One acre of onions, 445 to 600 bushels.

One acre of tomatoes, 300 to 400 bushels.

One acre of sweet potatoes, 500 to 600 bushels.

One acre of beets, 300 to 400 bushels.

One acre of carrots, 300 to 400 bushels.

One acre of cabbage, 8,000 heads.

One acre of potatoes, 100 to 300 bushels.

Here are actual results, each item referring to the product of an acre where the grower was a specialist:

Asparagus, 300 bunches, 20 cents a bunch, $600.

Cauliflower, 100 to 300 pounds, $450.

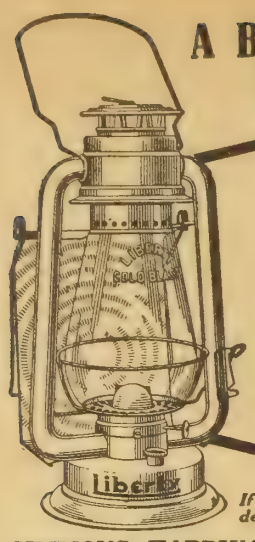
Onions, 600 bushels, 75 cents, $450.

Cabbage seed, 1,000 pounds, 40 cents a pound, $400.

Potatoes, 175 bushels, low estimate, $175.

Cabbage, 7,000 heads, $500.

The farmers' club of Mound, Ventura county, is moving for good roads.



A Big, White Light

Every detail of every Liberty Lantern is the best. Best material. Best workmanship. Best design.

Liberty Lanterns

give the biggest, clearest light. The burners are supplied with just the right amount of air. The globes are of the finest lead flint glass. They are tight and compact. Never rattle. Never blow out or jar out. Bail stays where you put it. The simple globe lifting device makes lighting easy.

Angle Lamp

The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under an absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.

GREAT ECONOMY—COST LESS TO BURN than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT, soft,** steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

Household Department

THE HOME TANNERY.

I read a funny ad in our
  Farm paper t'other day,
From some concern what handles furs,
  Which started off this way:
"Attention—Let us Tan Your Hide!"
  In big, black letters, too.
Now, if you were a boy like me,
  How would that look to you?

I don't see how they get replies
  From funny ads like that.
I wouldn't want to send to them,
  I'd be too mortal sca't.
Besides, I get it here to home;
  Sometimes it's pretty rough.
If there's a hide to tan, I guess
  Pa does it well enough.

—Joe Cone.

COMING TO A DECISION.

I CAN'T give you any answer today, Charlie."

You've been saying that for three months."

"And I suppose I'll continue to say it till I make up my mind to—"

"Be married?"

"Oh, no; I've decided upon that."

"You mean you haven't decided on the man you will marry."

To this the only reply was a far-away, dreamy look.

"How many of us are there?"

"How disagreeable of you! You seem to intimate that there are a large number, whereas there are only two."

"That simplifies it immensely. I infer from your putting me off rather than refusing me that I'm one of the two. Now, how would it do to decide between the two by tossing a coin?"

Again that far-away look, then: "Suppose you lose?"

"I shall have to bear my disappointment like a man."

A dissatisfied look passed over her face. She was silent.

"What's troubling you?"

"I was thinking of my own disappointment in case the coin fell the wrong way."

"But I thought there was no wrong way for you."

No reply.

"Does the other fellow possess an advantage that has nothing to do with love?"

"No?"

"Then, if you can be happy with either of us and can't decide between us, why should you not be satisfied with the decision of a toss?"

"Why, because how stupid of you—the coin might decide the wrong way."

It was his turn to pause. He was of a scientific turn of mind and had a fancy for paradoxes, but there was one that baffled him.

"I have it," he said, finally. "We'll toss the coin, and if it falls the wrong way you are to have the privilege of deciding the right way."

She neither assented nor dissented, and taking a quarter from his pocket he said: "I choose this eminently respectable head with a serious face, a wreath and the motto: 'In God We Trust.' I am perfectly willing to trust in God."

"You said that just as if you had no confidence whatever in me."

"You, not being able to choose between two lovers, are not to be relied on by either. I have chosen heads, there remains for my rival the spread eagle with an olive branch in one claw and a bundle of arrows in the other, by which he means: 'If you marry me I'll love you; if you don't I'll shoot you.' There's a ribbon in his mouth which means: 'You shall always be dressed up mighty fine,' or, in other words: 'I'll give you everything you want.'"

"That's just what makes me hesitate. You cooly arrogate everything to yourself. You choose the head and the motto: 'In God We Trust,' leaving for—for the other—a spread eagle, as you call it, with your own interpretation of the emblems."

"I'm going to put an end to your hesitation. Up she goes!"

He flipped the coin, and as it came down he put his hand over it.

"Before you know who has won," he said, "I want to know if you intend to abide by the decision?"

"I suppose so—that is"—

She got no further. He tried in vain to get a more definite reply. At last he took away his hand and showed the coin—tails up.

"He has won," he said cooly, putting the piece in his pocket. "Permit me to congratulate you."

"On what?"

Her eyes wandered all over the room, lighting nowhere.

"Tell me plainly," he said, "without beating around the bush, are you satisfied or dissatisfied with the result of the loss?"

"I might not be satisfied if—that is—

She paused and looked out of the window. On her fair young brow were the gentle corrugations of perplexity.

"Well?"

"You seem to be satisfied."

"I? What has that to do with it?"

"If you had shown even a tiny bit of dissatisfaction—"

"You would have been satisfied?"

"You're always misinterpreting what I say. I didn't mean that at all."

"Come; we're making no headway. It was agreed that if the coin fell the wrong way you were to have the privilege of deciding the right way."

"But I told you at first, I can't decide, at least not just now."

"Then I suppose we have spent all this time for nothing. I'm worn out with trying to bring you to a decision. I'm going away for a long while—a year, two years, five if necessary—to overcome this infatuation for a girl who doesn't know whether she wants me or doesn't want me or wants somebody else or—"

"There's one chance for a decision," she interrupted, "that you haven't thought of."

"What's that?"

"You might toss again."

He sent the coin spinning in the air, and without waiting for it to come down took her in his arms.

The next morning her little brother was munching candy. When asked where he got the money to buy it with he said he had found a quarter under the piano.

About the House

THE store windows are telling us that the Fourth of July will soon be here, and the small boy, and the small boy's father, and his grandfather, and his great-grandfather, too, linger long over the display of flags and fire works. It is just as much nonsense to talk of "buying fireworks for the children" as it is to say you "go to the circus to take the chil-

dren." Deep in your heart you know you enjoy the fireworks and the circus just as much as the children do.

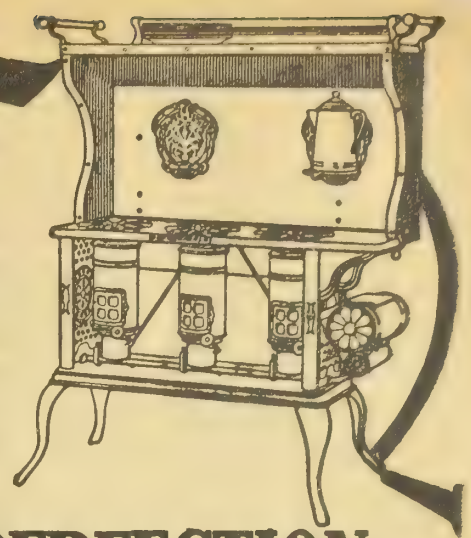
The question that confronts many of us at this time of the year, is—"Where shall we spend the Fourth?" Perhaps some of us older ones would prefer to remain quietly at home, but the younger members of the family vote a noisy "no" to that proposition—and I am glad they do. The Fourth of July is a day to be celebrated. According to one small girl—"the Fourth was made so we could have fireworks," and she was right. What if it is a noisy and strenuous day—noise is healthful and wholesome and if carefully managed by the older heads the various amusements of the day need cause little uneasiness to careful mothers. If there is no "big" celebration near you, or if for any reason you think it better to keep away from the crowd, why can not you and your neighbors have a real, genuine "Fourth of July celebration" of your own, planned like the big ones, with flags, music, speeches, firecrackers, games, and a good dinner, with ice cream and pink lemonade. Does it look like too much work? Divide it up. Let some arrange for the music—you need not hire a brass band. You have some people in your neighborhood who sing and perhaps some who play the drum or fife or cornet or banjo—any or all of these would make good music. Have plenty of patriotic songs. Let those who live nearest the place selected for the celebration see that a few comfortable seats are provided for the older people and good drinking water and wood to make a fire to make the coffee. Have some one read the Declaration of Independence, and all of you listen to it—it will do you good. Have a short address—every country neighborhood has a good talker or two; have a few recitations by the little folks—patriotic subjects—something that they can understand. Have plenty of "fire works" and races and games of various kinds for the active pushing youngsters who find it hard to keep still. See that this part of the program is managed by a cool headed person, but one who has not forgotten how to have a good time. Have a ball game, a sack race, a potato race—all make fun and with flags and fire crackers you may have just as good a time as if you had a thousand people instead of twenty or thirty or fifty. And when it comes time for the "eats" as one little two-year-old always calls a company dinner, let the older people sit back and allow the younger ones to unpack the baskets, and arrange and serve everything. You will be surprised to see how easily and quickly they will manage everything. If you are too far away from every one to have a neighborhood picnic, have a family affair, and if you are alone quit work and take your dinner out under the blue sky, and after you have eaten, sing the Star Spangled Banner and all the patriotic songs you know. If you can't sing, make a speech—a good patriotic one—one that would give the world something to think about, if they could hear it. Any way do something to celebrate your country's birthday.—Elbepe.

YOUR OPPORTUNITY.

A servant with this clause
Makes drudgery divine;
Who sweeps a room, as for thy laws
Makes that and th' action fine.

—George Herbert.

For the Summer's Cooking



No kitchen appliance gives such actual satisfaction and real home comfort as the new Perfection Wick Blue Flame Oil Cook-Stove.

Kitchen work, this coming summer, will be better and quicker done, with greater personal comfort for the worker, if, instead of the stifling heat of a coal fire, you cook by the *concentrated* flame of the

NEW PERFECTION
Wick Blue Flame Oil Cook-Stove

Delivers heat where you want it—never where you don't want it—thus it does not overheat the kitchen. Note the CABINET TOP, with shelf for warming plates and keeping food hot after cooked, also convenient drop shelves that can be folded back when not in use, and two nickeled bars for holding towels.

Three sizes. With or without Cabinet Top. At your dealer's, or write our nearest agency.

The *Rayo LAMP* never disappoints—safe, economical and a wonderful light giver. Solidly made, beautifully nickeled. Your living-room will be pleasanter with a Rayo Lamp.

If not with your dealer, write our nearest agency.

CALIFORNIA'S NAVIGABLE RIVERS.

"The Sacramento, San Joaquin and Feather Rivers are the chief waterways of California, the navigable portions of the two former being largely limited to the tidal estuary channels. Low-water stages, therefore, do not seriously affect them, but their value for navigation has been menaced by silting. In addition, meandering of the streams has in cases taken place, threatening the destruction of riparian property as well as interfering with navigation.

"Three navigable streams heading in the western slope of the Sierra Nevadas have 492 miles of navigable water, or an average of 164 miles for each river. These streams differ from those of the southeasterly and eastern slope of the Rocky Mountains in possessing navigable estuary channels, while the precipitation on their basins is largely during the winter months, when it is often concentrated in heavy showers. The streams are subject to violent early spring freshets, originating in the heavy rains in the mountains, while their high silt burden has damaged the navigable estuary channels. The greater portion of the silt of these streams was formerly the product of hydraulic mining, but the necessary means have been taken to control this through settling beds. In spite of this the Sacramento River yet bears annually more than 2,250,000 tons of solid burden. Much of this is acquired in the foothills and plains, though much erosion takes place from forest land on account of the insufficient humus. Corrosion is active on the Tuolumne, Stanislaus, and other streams of the Sierras which debouch into the Sacramento or San Joaquin Rivers. This corrosive action is more or less constant, being a characteristic of streams coursing through unconsolidated soils or those deficient in cohesion, as are many of those of the California basin. This action might be lessened on the smallest tributaries by protective planting.—From Inland Waterways Report.

A strong effort was made to boost potato prices in the Seattle market and $50 per ton was reached which later dropped to $45 and then $40 which is the present price.

Visalia packing houses are busy with the shipping of the last Valencias.

Classified Liners

MACHINERY.

FOR SALE—RENT OR EXCHANGE, boilers and engines, gas engines, pipe and oil well casing, pumps, all sizes and makes; get our prices before you buy. A. CANNADY & CO., 691 N. Main St., Los Angeles, Cal.

Information That Is Worth
DOLLARS
To You

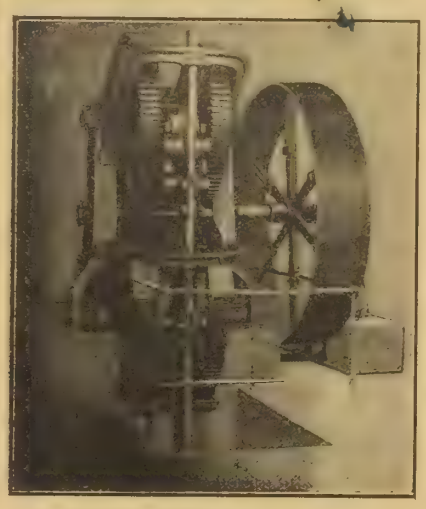
Isn't it worth money to know that with our patented vaporizer (found only on the Western) you will get from 25 to 30 per cent more power out of a gallon of low grade distillate than other engines get from a gallon of high grade gasoline? Five minutes' work with a scratch pad will show you what effect this will have on your fuel bills.

Ask us about the Nix-Frost Crude Oil Gas Producer, the cheapest power on earth using Crude Petroleum as fuel.

Western Gas Engine Company

Northern Branch: San Francisco, Cal. Los Angeles, California

The Smooth Running, Noiseless Pomona Deep Well Pump



It is thirty to fifty per cent more efficient than any centrifugal pump ever made. No high speed bearings to cut out. All breakages and rod troubles eliminated.

This is the only pump you can afford to buy if you consider your own interests. Hundreds of satisfied users testify to this.

Used by the best water companies who know what a good pump is.

Send for a catalog or what is better come to POMONA and let us show you some of these plants in operation.

POMONA MANUFACTURING CO.
POMONA, CALIFORNIA

THE
Latest Deep Well Turbine Pump

Guaranteed to deliver from 100 gallons per minute upwards, depending on the diameter and capacity of well, from a depth of 50 to 300 feet below the surface. Can be either belt driven or direct connected to electric motor as occasion requires.

Write for Catalogue 46B.

Byron Jackson Iron Works

A deep well pump that has no valves or plungers to wear or get out of order, no gears, consequently no noise or breaking of teeth.

Compact, durable, always primed and ready to operate, constant flow, hence increased capacity of well.

This type of pump is fast taking the place of Vertical Steam, Deep well Plunger and Propeller Pumps.

Main Office and Works:
